b.i.d.

The sensible schedule that covers the patient day and night

If your objective in the use of a broad-spectrum antibiotic is prolonged action, with high blood levels, then you know why b.i.d. DECLOMYCIN is considered to be a sensible dosage schedule.

The maintenance dosage of DECLOMYCIN can be kept at this convenient schedule because of its unusually high effective blood and tissue levels.

The b.i.d. dosage of DECLOMYCIN gives you the comfortable assurance that the patient is well-covered, *day and night.*

In clinical practice, blood levels produced by a therapeutic dose of DECLOMYCIN are high, prolonged, and effective; because of high serum binding and slow renal clearance. And if there's a broader susceptibility pattern of organisms, we've yet to see it.

There is no need to give higher daily dosage than 300 mg b.i.d., except in venereal diseases and Eaton Agent pneumonia.

DECLOMYCIN®
DEMETHYLCHLORTETRACYCLINE

Lederle

Prescribing information on next page.

b.i.d. The sensible schedule that covers the patient day and night

DECLOMYCIN Demethylchlortetracycline should be equally or more effective therapeutically than other tetracyclines when the offending organisms are tetracycline-sensitive.

Contraindication: History of hypersensitivity to demethylchlortetracycline.

Warning—In renal impairment, usual doses may lead to excessive accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated, and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort. Necessary subsequent courses of treatment with tetracyclines should be carefully observed.

Precautions—Overgrowth of nonsusceptible organisms may occure. Constant observation is essential. If new infections appear, appropriate measures should be taken. In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment.

Side Effects—Gastrointestinal system—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. Skin—maculopapular and erythematous rashes. A rare case of exfoliative dermatitis has been reported. Photosensitivity; onycholysis and discoloration of the nails (rare). Kidney—rise in BUN, apparently dose related. Transient increase in urinary output, sometimes accompanied by thirst (rare). Hypersensitivity reactions—urticaria, angioneurotic edema, anaphylaxis. Teeth— dental staining (yellow-brown) in children of mothers given this drug during the latter half of pregnancy, and in children given the drug during the neonatal period, infancy and early childhood. Enamel hypoplasia has been seen in a few children. If adverse reaction or idiosyncrasy occurs discontinue medication and institute appropriate therapy.

Average Adult Daily Dosage: 150 mg q.i.d. or 300 mg b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products. Treatment of streptococcal infections should continue for 10 days, even though symptoms have subsided.

In the treatment of syphilis a dosage schedule of a total of 12 to 18 Gm. given in equally divided doses over a period of 10 to 15 days should be followed. Close follow-up observation of the patient is recommended, including appropriate laboratory tests, since demethylchlortetracycline has not had adequate evaluation in all stages of syphilis. Spinal fluid examination should be included as part of this follow-up.

Acute gonococcal anterior urethritis in males has been treated effectively with a single dose of 600-900 mg. of DECLOMYCIN Demethylchlortetracycline. Individuals unable to tolerate large single doses due to gastrointestinal side effects may be treated with 150 mg. every 6 hours for a minimum of 4 doses or 300 mg. every 12 hours for a minimum of 2 doses. Females should be treated with a dosage of 150 mg. every 6 hours or 300 mg. every 12 hours until a cure is effected.

Primary Atypical Pneumonia (Eaton Agent): The average adult daily dosage is 900 mg. in 3 divided doses for six days.

170th ANNUAL MEETING OF THE M

Wednesday, Thursday

Sunday, April 2

A scientific program of wide interest to physicians in all fields of medicine, as well as to house officers and medical students, has been planned by the Committee on Program and Arrangements.

The scientific sessions will begin with a **Quiz The Experts** luncheon at the Sheraton-Belvedere Hotel on Wednesday, April 17, followed by **Lectures** at the Alcazar. On Thursday morning, there will be **Medical Grand Rounds** presented by The Johns Hopkins University School of Medicine, and a lecture by Doctor Maurice B. Strauss on "Chronic Nephritis Revisited". On Thursday afternoon **Surgical Grand Rounds,** presented by the University of Maryland School of Medicine, will be followed by a lecture at the Alcazar given by Doctor Arthur M. Vineberg on cardiac surgery. The scientific sessions of this Meeting will end at Friday noon, after three lectures of great interest.

Information about recent advances in medicine will be available through the **Scientific** and **Technical Exhibits,** which will be on display at the Alcazar. Each display will be manned by someone knowledgeable in the subject. Anyone wishing to have a scientific or technical exhibit at the Meeting should communicate with the Faculty office at

DICAL AND CHIRURGICAL FACULTY

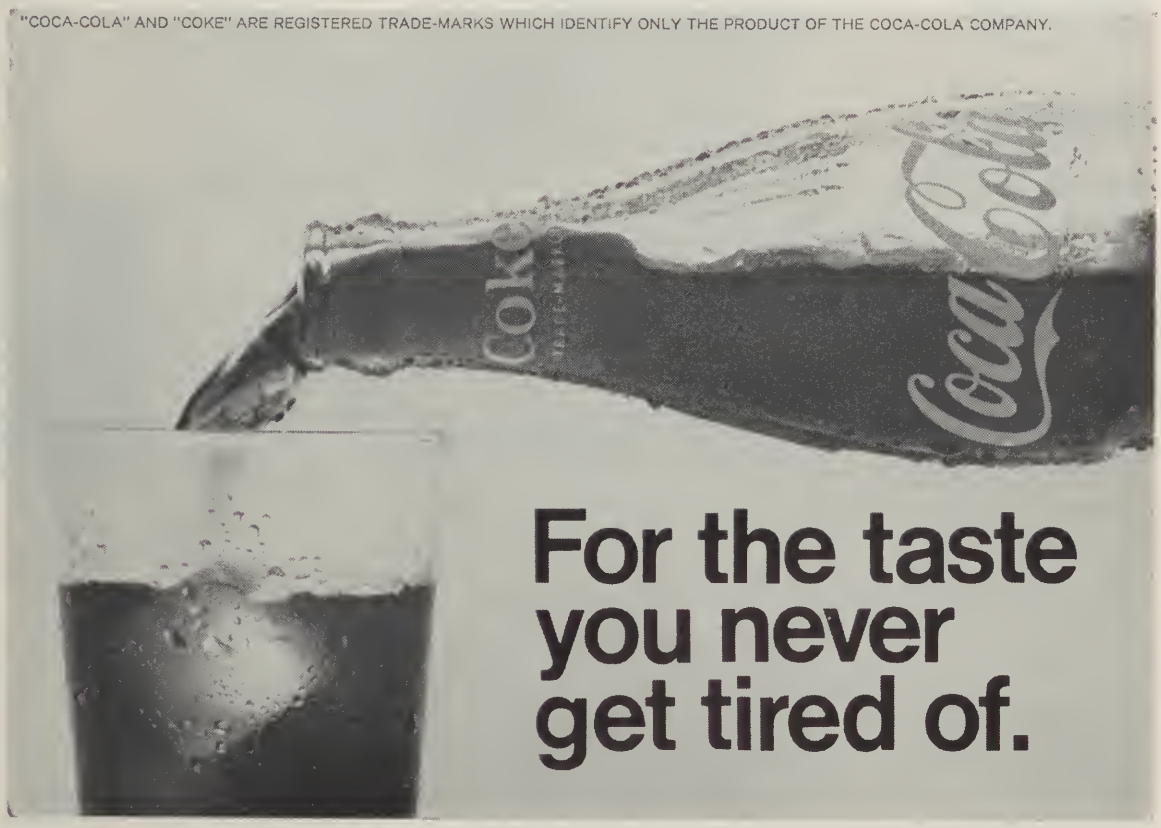
Friday, April 17, 18 ,19

to Sunday, April 28

once. There still may be a few booths unassigned.

As a benefit of membership, **Health Evaluation Tests** will be given again this year at the Alcazar to Faculty members and their families. These tests have become more popular each year with an ever increasing number of examinees.

An **AMA-ERF Theater Benefit** has been arranged by the Woman's Auxiliary for Wednesday evening at the Morris Mechanic Theater. The play will be the Broadway hit comedy, **"You Know I Can't Hear You When the Water's Running"** starring Eddie Bracken.



The annual **Presidential Reception and Dinner** will be held at the Sheraton-Belvedere Hotel on Thursday evening with Art Buchwald as the after dinner speaker.

The **House of Delegates** of the Faculty will meet on Wednesday morning and Friday afternoon.

The **Caribbean Cruise Convention** starts when the SS Argentina leaves Baltimore on Sunday, April 21, and will continue aboard ship and in San Juan and St. Thomas, until the ship returns to Baltimore on Sunday, April 28. There will be **daily Scientific Lectures and Films.**

ANNUAL MEETING CONTINUED ON CARIBBEAN CRUISE CONVENTION—APRIL 21-28, 1968

"COCA-COLA" AND "COKE" ARE REGISTERED TRADE-MARKS WHICH IDENTIFY ONLY THE PRODUCT OF THE COCA-COLA COMPANY.

TO SPEAK AT THE ANNUAL MEETING OF THE MEDICAL AND CHIRURGICAL FACULTY APRIL 17-28, 1968

CIRRHOSIS OF THE LIVER: A PANORAMIC VIEW will be the title of a paper to be presented at the Alcazar in Baltimore on Wednesday, April 17, by **CHARLES M. CARAVATI, MD.** Dr. Caravati has been Professor of Medicine and Assistant Dean in charge of Continuing Education at the Medical College of Virginia since January 1966. Prior to that he was in the private practice of internal medicine and gastroenterology in Richmond, Virginia. Dr. Caravati's undergraduate training was at the University of Richmond and he received his MD from the Medical College of Virginia. Following an assistant residency at Providence Hospital in Washington, D. C., he was on a fellowship in gastroenterology at The Johns Hopkins Hospital. Dr. Caravati has served as Governor, Regent, Vice President, and is now Master of the American College of Physicians.

Dr. Caravati

Dr. Harrison

THE SURGICAL MANAGEMENT OF DISORDERS OF THE ADRENAL CORTEX is the title of the first *Albert E. Goldstein Memorial Lecture* to be given at a meeting of the Medical and Chirurgical Faculty. **JOHN HARTWELL HARRISON, MD,** will give this lecture on Wednesday, April 17. Dr. Harrison, born and educated in Virginia, interned at Lakeside Hospital in Cleveland in internal medicine and took his surgical and urological training at the Peter Bent Brigham Hospital and Harvard Medical School. During 42 months in the Southwest Pacific in World War II, the Harvard Unit had close relations with both The Johns Hopkins and University of Maryland Units. Dr. Harrison is Chief of Urology at the Peter Bent Brigham Hospital and Elliott Carr Cutler Professor of Surgery in the Harvard Medical School. He is consultant in Urology to the Children's Medical Center, Boston Women's Hospital, the West Roxbury Veterans Administration Hospital and the Lemuel Shattuck Hospital.

CHRONIC NEPHRITIS REVISITED WILL BE THE TOPIC MAURICE B. STRAUSS, MD, will discuss at the Annual Meeting on Thursday morning, April 18. Dr. Strauss will review the subject of chronic nephritis, stressing that there is a benign form which is focal in nature, gives an alarming urinary sediment, but is consistent with long life. After graduating from The Johns Hopkins University School of Medicine, Dr. Strauss interned at the Boston City Hospital and subsequently was associated with the Thorndike Memorial Laboratory at the hospital and was a member of the Harvard Medical School Faculty. After concluding his military service during World War II in the Army Medical Corps, Dr. Strauss became the first Chief of Medicine at the Cushing Veterans Administration Hospital and moved to the Boston Veterans Hospital in the same capacity when that institution opened in 1952. He was Professor of Medicine at Boston University School of Medicine from 1952 to 1966. Over 100 articles written by Dr. Strauss have been published and those in recent years have been mostly concerned with renal physiology and disease and the mechanisms by which the volume of the body fluids is kept constant. He is author of several books on water and electrolyte metabolism and is co-editor of *Diseases of the Kidney*. In April 1968 a collection of over 7,000 *Familiar Medical Quotations*, which he has edited, will be published. Since January 1967, Dr. Strauss has been Professor of Medicine and Associate Dean of Student Affairs at Tufts University School of Medicine. He is also a lecturer on Medicine at Boston University School of Medicine and Harvard Medical School.

Dr. Strauss

Additional information available to physicians upon request. Eli Lilly and Company, Indianapolis, Indiana 46206.

800192

Don't let monilia cut broad-spectrum therapy short...

start with Tetrex-F®

tetracycline phosphate complex-nystatin

Use of broad-spectrum antibiotics can cause fungal overgrowth in the alimentary tract... and give rise to symptoms so troublesome that therapy must be prematurely stopped. Tetrex-F (tetracycline phosphate complex-nystatin) helps you circumvent this problem.

The nystatin can prevent overgrowth of monilia; the phosphate complex delivers tetracycline to the blood rapidly. Side effects are infrequent.

High-Risk Patients

Tetrex-F (tetracycline phosphate complex-nystatin) is especially useful in patients most susceptible to fungal overgrowth during tetracycline therapy: (1) the elderly or debilitated, (2) young children, (3) the diabetic, (4) those on long-term tetracycline therapy, (5) those on steroid therapy, (6) those who have had moniliasis before, and (7) pregnant patients with a history of monilial vaginitis.

When you start with economical Tetrex-F (tetracycline phosphate complex-nystatin), you can complete the full course of broad-spectrum therapy with less chance of losing control elsewhere. A good start for a healthy finish.

PRESCRIBING INFORMATION. For complete information consult Official Package Circular. *Indications:* Infections of respiratory, gastrointestinal and genitourinary tracts and skin and soft tissues due to tetracycline-sensitive organisms, in patients with increased susceptibility to monilial infections. *Contraindications:* The drug is contraindicated in patients hypersensitive to its components. *Warnings:* Photodynamic reactions have been produced by tetracyclines. Natural and artificial sunlight should be avoided during therapy. Stop treatment if skin discomfort occurs. With renal impairment, systemic accumulation and hepatotoxicity may occur. In this situation, lower doses should be used. Tooth staining and enamel hypoplasia may be induced during tooth development (last trimester of pregnancy, neonatal period and childhood). *Precautions:* Bacterial superinfections may occur. Infants may develop increased intracranial pressure with bulging fontanels. In gonorrheal therapy, serologic tests for syphilis should be conducted initially and monthly for 3 months. *Adverse Reactions:* Glossitis, stomatitis, nausea, diarrhea, flatulence, proctitis, vaginitis, dermatitis, and allergic reactions may occur. *Usual Adult Dosage:* 1 capsule q.i.d. Continue for 10 days in Beta-hemolytic streptococcal infections. Administer one hour before or two hours after meals. *Supplied:* Capsules, bottles of 16 and 100. Each capsule contains tetracycline phosphate complex equivalent to 250 mg. tetracycline HCl activity and 250,000 units of nystatin. For Oral Suspension, 125 mg. tetracycline and 125,000 u. nystatin/5 ml., 60 ml. bottles.

PROFESSIONAL COURTESY—

Should the time-honored custom of professional courtesy be extended without limits to all physicians and their immediate families, or should its application vary according to circumstances?

What about the psychiatrist, for example? Should he render his services without any fee whatsoever when long-range care involving one or two hours weekly of his restricted patient load is involved?

What about the obstetrician in the college town who has the wives of all medical students—a significant percentage of his practice—as his patients?

What about the ophthalmologist who is called upon to fit contact lenses for a physician's entire family?

If no fee would have been charged, had the patient been without medical-hospitalization insurance, would it be considered proper to accept insurance payments for the professional services provided?

Because of the increasing specialization in medicine and continuing changes in medical practice, the AMA's Judicial Council has been swamped with requests to clarify its position on professional courtesy.

To provide physicians with guidance on the matter of professional courtesy, the Judicial Council adopted the following opinion:

The custom of professional courtesy embodies the ancient tradition of fraternalism among physicians in the art which they share, and their mutual concern to apply their learning for the benefit of one another as well as their patients. The Judicial Council reaffirms and endorses the principle of professional courtesy as a noble tradition that is adaptable to the changing scene of medical practice.

Professional courtesy is not a rule of conduct to be enforced under threat of penalty of any kind. It is the individual responsibility of the physician to determine for himself and within his own conscience to whom and the extent to which he shall allow a discount from his usual and customary fees for the professional services he renders, and to whom he shall render such services without charge as professional courtesy.

The following guidelines are offered as suggestions to aid physicians in resolving questions related to professional courtesy.

WHERE DO YOU DRAW THE LINE?

1. Where professional courtesy is offered by a physician but the recipient of services insists upon payment, the physician need not be embarrassed to accept a fee for his services.

2. Professional courtesy is a tradition that applies solely to the relationship that exists among physicians. If a physician or his dependents have insurance providing benefits for medical or surgical care, a physician who renders such service may accept the insurance benefits without violating the traditional ethical practice of physicians caring for the medical needs of colleagues and their dependents without charge.

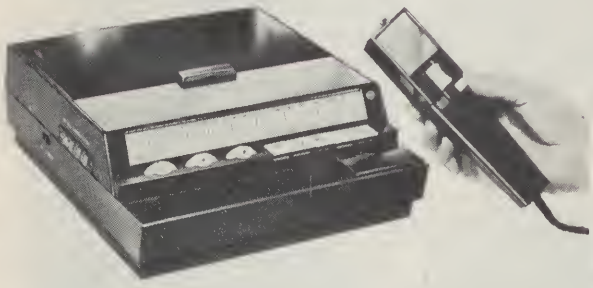
3. In the situation where a physician is called upon to render services to other physicians or their immediate families with such frequency as to involve a significant proportion of his professional time, or in cases of long-term extended treatment, fees may be charged on an adjusted basis so as not to impose an unreasonable burden upon the physician rendering services.

4. Professional courtesy should always be extended without qualification to the physician in financial hardship, and members of his immediate family who are dependent upon him.

"All Interns are Alike"

It stands to reason. They all go through the same training; they all have to pass the same tests; they all have to measure up to the same standards; they all are underpaid, too. Therefore, all interns are alike.

That's utter nonsense, of course. But it's no more nonsensical than what some people say about aspirin. Namely: since all aspirin is at least supposed to come up to certain required standards, then all aspirin tablets must be alike.



Bayer's standards are far more demanding. In fact, there are at least *nine specific differences* involving purity, potency and speed of tablet disintegration. These Bayer® standards result in significant product benefits including gentleness to the stomach, and product stability that enables Bayer tablets to *stay* strong and gentle until they are taken.

So next time you hear someone say that all aspirin tablets are alike, you can say, with confidence, that it just isn't so.

You might also say that all interns aren't alike, either.

How come the world's richest companies buy the lowest priced dictating machine?

Eastern Airlines, Union Carbide or Gulf could easily afford any of the six nationally advertised dictating machines priced from $249.50 to $800. Yet they, as well as Ford, American Airlines, Allied Chemical, United States Lines, Goodyear Tire & Rubber, Home Life and many other giants of business, are buying the new Voca at $199.95. Could it be that the Voca is just as good, regardless of price? Or perhaps even better? Find out. We'll be glad to give you the full story. Phone, or mail the coupon today.

Alfred S. Bright, C.L.U.
Agency Manager,
HOME LIFE INSURANCE CO., N.Y.

"In our offices, we need dictating equipment we can depend on . . . that's why we selected VOCA."

Voca Patent Nos. 3,243,133; 199,189, other patents pending.

Only $199.95 complete with dictating or transcribing accessories.

Why? I want to know why experts choose the Voca dictating/transcribing machine over more expensive makes. Please send me full details and full color brochure.

THE PHYSICIAN'S CAREER

A NEW AMA PUBLIC

Despite the remarkable changes that have occurred in patterns of medical practice, the enormous expansion of professional and occupational resources on the allied health team and the explosive growth of community health services involved in total health care within the past generation, few changes have been made in the medical school curriculum to help prepare the new physician to grasp, appreciate and meet these accelerating socio-economic challenges once he enters practice.

As a step toward surmounting this educational void, the American Medical Association has developed a new publication, *The Physician's Career,* a 99-page handbook intended to serve as a teaching outline on medical practice and community relations for physicians and medical students.

More than two years in the making, *The Physician's Career* was the direct result of suggestions made at recent meetings of the House of Delegates that teaching outlines of informative material on medical ethics, medical civics and socio-economic aspects of medical practice be provided to medical schools and medical societies for orienting students and recent graduates to nonscientific aspects of the physician's career.

Fifteen AMA departments and a task force of staff consultants cooperated in producing *The Physician's Career,* the most significant publication covering this broad subject since Joseph Garland, MD, Boston, introduced *The Physician and His Practice* in 1954, Henry F. Howe, MD, Director of the Department of Occupational Health, served as coordinating editor.

Prepared in narrative outline form, *The Physician's Career* is comprised of 15 chapters, divided into two parts—The Practice of Medicine and The Physician in the Total Community.

The handbook focuses upon the sharp transition which has occurred since two generations ago when the unaided physician was almost the only health resource in the community.

■ to help restore and stabilize the intestinal flora

■ for fever blisters and canker sores of herpetic origin

LACTINEX contains both *Lactobacillus acidophilus* and *L. bulgaricus* in a standardized viable culture, with the naturally occurring metabolic products produced by these organisms.

First introduced to help restore the flora of the intestinal tract in infants and adults,[1, 2, 3, 4] LACTINEX has also been shown to be useful in the treatment of fever blisters and canker sores of herpetic origin.[5, 6, 7, 8]

No untoward side effects have been reported to date.

Literature on indications and dosage available on request.

TION FOR PHYSICIANS

It calls attention to the fact that the short-term general hospital, once a place of last refuge for the terminally ill, has emerged into a highly organized, complex institution serving as a center of medical practice and providing the supporting services demanded by modern medical care.

A major change, the book points out, is the rapid evolution of group practice. Since 1948, when 3,493 physicians practiced in 368 groups, the number in group practice had more than septupled to approximately 26,000 by 1965 and is continuing to accelerate, according to preliminary information gathered in a detailed survey now being conducted by the AMA.

Chapter topics of Part One are Patterns of Medical Practice, Licensure and Accreditations, Organizations of the Health Professions, Medical Ethics, Medical Staff Organizations and Responsibilities, Teaching and Research, Business Aspects of Medical Practice and Medicolegal Obligations and Relations.

Chapter topics of Part Two are Community Health Services, Voluntary Health Agencies, Governmental Health Programs, The Modern Public Health Movement, Voluntary Health Insurance and Prepayment Plans, Medical Cultism and Quackery, and Personal, Family and Civic Responsibilities.

The AMA is encouraging state and county medical societies to utilize *The Physician's Career* as a springboard of ideas for orientation seminars for newly installed members. Copies are being provided free to members of this year's senior medical school classes. Review copies are being sent to all state and county medical societies and medical schools.

Single copies are available at 75 cents from the AMA Order Department; 90 cents in all countries except the U. S., its possessions, Canada and Mexico. A reduced price of 45 cents a copy has been set for medical students, interns and residents.

SKIN PROBLEMS

Caused by itching due to:

Dry Eczema	Acne
Chafing	Ivy Poisoning
Minor Burns	Cold Sores
Athlete's Foot	Heat Rash
Dry Skin	Diaper Rash
Wind Burn	Chapping
Insect Stings	Hemorrhoids

For Safe, Sure, Speedy Relief—
—Get RESINOL GREASELESS!

Medical Scientists have conquered 6 dread diseases in the past decade, but they are largely in the dark, they admit, in finding relief for one age-old ailment—itching

New remedies containing antibiotics have been tested, but have often caused side effects which are worse than itching skin. After many years of research and testing, **Resinol Greaseless Cream** was developed. . . . A doctor's formula containing safe yet powerful ingredients, **Resinol Greaseless** contains an amazing, proven "anti-itch" medication called Resorcin, which quickly and effectively relieves most any kind of itching. Try **Resinol Greaseless** . . . You'll be delighted to find that it really works! At all drug stores. Buy a tube today.

EXECUTIVE SECRETARY'S NEWSLETTER

January, 1968

ANNUAL MEETING RESOLUTIONS

Resolutions to be considered by the Faculty's House of Delegates at its Annual Meeting, April 17 - 19, 1968, must be received in the Faculty office NO LATER THAN Wednesday, February 21, 1968.

To date, the only resolution to be considered is as follows:

Resolution 1A/68 - Condemning Attempts by Insurance Carriers to Determine Qualifications of Physicians; and Requesting that such Carriers amend their Regulations to Prevent This.

This resolution is identical to one considered at the 1967 annual meeting, and rejected. It is being reintroduced by the Prince George's County Medical Society.

REFERENCE COMMITTEE HEARING

The Reference Committee meeting to hear comments from all interested parties to resolutions for consideration of the Faculty's House of Delegates has been scheduled for:

WEDNESDAY, MARCH 13, at 8:00 P.M.

Copies of resolutions may be obtained from the Faculty office.

1968 DUES BILLS

Dues bills for 1968 dues have been mailed to all members. Physicians are again reminded that payment of dues must be made BEFORE JANUARY 31, in order to be eligible for Physicians' Defense.

The Council has ruled that strict interpretation of the Faculty's Bylaws will preclude authorization of this benefit of membership for those members who have not complied with this requirement.

CHARTER TRIP TO LONDON

Some seats are still available on the Faculty's Jet Charter trip from Friendship airport to London's Heathrow airport. Departure is set for February 4 and return on February 10.

The all-inclusive tour, including round trip jet air fare, hotel accommodations, land arrangements and meals, is $289.00. Reservations may be made through Travel Guide Agency, Mrs. Beverly Wolins, 727-0682.

NEWS NOTES

Mikio Kato, M.D., LaVale, has been certified as a Diplomate of the American Board of Obstetrics and Gynecology.

Gilbert Barkin, M.D., Silver Spring, has been elected Chairman of the Section on Allergy of the Southern Medical Association.

Gerald A. Galvin, M.D., Baltimore, has been selected to fill the vacancy on the Board of Medical Examiners created by the death of Frank K. Morris, M.D.

New Officers of the Board are: Vernon H. Norwood, M.D., President; Karl F. Mech, M.D., Vice-President; and Walter C. Merkel, M.D., Secretary-Treasurer.

Thomas H. Powell, M.D., and Michael B. Flynn, M.D., both from Baltimore, are presently serving as Volunteer Physicians in Viet Nam, through the American Medical Association's program.

George W. Borkovic, M.D., has been elected President of the medical staff at Franklin Square Hospital. Other officers are Jesse N. Borden, M.D., Vice-President; and Nathan E. Chiodi, M.D., Secretary-Treasurer.

Winthrop M. Phelps, M.D., of Baltimore, was honored recently at a testimonial dinner in recognition of his many contributions in the field of cerebral palsy. A plaque was presented to Dr. Phelps on behalf of the American Medical Association by Houston S. Everett, M.D., Faculty Vice-President.

MEDICAL SCHOLARSHIPS

The ten State Senatorial scholarships for 1967 have been awarded to Maryland residents for their attendance at the University of Maryland Medical School. The scholarships were created by the 1965 Maryland State Legislature.

John Sargeant

Executive Secretary

Serving the Medical Profession for Almost Half a Century

Introducing an investment philosophy that separates the men from the boys. Mercantile's new Investment Management Service.

When the idea of getting a safe, nominal return no longer appeals to you...when you're tired of seeing inflation outperform your portfolio or hearing about moves that you could have made last year... when you decide that chasing after "hot" stocks isn't the way you want to spend your life...then you're probably ready for Mercantile's new investment advisory service. We call it IMS, Investment Management Service. You may call it the smartest thing you ever did.

IMS is a counseling service designated for businessmen, professional men, and performance-oriented investors who are willing to take more risk to go after more gain. How much risk? That's up to you...and your Mercantile advisor. IMS is not a fixed, inflexible investment plan. It's not a mutual fund. It's a personally-tailored individual counseling service to meet your own particular needs and objectives. The actual combination of defensive-aggressive investment evolves from a study of your situation, your ambitions and your ability to risk.

If IMS sounds like the kind of investment counsel you've been waiting for, it's waiting for you at Mercantile. Call Mr. William Morrill for more details. Telephone 539-1040, Extension 216. Or if you're not in all that much of a hurry write for the comprehensive brochure on IMS.

Members of the Baltimore Association of Medical Assistants planned a project to send Christmas boxes to soldiers stationed in Viet Nam. It was decided that many of the men stationed in the war zone had families to remember them during the holidays and therefore the aim would be to reach men without families.

BAMA Christmas Project committee members (l. to r.) Mrs. Barbara Daniel, chairman; Miss Laura Baer, Mrs. Arlene Whalen and association president, Mrs. Nell Chaney, busily stuff stockings.

CHRISTMAS REMEMBRANCES TO VIET NAM

Chaplain Major Ray E. Miller, of the U. S. Army, on duty in the war zone, readily agreed to distribute these packages so they would not fall into the hands of the black marketeers or the Viet Cong and also so they would reach men that he personally knew would greatly appreciate them.

The Wicomico and Allegany Associations of Medical Assistants were invited to join in the project. A total of nine cartons comprising the donations of Baltimore City and Wicomico Associations were mailed to Chaplain Miller. Each box weighed in the vicinity of 30 pounds. Donations from the Allegany Association were mailed direct.

This was a most rewarding enterprise. The majority of the contributions came from neighborhood druggists, bakeries, pharmaceutical houses and some private contributions of money by members and doctors. A most touching contribution came from the members of the Housekeeping Department of Church Home and Hospital. At the suggestion of the Executive Housekeeper, Mr. William Milliken, whose son is now in Viet Nam, the department made this their Christmas project. These good people contributed the thirty-five dollars necessary to mail the packages overseas. Without them, the whole project would have foundered.

The packages contained such articles as razors, razor blades, candies, pens, pencils, cards, writing paper, soap, toothpaste, toothbrushes, nail clippers, small games, books, shaving supplies, deodorants, talcum, powdered hot chocolate and fruit drinks, fruitcakes, cigarette lighters, cigars, tobacco, and other such items. As originally planned, we were to try to send large packages to only three soldiers to be chosen by Chaplain Miller. Then one smaller box was sent as a small thank-you gift to the Chaplain for his help. After these boxes were prepared, there was a great supply left and so 25 giant felt Christmas stockings were purchased and packed with smaller quantities of each of the above articles. Then two cartons of books were sent and finally, one large carton of 150 small fruitcakes donated by a bakery in Baltimore, were sent for distribution as the Chaplain saw fit.

A letter was received on November 27th by our President, Mrs. Nell Chaney, which read:

> "The package marked for my personal use was received on November 19th. Thank you very much. I shall put the package away until Christmas. I shall write and let you know as the packages are received.
>
> "*You* may consider your remembrances as small, but the joy brought to the soldiers will be great. If we were to stop and think, it is the small things in life that make living so meaningful.
>
> Yours in His service,
> Chaplain Miller"

THE HIDDEN VALUE OF ADS

Recently two of our sister journals carried editorials dealing with the hidden value of drug advertising. These journals pointed out that the physician too frequently misunderstands the role that journal advertising plays.

He believes, too frequently, that the only role is a financial one for the journal he reads. He has forgotten, if he ever thought about it, that these ads carry a great deal of knowledge and information on drugs presented in a desirable and attractive manner, all available for easy reading.

All advertisements carried in medical journals are carefully screened first by the advertising departments of the drug houses and their agencies. A great amount of detail, planning, research and expertise go into the copy to ensure it is effective, ethical and legal. This requires an intimate knowledge of the product, the needs of the physician and patient, and the requirements of governmental agencies.

Perhaps he has forgotten as well that these ads are a vital source of information regarding new products and products tested by time.

Perhaps he has forgotten that these ads, in addition to providing information in themselves, provide the vehicle for the scientific material carried in papers presented at medical meetings—another important source of new information to physicians.

Rather than being critical of the advertising space purchased by drug manufacturers, the physician should be glad that they are anxious and willing to help him in the highest ethical manner.

emesis control

treat one . . . six people benefit

The brunt of senility falls on the family as much as the patient. But usually within one or two days, 'Thorazine' can control senile anxiety and fear . . . dispel the confusion shown by nighttime wandering and chattering . . . restore appetite and interest in personal grooming. Treat the senile patient with 'Thorazine'—the whole family can benefit.

Before prescribing, see complete information, including adverse effects reported with phenothiazines and symptoms and treatment of overdosage, in SK&F literature or *PDR*. The following is a brief precautionary statement.

Contraindications: Comatose states or the presence of large amounts of C.N.S. depressants.

Precautions: Potentiation of C.N.S. depressants may occur (reduce dosage of such agents when used concomitantly). Use with caution in patients with chronic respiratory disorders. Antiemetic effect may mask overdosage of toxic drugs or obscure other conditions. Administer in pregnancy only when necessary. Because of possible drowsiness use cautiously and warn patients who operate vehicles or machinery.

Adverse Reactions: Drowsiness; dry mouth; nasal congestion; constipation; amenorrhea; miosis; mild fever; weight gain; hypotensive effects, sometimes severe with I.M. administration; epinephrine effects may be reversed; dermatological reactions; parkinsonism-like symptoms on high dosages (in rare instances, may persist); lactation and moderate breast engorgement (in females on high dosages); and less frequently, cholestatic jaundice (use cautiously in patients with liver disease). Adverse reactions occurring rarely, include: mydriasis; agranulocytosis; skin pigmentation; epithelial keratopathy; lenticular and corneal deposits (after prolonged substantial doses).

Available: Tablets, 10 mg., 25 mg., 50 mg., 100 mg. and 200 mg.; Spansule® capsules, 30 mg., 75 mg., 150 mg., 200 mg. and 300 mg.; Injection, 25 mg./cc.; Syrup, 10 mg./5 cc.; Suppositories, 25 mg. and 100 mg.

Book Reviews

THE OFFICE ASSISTANT IN MEDICAL PRACTICE, by Portia M. Frederick and Mary E. Kinn, CPS, W. B. Saunders Company, Philadelphia, Pa.

This is the third edition of a volume first published in 1956.

The girl who works in a medical office often must serve in many capacities. She may be a receptionist, secretary, bookkeeper and technician as well as medical assistant. Because of this, she must have a wide variety of skills and a thorough grasp of a great deal of information. She must be trained to handle each aspect of her work dependably and proficiently.

This book is designed essentially as a teaching aid in training programs for medical assistants. However, it can also serve as a handy reference book for many of the aides who have never had any formal training and have learned the tools of their trade, "on the job."

The major objectives of the book are summed up in the first paragraph of the objectives of the American Association of Medical Assistants: "To inspire its members to render honest, loyal and more efficient service to the profession and to the public which they serve."

It is a worthwhile book to have in every doctor's office.

LABORATORY MEDICINE—HEMATOLOGY, John B. Miale, MD; The C. V. Mosby Company, St. Louis, Mo.

This third edition brings up-to-date the many laboratory procedures that have been improved upon since the last publication of this book. This edition contains roughly twice the illustrations as the last; the methodology section has been revised and expanded and historical introductions have been added to various chapters. It is a worthwhile text for many physicians' offices.

CARDIOVASCULAR PHYSIOLOGY, Robert M. Berne, MD, and Matthew N. Levy, MD; The C. V. Mosby Company, St. Louis, Mo.

This book, designed for medical and graduate students, has a fundamental purpose in mind—an attempt to emphasize general concepts and to ignore isolated facts, except where they are deemed to be essential.

Simplified models have been used throughout the book, therefore, the reader must constantly remind himself of the assumption inherent in a given model and must decide whether a more detailed model is necessary at times in order to understand the specific problem with which he happens to be concerned.

The book is an excellent one for any physician to add to his library.

ATLAS OF STRABISMUS, Gunter K. von Noorden, MD, and A. Edward Maumenee, MD; The C. V. Mosby Company, St. Louis, Mo.

The diagnosis of strabismus, including its sensory adaptations and motor characteristics, depends on thorough examination and correct interpretation of a great number of subjective and objective tests. In recent years our diagnostic resources have become enlarged and refined by new procedures, and new information on the nature of sensory adaptations in strabismus has necessitated a different interpretation of some of the older tests.

This atlas does not attempt to fill the need for a comprehensive textbook on strabismus; rather it illustrates and provides basic information for the examination and diagnosis of strabismic patients in light of present knowledge.

Radio Paging... for just pennies a day

DORSEY "FLU-GRAM"

DON'T BE LULLED BY RELATIVE LACK OF FLU LAST WINTER. THIS WINTER BE PREPARED: WHEN THE COMPLAINTS ARE COUGH AND CONGESTION, YOU CAN RELIEVE THESE SYMPTOMS WITH TUSSAGESIC TABLETS. ONE TIMED-RELEASE TABLET AT MORNING, MIDAFTERNOON AND BEDTIME BRINGS UP TO 24 HOURS' RELIEF FROM TROUBLESOME COUGH AND STUFFED AND RUNNY NOSE. TUSSAGESIC IS THE FAMOUS TRIAMINIC FORMULA, PLUS THREE OTHER PROVED CONSTITUENTS. MAKES PATIENTS MORE COMFORTABLE. FAST. ASK YOUR DORSEY REPRESENTATIVE FOR SUPPLY OF STARTER SAMPLES, OR IF FLU IS ALREADY EPIDEMIC, PHONE COLLECT. SEE BELOW.

each

Tussagesic®

timed-release tablet contains:

Triaminic® (phenylpropanolamine hydrochloride 25 mg., pheniramine maleate 12.5 mg., pyrilamine maleate 12.5 mg.)	50 mg.
Dextromethorphan hydrobromide	30 mg.
Terpin hydrate	180 mg.
Acetaminophen	325 mg.

Dosage: Adults—1 tablet, swallowed whole to preserve timed-release feature, in morning, midafternoon and at bedtime. Side effects: Occasional drowsiness, blurred vision, cardiac palpitations, flushing, dizziness, nervousness or gastrointestinal upsets. Precautions: The patient should be advised not to drive a car or operate dangerous machinery if drowsiness occurs. Use with caution in patients with hypertension, heart disease, diabetes or thyrotoxicosis.

consider

LETTER®

(SODIUM LEVOTHYROXINE, ARMOUR) TABLETS

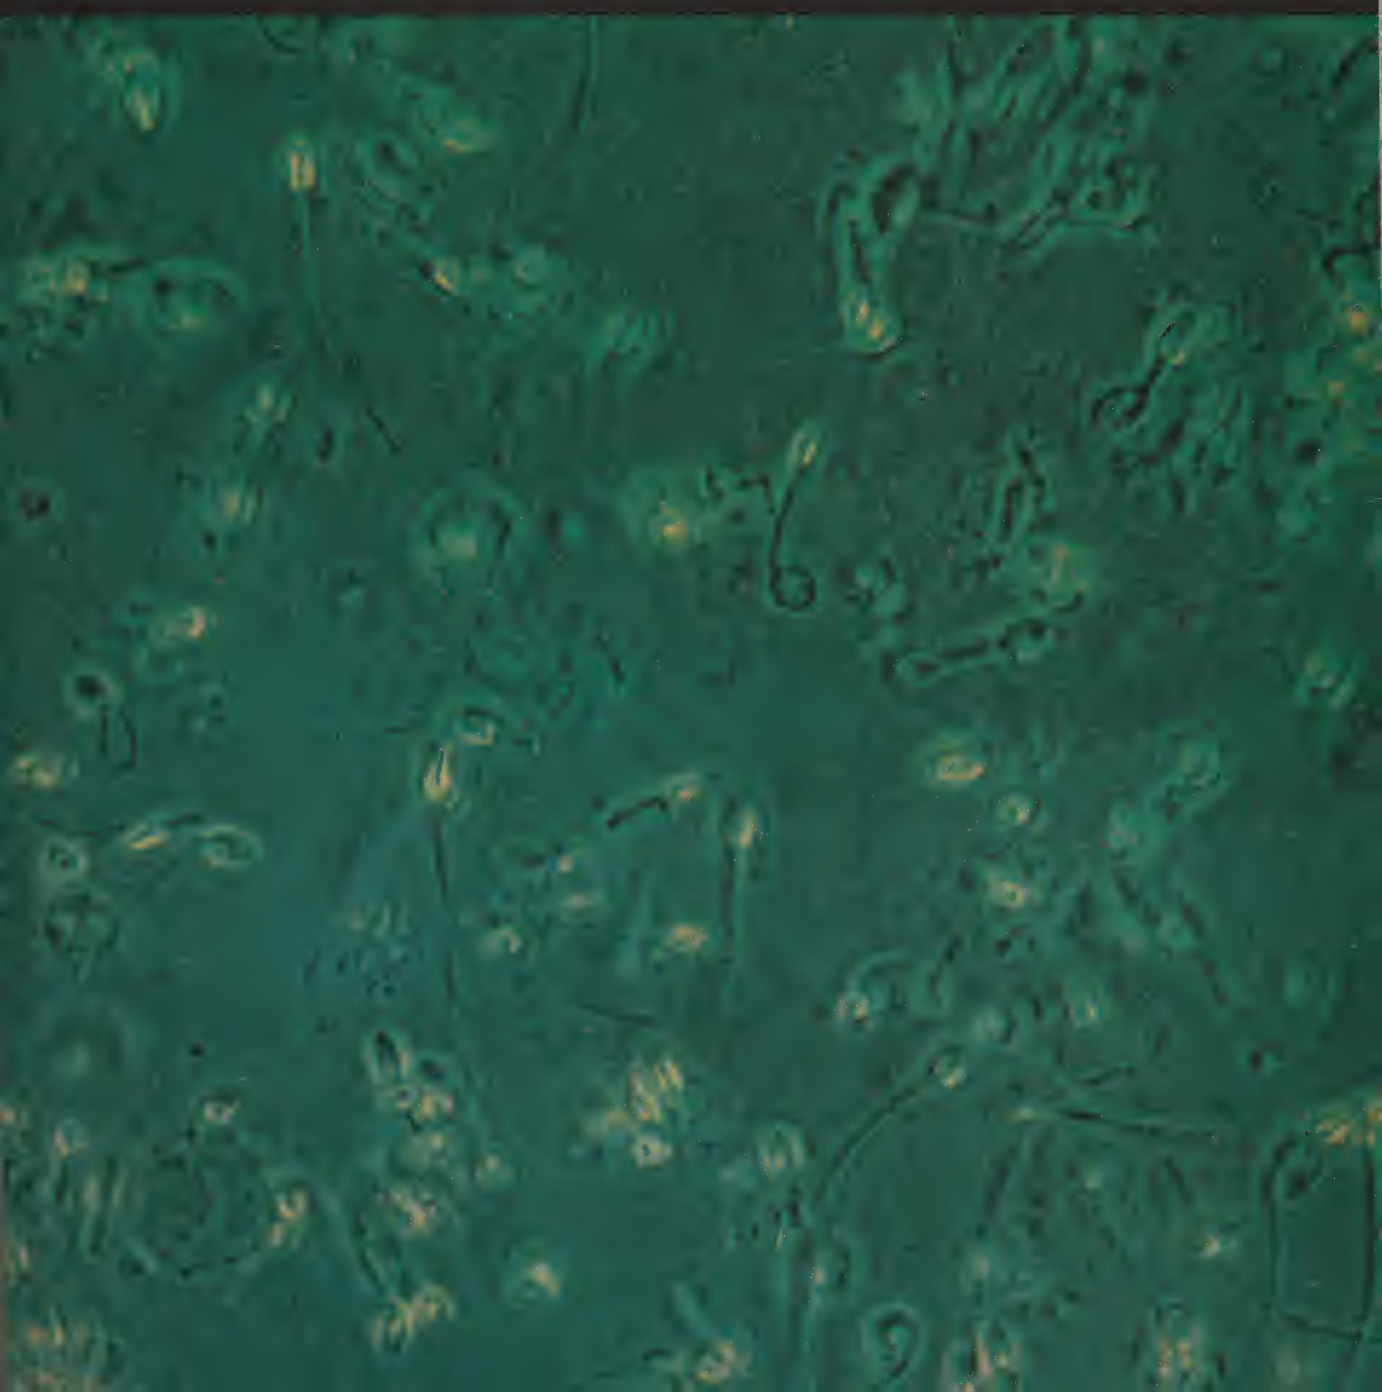
Synthetic Thyroid Replacement Therapy

Letter® provides all the advantages of the synthetically pure chemical sodium levothyroxine. Dosage is precise and potency is consistently uniform.

and

Letter® is micronized to provide maximum opportunity for full absorption and clinical response.

In addition Letter® is distinctively color coded with an identifying number stamped on each tablet to provide accurate dosage control.



Indications: Hypothyroid conditions. **Contraindications:** Thyrotoxicosis, acute myocardial infarctions unless associated with hypothyroidism. In hypothyroidism with hypoadrenalism coadministration of corticoids with LETTER® is recommended. **Precautions and Side Effects:** Excessive dosage may result in diarrhea, cramps, palpitation, nervousness, rapid pulse, sweating. If symptoms appear, discontinue medication for several days, then reinstitute at a lower level. Since myxedema patients with heart disease may suffer seriously from abrupt increases in dosage, caution should be exercised in adjusting dosage. **Dosage:** Generally, the initial adult dosage is 0.1 mg. daily. This may be increased in small increments every one to three weeks until proper metabolic balance is achieved. **Available:** Bottles of 100 tablets, in six potencies: 0.025 mg. (violet), 0.05 mg. (peach), 0.1 mg. (pink), 0.2 mg. (green), 0.3 mg. (yellow), and 0.5 mg. (white).

ARMOUR PHARMACEUTICAL COMPANY • CHICAGO, ILLINOIS

When the talk turns to oral contraceptives, it makes medical sense to remember low-dose Norinyl®-1.

(norethindrone 1mg. c mestranol 0.05mg.)

Turn page for contraindications, precautions and side effects.

Reduction of oral contraceptive dosage to the lowest effective levels is a well-accepted principle of conservative medical practice. In keeping with this view, Norinyl is now also available as Norinyl-1, containing exactly one half the previous dosage of norethindrone and mestranol. Clinical experience has established that effective fertility control can be achieved with the same degree of reliability and safety with new Norinyl-1 when taken as directed.

What about switching patients from higher dosage forms?

In transferring patients to low-dose Norinyl-1 from higher-dosage oral contraceptives, some breakthrough bleeding may occur in the early cycles. In the majority of cases the bleeding episode is mild and self-limited. The long-term advantages of the lower dosage form should be weighed against the inconvenience of possible breakthrough bleeding in the individual patient.

Prescribing Information

Contraindications: Patients with any symptoms or history of thrombophlebitis, pulmonary embolism, liver dysfunction or disease, carcinoma of breast or genital organs, or undiagnosed vaginal bleeding.

Warnings: Discontinue medication pending examination if there is sudden partial or complete loss of vision, proptosis, diplopia or migraine. If examination reveals papilledema or retinal vascular lesions, medication should be withdrawn. The safety of Norinyl-1 in pregnancy has not been demonstrated. If a patient misses two consecutive periods, pregnancy should be ruled out before continuing the medication. If she has not adhered to the prescribed schedule, pregnancy should be considered at the first missed period. Active ingredients of oral contraceptives have been detected in the milk of mothers who received these drugs; the significance to infants has not been determined.

Precautions: Pretreatment physical should include examination of the breasts and pelvic organs, as well as a Papanicolaou smear. If endocrine or liver function tests are abnormal during therapy, repeat tests are recommended after the drug has been withdrawn for two months. Following administration of drug, preexisting uterine fibromyomata may increase in size. Careful observation and caution are required for patients with symptoms or history of epilepsy, migraine, asthma, cardiac or renal dysfunction, cerebrovascular accident, psychic depression, and diabetes. In cases of undiagnosed vaginal bleeding, adequate diagnostic measures are indicated. Possible long-term effects of the drug on pituitary, ovarian, adrenal, hepatic or uterine function must await further studies. The physician should be alert to the earliest manifestations of thrombophlebitis and pulmonary embolism. The drug should be used judiciously in those young patients in whom bone growth is not complete. The age of the patient constitutes no absolute limiting factor, although treatment with Norinyl-1 may mask symptoms of the climacteric. The pathologist should be advised of Norinyl-1 therapy when relevant specimens are submitted.

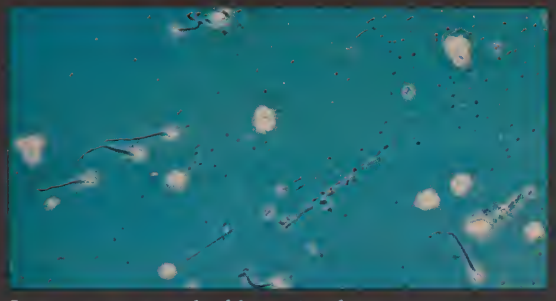
Side Effects: The following have been observed with varying incidence in patients receiving oral contraceptives: nausea, vomiting, gastrointestinal symptoms, breakthrough bleeding, spotting, change in menstrual flow, amenorrhea, edema, chloasma or melasma, breast changes (tenderness, enlargement and secretion), change in weight (increase or decrease), changes in cervical erosion and cervical secretions, suppression of lactation when given immediately postpartum, cholestatic jaundice, migraine, rash (allergic), rise in blood pressure in susceptible individuals, mental depression. Although the following side effects have been reported in users of oral contraceptives, no cause and effect relationship has been established: anovulation posttreatment, premenstruallike syndrome, changes in libido, changes in appetite, cystitis-like syndrome, headache, nervousness, dizziness, fatigue, backache, hirsutism, loss of scalp hair, erythema multiforme, erythema nodosum, hemorrhagic eruption, and itching. The following occurrences have been observed in users of oral contraceptives (a cause and effect relationship has neither been established nor disproved): thrombophlebitis, pulmonary embolism, neuroocular lesions.

The following laboratory tests may be altered by the use of oral contraceptives: increased sulfobromophthalein and other hepatic function tests, coagulation tests (increase in prothrombin, factors VII, VIII, IX and X), thyroid function (increase in PBI and butanol extractable protein-bound iodine and decrease in T^3 values), metyrapone test, pregnanediol determination.

norethindrone — an original steroid from

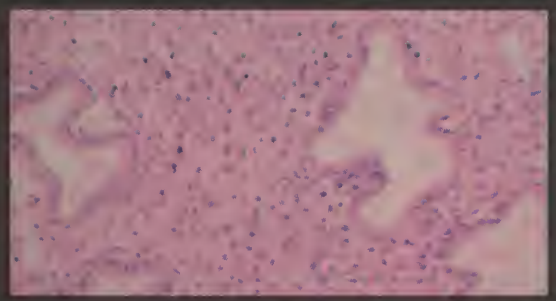
SYNTEX

LABORATORIES INC., PALO ALTO, CALIF.



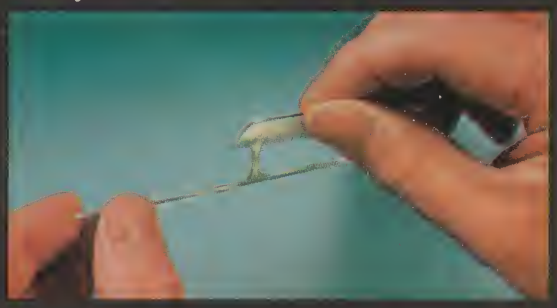
Here's why Norinyl-1 makes medical sense.

The effectiveness of Norinyl-1 as a low-dose oral contraceptive may be explained by its possible multiple action. In addition to its primary action of suppression of ovulation, Norinyl-1 may offer additional protective mechanisms... (1) creation of a cervical mucus that may be hostile to sperm penetration, and (2) development of an endometrium that may be out of phase with nidation. These effects are illustrated below.

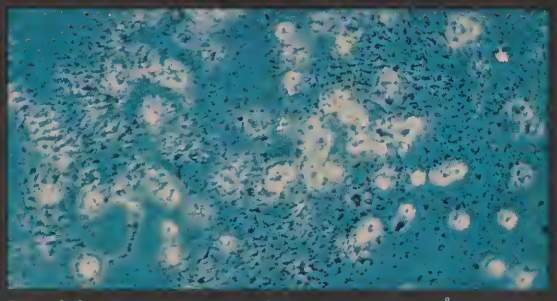


Untreated Patient

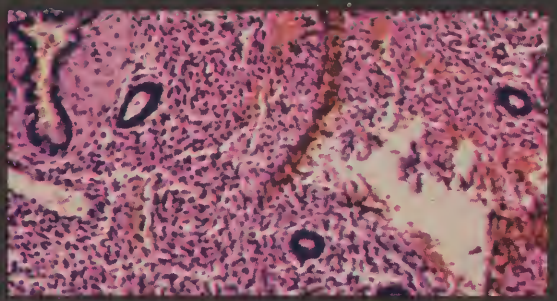
Cervical mucus at midcycle is usually thin and watery, with Spinnbarkeit (stretchability) of 15 to 20 cm.



Spermatozoa appear healthy, active, freemoving.



Endometrium of untreated patient is receptive to the fertilized ovum during secretory phase.



Norinyl-1 Patient

Cervical mucus at midcycle is scanty, viscous—with Spinnbarkeit of 1 cm. or less.

Immobile spermatozoa as they appear in cervical mucus taken from patient treated with Norinyl-1.

Norethindrone in Norinyl-1 accelerates secretory phase, suppresses glandular and vascular development.

Norinyl®-1 tablets
(norethindrone 1mg. & mestranol 0.05mg.)

- new low dose of time-proved ingredients
- established norethindrone/mestranol ratio
- lower patient cost

An uncommon steroid for common inflammatory dermatoses

In everyday topical steroid therapy, Synalar produces rapid resolution of inflammation and itching in steroid-responsive dermatoses—and at relatively low cost to the patient.

Advanced molecular design enhances potency

Synalar combines the advantage of earlier corticosteroid compounds with unique structural innovations. As a result, preparations of Synalar 0.01% and Synalar 0.025% have been reported to be more potent topically and significantly more effective than hydrocortisone 1.0%. The unique fluocinolone acetonide molecule provides one of the most useful topical corticosteroids for everyday practice.

Impressive clinical results in a wide range of dermatologic problems

The clinical efficacy of Synalar has been extensively documented in the world literature. Commonly encountered diseases such as allergic and contact dermatitis, eczematous and seborrheic dermatitis, and neurodermatitis respond rapidly to Synalar, often where previous therapy with other topical corticosteroids has failed.

Low patient cost for wider usefulness

With Synalar, a high degree of efficacy does not mean high price. And—a small quantity goes a long way. Thus, your patients can often obtain the "economy" of a hydrocortisone preparation with the proved efficacy of a potent, truly advanced steroid.

Synalar®
fluocinolone acetonide

Turn page for contraindications, precautions and side effects

For everyday topical steroid therapy

Synalar® 0.01%

fluocinolone acetonide provides economy in two practical dosage forms

For general use, the most economical and widely applicable concentration of Synalar is 0.01% Cream in a water-washable, vanishing cream base. Synalar Solution 0.01% is especially valuable in dermatoses involving moist, intertriginous areas or hairy sites where creams and ointments do not spread or penetrate readily. Synalar Solution is a unique dosage form—clear, nongreasy, cosmetically elegant.

Product Information

Contraindications: Tuberculous, fungal, and most viral lesions of the skin (including herpes simplex, vaccinia, and varicella). Not for ophthalmic use. Contraindicated in individuals with a history of hypersensitivity to any of the components. *Precautions:* Synalar preparations are virtually nonsensitizing and nonirritating. However, the solution may produce burning or stinging when applied to denuded or fissured areas. In some patients with dry lesions, the solution may increase dryness, scaling or itching. Where severe local infection or systemic infection exists, the use of systemic antibiotics should be considered, based on susceptibility testing. While topical steroids have not been reported to have an adverse effect on pregnancy, the safety of their use on pregnant females has not absolutely been established. Therefore, they should not be used extensively on pregnant patients, in large amounts, or for prolonged periods of time. *Side Effects:* Side effects are uncommon with topical corticosteroids. As with all drugs, however, a few patients may react unfavorably to Synalar under certain conditions. In such cases the agent should be discontinued and appropriate measures taken. *Availability:* Synalar (fluocinolone acetonide) Cream 0.025%—5, 15 and 60 Gm. tubes and 425 Gm. jars. Cream 0.01%—15, 45 and 60 Gm. tubes and 120 Gm. jars. Solution 0.01%—20 and 60 cc. plastic squeeze bottles. Ointment 0.025%—15 and 60 Gm. tubes. Neo-Synalar® (neomycin sulfate 0.5% [0.35% neomycin base], fluocinolone acetonide 0.025%) Cream—5, 15 and 60 Gm. tubes.

HUMAN REPRODUCTION

Indications began to appear early last year that a "second generation" of contraceptive drugs, emphasizing long-term antifertility, are on the horizon.

Significant changes in state laws concerning therapeutic abortion also were seen during the year, and these were accompanied by indications of liberalizing attitudes toward pregnancy termination for medical reasons.

The American Medical Association House of Delegates adopted a major revision of policy on therapeutic abortion, but made it clear that the AMA still opposes induced abortion, except in certain circumstances. Prepared by the AMA Committee on Human Reproduction and approved by the Board of Trustees, the policy statement is a guide for local and state medical societies in states contemplating legislative reform.

". . . Recognizing that there are many physicians who, on moral or religious grounds, oppose therapeutic abortion under any circumstances," the new policy statement says, "the American Medical Association is opposed to induced abortion except when there is documented medical evidence that":

1. continuance of the pregnancy may threaten the health or life of the mother, or
2. the infant may be born with an incapacitating physical deformity or mental deficiency, or
3. continuance of a pregnancy, resulting from legally established statutory or forcible rape or incest may constitute a threat to the mental or physical health of the patient.

Two other physicians of recognized professional competence must examine the patient and con-

cur in writing with the recommendation for therapeutic abortion, and the gynecologic procedure must be performed in a hospital accredited by the Joint Commission on Accreditation of Hospitals.

Two states, Colorado and North Carolina, enacted legislation similar to the AMA policy statement, while California incorporated in its laws a more liberal approach to abortion but did not include provisions authorizing abortion in case of suspected physical or mental damage to the unborn child.

Research on long-term contraceptive drugs was described at a meeting of Planned Parenthood Physicians in Atlanta, Ga. As reported in the Medical News section of the *Journal of the American Medical Association,* research centers upon: 1. implantable, sustained release preparations, and 2. two injectable contraceptive drugs that have proven safe and acceptable in clinical trials ranging up to three years in duration. Investigators indicated that testing of both types of drugs was continuing.

A scientific report of the World Health Organization urged intensified worldwide research to devise a test for predicting ovulation some days in advance. Lack of a simple, inexpensive—and above all, accurate—test for predicting ovulation is the major barrier to wider use of the "rhythm method," WHO said. The "rhythm method" of sexual continence during fertile periods of a woman's cycle is the only means of conception control sanctioned by the Roman Catholic Church and thus the only means that is fully acceptable to millions of couples throughout the world. The basic difficulty with current tests to identify fertile periods in the woman is that they are retrospective—that is, ovulation already has occurred when positive physiological signs appear.

THE MONTH IN WASHINGTON

The National Advisory Commission on Health Manpower reported that the nation's health care system must be improved to assure that quality health care is available to all Americans at a reasonable cost.

The 15-member Commission, in its report to President Johnson, urged a substantial expansion in the capacity of existing medical schools and continued development of new schools. At the same time, the advisory group said "although the need for more physicians is urgent, the costs and dangers of a crash effort to increase production appear to outweigh the benefits."

The Commission, headed by J. Irwin Miller, chairman of the Cummins Engine Co., Columbus, Ind., was established in May, 1966, by President Johnson to recommend bold, imaginative ways to meet health manpower needs. Five physicians signed the report, including Dwight Wilbur, MD, President-Elect of the American Medical Association.

The Commission members agreed that tackling the problem of manpower, alone, would not cure present ills.

". . . If additional personnel are employed in the present manner and within the present patterns

and systems of care, they will not avert, or even perhaps alleviate, the crisis," the Commisssion said.

"Unless we improve the system through which health care is provided, care will continue to become less satisfactory, even though there are massive increases in costs and in numbers of health personnel."

The Commission's recommendations were accompanied by an assertion that government alone is not big enough to solve the problems of health care for the American people.

The **American Medical Association's** House of Delegates at its recent meeting in Houston, Texas, approved a report of the Board of Trustees on the Commission's report. The Board stated:

"The 'Report of the National Advisory Commission on Health Manpower' reflects much of the serious attention given to the evolving needs of health care long recognized, studied and implemented by the American Medical Association and other professional groups in the health fields.

"The House of Delegates and the Board of Trustees of the AMA have not had time to study the Report carefully. . . . However, it appears to recognize the needs arising from the rapid growth of the public's desire for health care. This attitude is the result of increasing awareness of the great advances in medical science and techniques, and of the prolongation of life for millions into middle and advanced ages. . . .

"The Report will receive the intensive study of the various expert groups within AMA and reports on their recommendations will be issued as soon as they can be developed properly. There appear to be some areas in which modifications will be necessary to assure attaining the objectives sought for advancement of health care for all citizens."

The Commission's proposals included:

1. Federal funds in support of capital or operating costs of education should be provided to a medical school in such a way that they create economic incentives for the school to expand enrollment while improving its quality.

2. The federal government should make available to any medical student loans to cover the full costs of tuition and living expenses during formal professional education. The student should be able to choose between repaying the loan from earnings over a period of years or giving two years of his time to approved national service apart from Selective Service obligations.

In discussing these two recommendations, Dr. Wilbur said, "I believe that principle is not sound and that the recommendations are impractical, unnecessary, will not serve the purposes intended, and will be largely unacceptable to most students."

3. The federal government should give high priority to the support under university direction of experimental programs which train and utilize new categories of health professionals.

4. At a minimum, foreign-trained physicians who will have responsibility for patient care should pass tests equivalent to those for graduates of U. S. medical schools.

5. The Selective Service Act should be amended to provide for the automatic transfer of the records of every draft-eligible health professional, upon his graduation from professional school, from the local board of his original registration to the local board in whose jurisdiction he works and for subsequent transfer with each change in the location of his work.

6. The Selective Service Act should be amended to provide equal draft-liability for U.S. and foreign medical graduates.

7. Service with the U.S. Public Health Service should be phased out as a substitute for the military obligation of health professionals.

8. The Department of Defense should be instructed to encourage the greater use of the Military Medicare Amendments of 1965 and should study the feasibility of utilizing voluntarily obtained health professionals in military facilities located in the United States.

9. Nursing should be made a more attractive profession by such measures as appropriate utilization of nursing skills, increased levels of professional responsibilities, improved salaries, more flexible hours for married women, and better retirement provisions.

10. Programs for health care of the disadvantaged should be given highest priority and made available wherever needed.

11. Professional societies, universities, and state governments should undertake, with federal support, studies on the development of guidelines for state licensure codes for health personnel.

12. Professional societies and state governments should explore the possibility of periodic re-licensing of physicians and other health professionals.

13. Professional societies, health insurance organizations, and government should extend the development and effective use of a variety of peer review procedures in maintaining high quality health and medical care.

* * * * *

President Johnson signed a $281 million mental retardation bill with a statement that the nation still is not doing enough to solve the problem.

He said that in dealing with the problem of mental retardation it was clearly the obligation of the nation to act.

"We are not doing enough, we must do more, we are going to do more," Johnson said.

The bill strengthens federal aid for the construction of new facilities for the mentally retarded.

He also signed a three-year, $589 million extensions of federal aid for state public health programs.

It provides for federal licensing of clinical laboratories operating in interstate commerce unless they are run by pathologists, in which case the facilities would have to meet standards set by the American College of Pathologists or the American Hospital Association. Individual physicians operating labs for their own patients would not be affected by the new law.

Let's be specific about Campbell's Soups... and *reducing diets*

There are more than 30 million people in America who are overweight. During the next year, you probably will see more than 1,000 of them in your own practice.

One good way to help these patients is to give them a reducing diet based on ordinary eating patterns.

Campbell has prepared a sensible plan for weight control based on ordinary eating patterns. The plan consists of a patient instruction booklet and a set of menus which provide approximately 1,200 calories daily. The menus are balanced to provide the minimum daily requirements of nutrients.

To obtain a supply for your office write to:
Campbell Soup Company, Box 265, Camden, N. J. 08101

LOMOTIL®

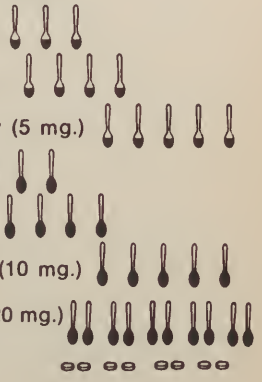
TABLETS / LIQUID

Each tablet and each 5 cc. of liquid contains:
diphenoxylate hydrochloride . . . . . .2.5 mg.
(Warning: may be habit forming)
atropine sulfate . . . . . .0.025 mg.

Halts Diarrhea Promptly

in children with . . . Gastroenteritis ▪ Spastic bowel
Influenza-like infections ▪ Antibiotic-induced diarrhea

Lomotil helps get children with diarrhea off toast and tea and back to normal diets and normal activity with gratifying dispatch. ▪ Lomotil lowers intestinal motility and permits absorption of excess fluid. This usually controls diarrhea promptly. ▪ Moreover, lowered intestinal motility achieved with Lomotil often relieves the abdominal cramps and discomfort so distressing to children.



Precautions: Lomotil is a Federally exempt narcotic preparation of very low addictive potential. Recommended dosages should not be exceeded, and medication should be kept out of reach of children. Should accidental overdosage occur signs may include severe respiratory depression, flushing, lethargy or coma, hypotonic reflexes, nystagmus, pinpoint pupils, tachycardia; continuous observation is recommended. Lomotil should be used with caution in patients with impaired liver function or those taking addicting drugs or barbiturates.

Side Effects: Side effects are relatively uncommon but among those reported are gastrointestinal irritation, sedation, dizziness, cutaneous manifestations, restlessness, insomnia, numbness of the extremities, headache, blurring of vision, swelling of the gums, euphoria, depression and general malaise.

Dosage: The recommended initial daily dosages, given in divided doses until diarrhea is controlled, are:

Children: Total Daily Dosage

3-6 mo. . .½ tsp.* t.i.d. (3 mg.)
6-12 mo. .½ tsp. q.i.d. (4 mg.)
1-2 yr. . . .½ tsp. 5 times daily (5 mg.)
2-5 yr. . . .1 tsp. t.i.d. (6 mg.)
5-8 yr. . . .1 tsp. q.i.d. (8 mg.)
8-12 yr. . .1 tsp. 5 times daily (10 mg.)
Adults: . .2 tsp. 5 times daily (20 mg.)
or 2 tablets q.i.d.

*Based on 4 cc. per teaspoonful.

Maintenance dosage may be as low as one-fourth the initial daily dosage.

SEARLE *Research in the Service of Medicine*

He's on the wagon...an

How well does Vistaril relieve the symptoms that plague an alcoholic during the recovery period? Doctors Knott and Beard of the Alcoholic Rehabilitation Unit, Tennessee Psychiatric Hospital and Institute, recently conducted a double-blind study comparing Vistaril and another well-stablished antianxiety agent with placebo in 60 hronic alcoholic patients.[1]

The investigators conclude: "It was the opinion f the staff that hydroxyzine was generally more ffective than chlordiazepoxide, for the follow-ng reasons: hydroxyzine was equally if not more ffective in reducing anxiety and tension and it roduced less daytime sedation...."[1] (See results n succeeding pages.)

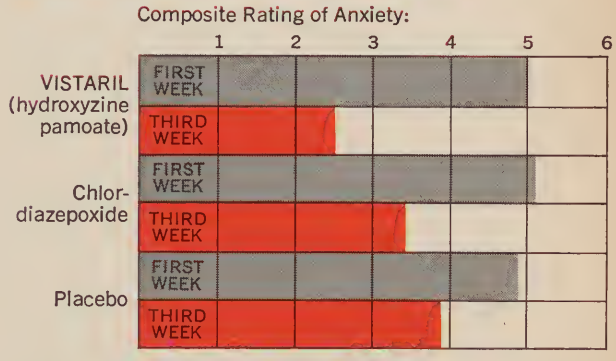
ere is new evidence that Vistaril can ease ten-on, allay anxiety in chronic, hospitalized alco-olic patients. *But you might also choose Vistaril r what it doesn't do.* Although not evaluated in is study, Vistaril is reported to be non-euphor-nt, and its low toxicity makes it relatively safe. est of all, Vistaril is non-habituating. To date, ter more than ten years of clinical use, there ve been no reports of dependency in patients ceiving Vistaril.

ith Vistaril, it is as easy to op therapy as it is to start.

Vistaril®
(HYDROXYZINE PAMOATE)

the study:[1] Sixty chronic alcoholic patients were hospitalized and randomly assigned to one of three oral double-blind treatment regimens for three weeks. Twenty patients received hydroxyzine (Vistaril®), 100 mg. q.i.d.; twenty others were given chlordiazepoxide, 25 mg. q.i.d.; and the remaining twenty received placebo capsules q.i.d. The capsule code was not made known until after completion of the study and analysis of the data. Response was measured with a modification of the Brief Psychiatric Rating Scale as originally outlined by Overall and Gorham.* Subjects were rated daily by trained staff members.

SYMPTOM RATING KEY



1=Not Present	4=Moderately Severe
2=Mild	5=Severe
3=Moderate	6=Extremely Severe

The figures which are given below represent the composite conclusions of the staff based on daily ratings during initial and final weeks of the study.

*Psychological Reports 10:799, 1962

ooperativeness not a significant problem

In Alcoholism...

Vistaril®

(HYDROXYZINE PAMOATE)

BRIEF SUMMARY

Contraindications: Hypersensitivity to hydroxyzine. The parenteral solution, for intramuscular or intravenous use, *must not* be injected subcutaneously or intra-arterially.

Hydroxyzine, when administered to the pregnant mouse, rat, and rabbit induced fetal abnormalities in the rat at doses substantially above the human therapeutic range. Clinical data in human beings are inadequate. Until adequate data are available to establish safety in early pregnancy, hydroxyzine is contraindicated during this period.

Precautions: Hydroxyzine may potentiate the action of central nervous system depressants such as narcotics and barbiturates. In conjunctive use, dosage for these drugs should be decreased, as much as 50%. Because drowsiness may occur, patients should be cautioned against driving a car or operating dangerous machinery. The usual precautions for intramuscular injection should be followed; soft-tissue reactions have rarely been reported when proper technique has been used. Hydroxyzine parenteral solution for intramuscular use should be injected well within the body of a relatively large muscle. In adults, the preferred sites are the upper outer quadrant of the buttock (i.e., gluteus maximus), or the mid-lateral thigh. In children, preferably the mid-lateral muscle of the thigh. In infants and small children the upper outer quadrant of the gluteal region should only be used when necessary, as in burn patients, in order to minimize the possibility of damage to the sciatic nerve. The deltoid area should be used only if well developed, such as in certain adults and older children, and only with caution to avoid radial nerve injury. Injections should not be made in the lower and middle thirds of the upper arm. Aspiration should be done to help avoid intravascular injection. On reported intravenous injection a few instances of digital gangrene have occurred distal to the injection site, considered to be due to inadvertent intra-arterial injection or possibly periarterial extravasation. Therefore, particular caution (aspiration and site injection) should be observed to insure injection only into intact veins; avoid either intra-arterial injection or extravasation. Intravenous administration should be accomplished slowly, no faster than 25 mg. per minute, and not to exceed 100 mg. in any single dose. In order to avoid possible adverse effects it is recommended that hydroxyzine parenteral solution be diluted to at least 50 cc. with sterile normal saline and administered over a period of four minutes or more, preferably into the tubing of a running intravenous infusion.

Adverse Reactions: Drowsiness may occur; if so, it is usually transitory and may disappear in a few days of continued therapy or upon dosage reduction. Dryness of the mouth may occur with higher doses. Involuntary motor activity, including rare instances of tremor and convulsions, has been reported, usually with higher than recommended dosage.

When this product is given intravenously undiluted, minimal amounts of intravascular hemolysis occur at the site of injection. Giving the maximum recommended intravenous dose (100 mg.) to adults results in immediate transient hemolysis with the liberation of a total of 2-3 grams of hemoglobin, which, in some individuals, can cause small amounts of hemoglobinuria. This compares with the normal red cell destruction from which approximately 8 Gm. of hemoglobin are liberated every 24 hours. If the hydroxyzine is diluted with 50 cc. of normal saline and given during a period of four minutes or more, this phenomenon does not occur.

Supply: Vistaril (hydroxyzine pamoate) Capsules: Equivalent to 25 mg., 50 mg., 100 mg. hydroxyzine HCl. Vistaril (hydroxyzine pamoate) Oral Suspension: Equivalent to 25 mg. hydroxyzine HCl per 5 cc. teaspoonful. Vistaril (hydroxyzine HCl) Parenteral Solution: 25 mg./cc.—10 cc. vial and 50 mg./cc.—2 cc. and 10 cc. vial; Isoject,® 25 and 50 mg. per cc., 1 cc. per unit.

Photo professionally posed.

No injection after all!

This penicillin produces high, fast levels—orally.

Pen•Vee® K is usually so rapidly and completely absorbed that therapeutic penicillin levels are attained within 15 to 30 minutes. Thus it can often obviate the need for penicillin injections. The higher serum levels produced generally last longer than with those of oral penicillin G.

Indications: Infections susceptible to oral penicillin G: propnylaxis and treatment of streptococcal infections; treatment of pneumococcal, gonococcal, and susceptible staphylococcal infections; prophylaxis of rheumatic fever in patients with a previous history of the disease.
Contraindications: Infections caused by nonsusceptible organisms; history of penicillin sensitivity.
Warnings: Acute anaphylaxis (may prove fatal unless promptly controlled) is rare but more frequent in patients with previous penicillin sensitivity, bronchial asthma or other allergies. Resuscitative (epinephrine, aminophylline, pressor amines) and supportive (antihistamines, methylprednisolone sodium succinate) drugs should be readily available. Other rare hypersensitivity reactions include nephropathy, hemolytic anemia, leucopenia and thrombocytopenia. In suspected hypersensitivity, evaluation of renal and hematopoietic systems is recommended.
Precautions: In suspected staphylococcal infections, perform proper laboratory studies including sensitivity tests. If overgrowth of nonsusceptible organisms occurs (constant observation is essential), discontinue penicillin and take appropriate measures. Whenever allergic reactions occur, withdraw penicillin unless condition being treated is considered life threatening and amenable only to penicillin. Penicillin may delay or prevent appearance of primary syphilitic lesions. Gonorrhea patients suspected of concurrent syphilis should be tested serologically for at least 3 months. When lesions of primary syphilis are suspected, dark-field examination should precede use of penicillin. Treat beta-hemolytic streptococcal infections with full therapeutic dosage for at least 10 days to prevent rheumatic fever or glomerulonephritis. In staphylococcal infections, perform surgery as indicated.
Adverse Reactions: (Penicillin has significant index of sensitization): Skin rashes, ranging from maculopapular eruptions to exfoliative dermatitis; urticaria; serum sickness-like reactions, including chills, fever, edema, arthralgia and prostration. Severe and often fatal anaphylaxis has been reported (see "Warnings").
Composition: Tablets—125 mg. (200,000 units), 250 mg. (400,000 units), 500 mg. (800,000 units); Liquid—125 mg. (200,000 units) and 250 mg. (400,000 units) per 5 cc.

GUIDELINES LAID DOWN

Another milestone was recorded at the Faculty's semiannual session when the House of Delegates unanimously adopted a Physician/Pharmacist Code of Cooperation that has since been adopted by the Maryland Pharmaceutical Society.

Guidelines for physicians and attorneys had already been established by the 1964 Code of Cooperation between the Medical and Legal professions that provided a sounding board for misunderstandings and clarifications in problem areas.

While there is probably less of a gulf between the physician and the pharmacist than between the physician and the attorney, the success of the earlier code adopted by the House of Delegates provided a basis for the new code between the related professions. The main point established being the differences in the philosophy of the two professions.

In the code, physicians agree to give patients a free choice of pharmacy and in turn, pharmacists are responsible for carrying a complete line of pharmaceutical products to fill all prescriptions even though a drug may be considered somewhat esoteric and is, perhaps, rarely prescribed.

Also fully discussed and firmly established is a code concerning "kickbacks," "rebates" and "fee splitting." And although physicians and pharmacists recognize these as illegal procedures, misunderstandings have arisen in regard to the fine points of the problem.

Simultaneously with the House of Delegates meeting, the Council adopted a provision that Rx blanks should not contain imprinted codes indicating the number of refills for a prescription. This decision was reached based on the practice of the patient changing the physician's directions therefore resulting in abuse of the prescribed drug. It is hoped that this provision will lead to a reduction of any abuse that might take place.

But the main purpose in establishing the Physician/Pharmacist Code of Cooperation is to furnish firm guidelines for the newly-licensed physician and pharmacist, as well as to delineate the standards which physicians and pharmacists have practiced for years.

CRYOSURGERY AND ITS APPLICATION TO EAR, NOSE AND THROAT SURGERY

CHARLES L. HILL, MD
Providence, Rhode Island

Cryosurgery is basically a therapeutic technic which relies upon tissue necrosis in response to lowering of temperature. This basically is dependent upon devascularization of tissue and permeability of cells to water. It is not really a new find—it has been used for hundreds of years. Initially, cold, in the form of ice in brine solution, was used by the ancients to slow metabolism in treatment of anything from infection to cancerous tissue and apparently this worked for awhile. We are more familiar with the dermatological use of cold, using dry ice on warts and other skin lesions.

The controlled use of cold started with Irving Cooper, MD, in New York four or five years ago when he, in conjunction with the Union Carbide Corporation, developed a machine using a circulating liquid refrigerant. This was liquid nitrogen which would produce temperatures in the area of 196° below Centigrade. The equipment was relatively accurate, and could maintain this temperature for a relatively long time—as long as the nitrogen stayed in reserve. They were able to develop an applicator which could be varied in size making the usefulness of this more widespread in the treatment of different size lesions.

The other refrigerant used was Freon. This does not get as cold and reaches about 80° below Centigrade.

The basic structure of the equipment that is used now is a tube within a tube within a tube. If you can picture the sleeve interrelationship of these conduits, the inside tube supplies the liquid to the tip which is generally a hollow applicator, varying in size and shape, depending again on the area of tissue and the particular location you want to freeze. When this liquid enters the tip, it becomes vaporized, and turns into a gas, which then is exhausted through the second tube, and is either expelled through the handle or through the back of the machine.

The third tube acts as an insulating device, and some of the equipment acts as a vacuum or is just an air-containing sleeve. On the newer equipment there is some kind of defrosting device on the tip, so you don't have to wait for the body to defrost the tissue to allow you to take away the probe from the area which you are freezing. The area exposed to the cold, the tip temperature and the time of exposure determine the amount of necrosis of the tissue with which you are concerned.

Cause of Injury and Death in Frozen Cells

The pathophysiological cause of injury in the frozen cells is basically three-fold. The first is thermal shock.

This occurs through the rapid cooling which appears to affect the permeability of the cells in both the water and the electrolytes. This is not a major factor in cell death. Dehydration and solute concentration is more prominent because of necrosis with extracellular freezing. There is an

Given before the Maryland ENT Society Nov. 8, 1966, at 8 P.M. in the Jubilee Room of the Sheraton-Belvedere Hotel, Baltimore, Md.

increase in the solute concentration. As freezing progresses, the solutes precipitate, and eventually all the water will freeze. This is called the eutectic point. It is actually the increase in solute concentration which affects the molecular structure of the enzymes and cell membranes. This is apparently where a great deal of the necrotic effect of cold lies.

The third important cause of death is injury from ice formation itself. Intracellular freezing as opposed to extracellular freezing depends upon the rapidity of cooling. The faster the cell is cooled, the larger the ice crystals formed within the cell. It is these larger ice crystals that appear to be more lethal. The amount of information that we have as to what causes the death of the cells is not very great at this time. There is a tremendous amount of basic research going on to determine just how cold the tissue should be and just how long you should freeze to actually get necrosis. In conjunction with this there is an optimum freezing necessary to obtain necrosis of different cells depending on permeability of the cell membranes, and what is extremely important now appears to be the time of thaw. Here again this is something we don't know very much about. We don't really know the basic causes of its action.

The anesthesia involved is a matter of preference. The cold itself has an effect on the nerves in that it will initially provide a burning sensation that lasts for about 30 seconds. When the burning sensation disappears you have a relative ice anesthesia.

Dr. Hill's Study of Tonsils

In an effort to find a treatment for carcinoma of the nasopharynx, Dr. Cooper's work was thought to have some application to the problem. We thought the best way to study the effects would be to study tonsils. It turned out that actually the process had more application to the tonsils than it did to carcinoma of the nasopharynx.

In starting the anesthesia with the tonsil in the patient—initially this work was done with dogs, then we had volunteers—we sprayed the throat with some topical anesthetic, and then one tonsil was infiltrated with Xylocaine (*lidocaine*) or Novocaine (*procaine*). The discomfort associated with a topically anesthetized tonsil was about as uncomfortable as the needle.

Other Uses of the Cooper Probe

The same process can be used anywhere in the body. There is some discomfort for 30 seconds after the thaw starts. This can be relatively severe, but apparently as long as the patients are warned about this, it doesn't bother them too much.

The time of application of the cold probe is something that varies with the tissue, the type of tissue, the mass of tissue to be destroyed, and the vascularization of the particular tissue. There appears to be no definite time sequence as yet. Visually you can see how long or how wide your zone of freezing is, and this helps to determine how long you can freeze the area.

Basically the method is freezing the tissue until the frost line extends to what you consider to be normal tissue—you can see this white extension going into the normal tissue. Then you can stop and thaw. There is an area of reversibility.

This is most dramatically illustrated by Dr. Cooper's use of this. He will take an individual with Parkinson's disease who has a severe tremor. (He does the procedure under local anesthesia, so he is doing a neurological examination on the patient all the time.) The patient will have a hand that is just quivering and cannot really move the fingers. He will try to get them together. He will put the probe in, start to freeze, and slowly you will see the hand start to relax, and the quivering will stop, and suddenly the patient can just take his fingers and put them together. It is an extremely dramatic thing to see. But he is doing other neurological examinations as he does this.

If he starts to get some sensory change he will stop in the knowledge that although the cold has affected these cells, when it thaws the reversibility will be present so he does not really have necrosis. He only destroys necessary tissue.

This is true no matter what you are freezing. It can be frustrating, because you think you have destroyed something but in fact when it thaws it will return to normal. Because of this it appears now that at least a two-cycle freezing time is necessary.

Most of the work that has been done has been related to just one time of freezing, whether it be 2 minutes or 5 minutes or 8 minutes or 10 minutes. The tissue has been frozen for that length of time, and then it has been allowed to thaw. You wait two or three weeks to see what happens.

Wm. George Cahan, MD, at Memorial Hospital in New York, has been using a double freezing technic right from the start. We had been a little worried about this because some of the pathological slides that we looked at showed signs there was cell change that suggested this might be a carcinogenic agent. The slide taken from tissue which had been frozen only once was all right. It didn't have the chromosomal changes.

So what we did was to take tonsils and freeze them, let them thaw over 3 or 4 minutes, refreeze them, take biopsies of the tonsil, examine them under the microscope, and also plant them in tissue culture. Our genetics chief, Paul LaMarche, MD, looked at several of these tissue cultures and then examined the cells that were growing under the microscope, made solutions from the cells which were injected back into the patient in several different sites, and then looked to see if we were getting any kind of sarcomatous growth. Fortunately there was no problem whatsoever.

We also took serum solution for antibody formation, looking a little bit further ahead, to see if we were perhaps stimulating antibody formation. This might have some application towards cancer control. There is a lot of work going on in this area.

It takes about 8 minutes to freeze a 2 cm ball of tissue, no matter what this tissue is—liver or tonsil or muscle (except bone)—at a temperature of below 80° Centigrade. It does not seem to make any difference whether it is 190° below Centigrade, it still takes about 8 minutes.

The material we used has been predominantly tonsil tissue in adults. We don't think this has an application to children, because there is a certain amount of discomfort associated with it, requiring a general anesthetic. If a child should jump and the probe is torn away from the tonsil, you will get avulsion of the tissue and bleeding, much as when one's tongue is burned on an ice tray. Once you have the child asleep, you might as well go ahead and do the tried and true procedure. This is no better, and I don't think it is really as good as the routine tonsillectomy.

Ninety patients have been done with a single cycle of freezing each tonsil for between 3 and 6 minutes, depending on the size of the tonsil. Three of these people continued to have symptoms after the freezing. They did well for a month or six weeks, but then they would start to have tonsillitis, and we would have cultured Strep infections. We surgically removed these tonsils both because we wanted to get the patient better, and we were also interested in the pathological examination of the tissue. What this tissue showed was areas of scarring and normal germinal follicles. The operation was perhaps a bit more difficult than it would otherwise have been because of the scarring, but in these patients we could have gone back and refrozen the area if we had wanted to.

An interesting factor is the amount of destruction of the tonsil tissue varied between 90% and 20%. In some of these patients, when examined three to four weeks or even a month later it would seem nothing had been done as far as destruction of tissue is concerned, and yet we have patients who three years after freezing have absolutely no symptoms. These are patients we would have expected to have three or four bacterial infections a year.

Double Freeze Technic

It has just been within the last five or six months we have been doing a double freeze technic on 20 patients. Destruction is much greater, between 70 and 90%. This basically is in using the applicator whether it is the Freon machine, or the Cooper treatment with nitrogen. Freezing time is about 5 minutes on one tonsil. You freeze the other tonsil; while you are freezing that, the first one will thaw. Then you go back to the first one and freeze that again for 4 minutes.

There is the initial burning and discomfort that has been mentioned earlier and there is a moderate amount of edema. If you look in the mouth you will see some edema of the uvula and the soft palate. This seems to bother the patient for about 12 hours. Then anywhere from 12 to 24 hours he will start to have significant sore painful throat. We have taken several patients and frozen one tonsil, then removed the other surgically under local anesthesia, and some under general anesthesia, and all of the patients have agreed the discomfort from freezing is about half that which accompanies surgical removal.

About the third day the patient will start to notice a white necrotic area starting where the probe was applied and extending over most of the tonsil tissue. Basically this is frostbite that we have created and necrosis of the tissue will start. The patients then gargle with saline and there has

never been any problem with significant chunks of tissue being aspirated or causing any particular complication. This usually progresses anywhere from 7 to 14 days. Then the fossa epithelizes over, and you may either have a typical surgical fossa or the mucosa will be intact and the patient's discomfort will clear.

Of the 120 patients that we have done specifically at the hospital, we have had two episodes of bleeding. One could be classified as hemorrhage. This was at about the 10th day. It was relatively easy to handle. The other was blood in the sputum which the patient reported when she came in for a routine visit.

At the Academy meeting in Chicago one Doctor in Ohio reported three cases of bleeding. One of these required cauterization.

We have used the freezing process in treating carcinoma. The only real cure we have was of epidermoid carcinoma on the floor of the mouth of a 90-year-old man. We froze him with local anesthesia, and he is now two years post-freeze with no evidence of recurrence. He had a tumor involving both submaxillary ducts, but no swelling of the glands. He never had any pain associated with stenosis following freezing.

Also, we have used the process in palliation. In patients with carcinoma of the larynx, where the hypopharynx is completely obstructed requiring gastrostomies or tracheotomies, we have placed the *Cooper probe* in the middle of the tissue to freeze it. Visually we got an ice ball involving the tumor, resulting in a remarkable amount of pain relief. Several of the patients opened up to the extent they could take liquid diets.

There are other areas of the country where actual cancer therapy is being attempted using cryotherapy. It is useful in certain instances, but in no way should it be construed to be something that is going to supplant surgery or X-ray or a combination of the two.

An application of this is as a hemostatic agent. One patient in particular, a dental patient, had an extraction and it turned out he had a type of clotting abnormality. He bled profusely from the tooth socket even though it had been packed and sutured, and required transfusions amounting to 32 units. We inserted the *Cooper probe* in his tooth socket and in two minutes the socket stopped bleeding permanently.

In cases of spot bleeding for epistaxis this treatment has proved successful. We have a unit in the office with different types of probes we can use. Particularly exciting is the use of the probe in spot bleeding of telangiectasis. We freeze the spot for 2 minutes, and it will stop bleeding for several months. It is not a permanent cure, but it is a lot better than anything we have been able to do before.

Along this same line I want to mention the cryosurgical equipment initially used for the treatment of gastric ulcer which C. D. Bluestone, MD, in Pittsburgh, adapted to the treatment of epistaxis. When we started we would place an ordinary child's balloon in the nose and hook it up to the gastric cooling unit and circulate alcohol in the balloon for about an hour. Dr. Bluestone has brought this timing down to about 6 minutes. This has dramatic results, patients stop bleeding almost immediately. The balloon is left in the nose and usually the catheters leading into the ballon are clamped, leaving it inflated overnight. Perhaps it it is just the pressure of the liquid-filled balloon which accounts for this method's success, however, we have used other things with nowhere near the success.

Our residents were freezing a man with hemorrhagic telangiectasis, who looked as if he had a faucet in his nose when he started to bleed. His nose was frozen six months ago and for the first time in thirty years he had gone six months with absolutely no bleeding at all. He came back in with extensive bleeding and required four or five units of blood. He was refrozen, and the bleeding stopped.

Also, cryotherapy has been effective in treatment of polyps in the nose. Hans V. von Leden, MD, in California, has reported taking the probe, inserting it in the nose with no anesthesia, freezing, and removing the polyp.

Other doctors are using it for hypophysectomy going through the septum and inserting the probe up through the spur into the hypophysis. Here again they are very aware of reversibility. If they start to observe visual symptoms, they stop. They know they are going to have reversibility.

This is not a panacea. The treatment is applicable where tissue necrosis is desired. Basically, the method has its advantages over cautery and produces the same result. The procedure is relatively painless to the patient, and much more pleasant for the physician than cautery.

Lewis H. Steiner, MD
May 4, 1827-Feb. 18, 1892

With the death of Amy L. Steiner on November 17th, 1966, the Faculty Library received the principal of a trust established by Walter Ralph Steiner, MD, at the time of his death in 1942. The trust was to be known as the Lewis Henry Steiner Fund in memory of his father, also a physician, who transferred his allegiance to library work and served as the first librarian for the Enoch Pratt Free Library.

THE STEINER INHERITANCE

The roots of the Steiner family in America stem from the earliest years of this country. Of German descent, the first immigrant was Jacob Steiner who settled in Frederick County prior to 1736. On the distaff side, the ancestry is traced through Rebecca Weltzheimer Steiner who was also a native of Frederick, Md.

Lewis Henry Steiner was born in Frederick on May 4, 1827. He attended the Frederick Academy, Marshall College in Mercersburg, Pa., graduating in 1846 with an AB degree. After graduation he began the study of medicine under the preceptorship of William Tyler, MD, of Frederick. He then attended the University of Pennsylvania Medical School where he received his MD degree in 1849. He practiced a short time in Frederick then moved to Baltimore in 1852 to begin the teaching of medicine in a private medical institute owned and operated by R. J. W. Dunbar, MD. Deciding to give up the teaching of medical science, he transferred his attentions to the teaching of natural sciences in 1855.

In 1856, Dr. Steiner became active in the reorganization of the Maryland College of Pharmacy of which he held the Chair of Chemistry until 1861. He did not neglect his early training, however, for he was an active member of the Medical and Chirurgical Faculty of Maryland from 1853 until his death, as well as being actively interested in the American Medical Association.

He was active also in other scientific groups such as the American Association for the Advancement of Science, the American Public Health Association of which he served as a vice-president; and many others. When the Civil War broke out, Dr. Steiner elected to enter the service of the U. S. Sanitary Commission and in 1861 he was appointed Inspector and in 1863 Chief Inspector with the Army of the Potomac during the campaigns of 1863 and 1864. His experiences are told in two reports issued in 1862 and 1863, and in a brief history of the Sanitary Commission published in 1866. These marked the beginning of a prolific writing career for Dr.

Steiner in all of his chosen fields on subjects of particular interest to him. After the close of the Civil War in 1865, he returned to Frederick where he served as President of the Frederick County School Board. In this capacity he became particularly interested in providing school facilities for Negro children.

On October 3, 1866, he married Miss Sarah Spencer Smyth, daughter of the Hon. R. D. Smyth, of Guilford, Conn. Of their five children, three were daughters, Gertrude, Bertha and Amy; and two were sons, Bernard, who became the second librarian at the Pratt library, and Walter Ralph, who shared his father's medical interests. From 1856 to 1861 Dr. Steiner served as assistant editor of the American Medical Monthly of New York. He contributed frequently to the Southern Quarterly and the Mercersburg Quarterly Review. He presented countless scientific papers at various learned societies. He was honored by the College of St. James in 1854 with the degree of AM (Honoris Causa); and by Yale University in 1869 with the same degree. In 1884, Delaware College conferred upon him an LLD degree and three years later, Franklin and Marshall College honored him with a LittD degree.

Dr. Steiner was selected in 1884 by the Trustees of the Enoch Pratt Free Library to serve as first librarian. He devoted his tremendous talents and energies to the establishment of the firm base upon which the Pratt stands today. During the first eight years of the library's development, he worked closely with Enoch Pratt. They were close personal friends and their two families were intimately associated.

He died in 1892 and his son, Bernard, was chosen as his successor.

Walter Ralph Steiner

Walter Ralph Steiner, familiarly known to his friends and classmates as "Bob" or "Dutch" was born on November 18, 1870, in Frederick County.

He received his early schooling at the Frederick Academy and University School of Baltimore. He graduated with a BA degree in 1892, from Yale; and received an MD degree from The Johns Hopkins School of Medicine in 1898. He was closely associated with Osler, Halsted and Kelly and worked with them until 1900 when he moved to Hartford, Conn. to enter the private practice of medicine.

Walter R. Steiner, MD
Nov. 18, 1870-Nov. 4, 1942

Because of the intense interest in the Faculty's library demonstrated by his father, who served on the Library Committee and was instrumental in organizing and maintaining interest in the early days of the medical library; and because of Sir William Osler's close connection with the Faculty and its library, Dr. Steiner was effective in building up the library of the Hartford Medical Society so that it eventually became the best medical library in any city of the nation the size of Hartford.

He did not devote his attention to collections of medical books only, however. At the time of his death in 1942 he bequeathed his rare and extraordinary collection of books on Nathan Hale to the State of Connecticut. Dr. Steiner left his collections on Hawaii, John Paul Jones, and the prison camps of the Civil War to the Library of Congress. His rare medical books were willed to the Faculty with the provision that any duplicates be turned over to the Johns Hopkins Medical Library. Dr. Steiner's own literary contributions to medical and other journals are innumerable.

METASTASIS AND DEVELOPMENT OF MALIGNANCY IN BENIGN COLONIC POLYPS

Do benign adenomatous polyps of the colon become malignant or are malignant polyps cancer from the beginning? This is a subject that has found divergent support in the literature from equally qualified surgeons.

JOHN W. BERGHUIS, MD
Adrian, Michigan

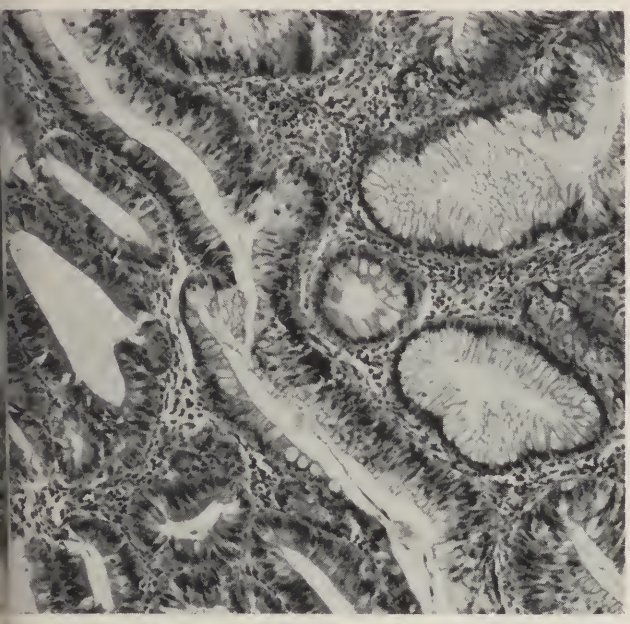
Classification of Polyps

According to Welch[1] a good deal of confusion is due to the fact that many institutions have revised their classification of polyps. For instance, 10 to 12 years ago 8% of the colon adenomas at Massachusetts General Hospital were of the villous type. Whereas in the past few years the villous type comprised 28% of all adenomas at the same institution. Twenty or more years ago it was widely held that all adenomas would eventually degenerate into cancer, should the patient live long enough. Sunderland and Binkley[2] have done much work in the differentiation of villous adenomas and simple adenomas. This separation made it apparent that the villous adenoma accounted for much of the "cancer in polyps" that had been reported previously.

Spratt, Ackerman and Moyer[3] feel that simple adenomas very rarely, if ever, develop into cancer. They state that they have never found a case of metastatic carcinoma that originated in a carcinomatous colonic polyp in which the stalk did not contain neoplastic cells.

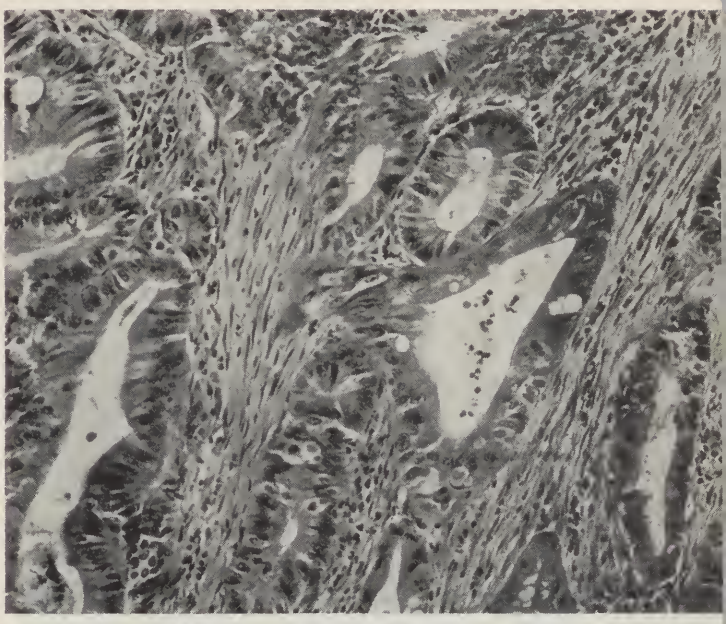
Knoernschild[4] studied 257 patients with asymptomatic benign polyps. Of this group 213 were followed for a period of 3 to 5 years. During that time 70% of the polyps remained the same size. However in 4%, the polyp increased significantly in size, while in 18% it had disappeared entirely. Two adenomas did change in appearance and were proved by biopsy to have developed into cancer.

Welch[1] believes that most simple adenomas remain benign during the life of the host. On the other hand, he believes carcinoma develops much more commonly in simple adenomas than in the normal mucosa of the colon and rectum. He reasons if one compares the number of mucosal cells in an adenoma with the number in a host's intestine and assumes the cancer potential per cell to be the same, then one should see many more cancers arising in the colon as compared to an adenoma. This is not the case, for many more cancers are found in adenomatous polyps, in relation to the number of cells present, than *denovo* from normal mucosa. Following is a case which lends support to the theory that benign colonic polyps do become malignant and indeed metastasize.



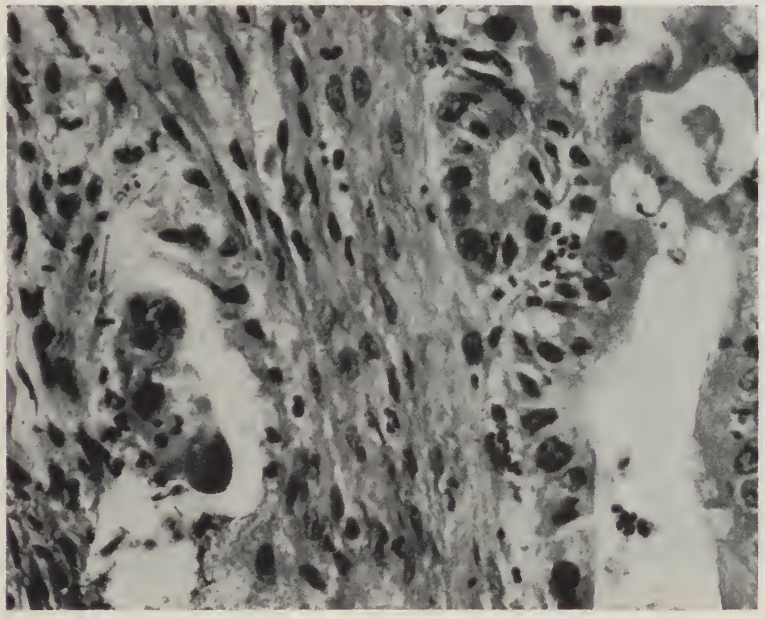
Case Summary

M. L. is a 40-year-old woman who has been in excellent health. She first noted bloody mucous in her stools in mid-December 1966. Barium enema



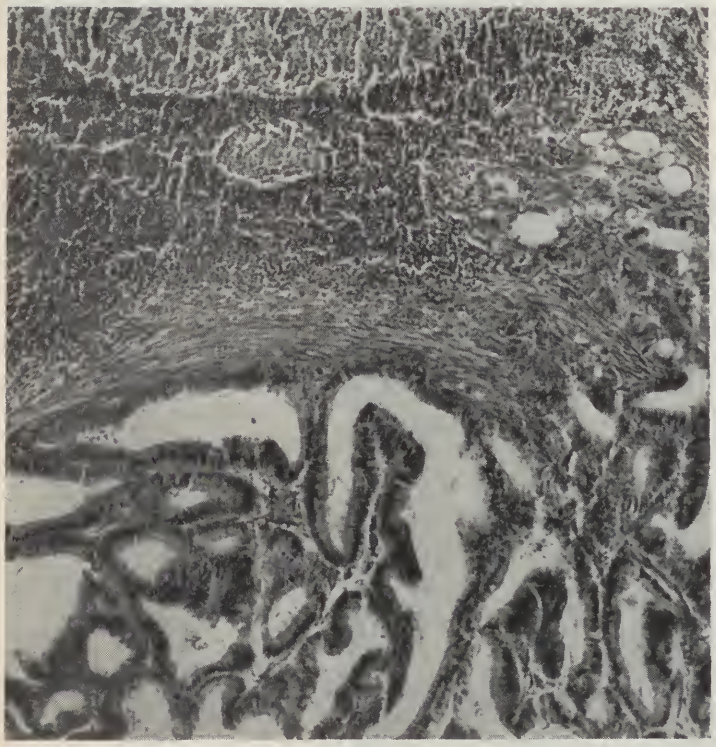
examination of the colon revealed a radiolucent defect in the sigmoid colon. Re-examination of the colon in January failed to demonstrate the filling defect.

Although the history was quite typical of a colonic polyp, with recurrent periodic passage of bloody mucous and blood-streaked stools, a repeat of the colon examination was delayed for personal reasons. Repeat examination of the colon on April 21, 1967 again demonstrated a polyp in the mid-sigmoid colon.



On April 27, 1967 laparotomy and sigmoid polypectomy was performed. The polyp was situated on the antimesenteric wall of the bowel, and

Benign and malignant components in the same colonic adenomatous polyp.



Invasive adenocarcinoma with associated fibrous reaction.

Tumor emboli in lymphatic channels.

was approximately 2 cm in diameter with a moderately broad 1.5 cm stalk. The stalk was amputated approximately 1 cm distal to the base of the polyp. Frozen section examination showed an atypical polyp with no evidence of tumor involvement at the point of amputation of the pedicle. The permanent sections, however, revealed a "primary polypoid superficially invasive well differentiated adenocarcinoma rising in an atypical adenomatous mucosal polyp of the sigmoid colon." There was no carcinoma at the point of transection of the stalk. There was, however, evidence of tumor emboli in lymphatic channels.

In view of these findings on April 29, 1967 sigmoid colectomy with a wide resection of the mesosigmoid was performed. The liver was grossly free from metastasis. There were no clinically enlarged periaortic or regional mesenteric lymph nodes. The pathology report was secondary adenocarcinoma in 1 of 9 left perisigmoid colon lymph nodes. There was no demonstrable residual carcinoma at the site of polypectomy.

Metastatic adenocarcinoma in regional lymph nodes.

Comment

The presence of benign and malignant components in the same polyp suggests that malignant change does occur in benign adenomatous colonic polyps.

Microscopic evidence of coexisting polypoid carcinoma and benign adenoma in the same polyp is rare, Spratt, Ackerman and Moyer[3] say that it virtually never occurs, a few cases have been reported from Massachusetts General Hospital, although by in large Castleman, according to Welch,[1] agrees that it is extremely uncommon to find this combination. Blatts[5] autopsy study showed 4 of 465 adenomas contained both benign and malignant epithelium morphologically with clear-cut invasion of the muscularis mucosae or the muscularis proper.

We thought it an interesting observation that tumor emboli were demonstrated in lymphatic channels in the polyp.

The presence of metastatic adenocarcinoma in regional mesenteric lymph nodes is proof that malignant adenomatous colonic polyps do metastasize.

The incidence of carcinoma in polyps 1.5 cm or more in diameter is known to be greater than in smaller polyps. For example, the incidence of malignant disease is under 1% in a polyp 1 cm or less in diameter. This may suggest that adenomatous polyps may indeed become malignant as they grow.

We certainly do not believe that all adenomatous colonic polyps become malignant but the incidence of transformation is high enough so that these polyps should be treated as premalignant or actually as malignant lesions dictated of course, to a large degree, by the size of the polyp.

PUBLIC RELATIONS FOR THE DOCTOR

How The Physician Can Develop A Sound Program

REX F. HARLOW

Because of his function and position in today's society, a doctor practices public relations every hour of every day, consciously or not. He cannot hope for a public relations program worthy of himself, the important function he performs and the distinguished position he occupies, unless he gives it his intelligent personal attention.

It is a task the doctor cannot leave to others but must do himself—earnestly, carefully, and always with an eye to the future. Demands upon him to keep abreast of new developments in his profession are no greater than the demands that he do likewise with his public relations program. How he conducts his practice and how he carries on his public relations are but two parts of his operating system and both parts must function with full efficiency for him to be completely successful.

The doctor has a wonderful opportunity to reap rich rewards from a sound public relations program faithfully maintained and kept up-to-date, thinks Richard H. Blum, Stanford Research Institute scientist. In his book, *The Management of the Doctor-Patient Relationship,* Blum says that respect, awe, and anticipation of special power surround the person of the physician. The strength of this respect and awe are recognizable in the special efforts at politeness, humility, affability and deference which so often characterize the behavior of the adult patient in the relationship.

Patient relations are his most important relations, write Rollin Watterson and William Tobitt in the opening paragraph of their *Doctor and Patient,* a summary of a psychological study of the public relations of the physician and of medicine by Dr. Ernest Dichter. Medical public relations places emphasis on the individual human relationships between doctor and patient, say the authors.

In the Dichter report, considered by many doctors to be the most valuable public relations document presented to medicine, the psychologist places heavy emphasis upon the vital importance of the doctor-patient relationship, and particularly upon the necessity to keep it up-to-date. He makes the charge that medicine has lost its "historical heritage" of community devotion and leadership because the doctor-patient relationship has not changed to fit comfortably into the modern pattern of life. The charge appears to be justified. The doctor today who views himself and his work from the Olympian height once occupied by the family doctor is fighting a losing rear action. No longer can he lord it over patient, community, and all else in his orbit, disdaining to depart from the changed to fit comfortably into the modern pattern he can hardly even serve today as "father confessor." He is living in a different world of Medicare, medical specialists, group practice, rising costs, expanding fees, health insurance, scientific research, and a host of other factors unknown to the family doctor of old.

Rex F. Harlow, editor and publisher of The Social Science Reporter, was the first editor of PUBLIC RELATIONS JOURNAL. He has spent 55 years in public relations as a consultant, educator and author.

How can the doctor develop and maintain a sound public relations program in tune with the times, one that will contribute to his happiness and well-being and expand his usefulness?

His first task is to develop an attitude of genuine interest in public relations. Failure to do this is one of the greatest obstacles the average doctor has to overcome; frequently, lack of interest becomes contempt or antagonism. The doctor has to believe that organized public relations is a necessity in his practice today, that it is on a par with any or all the other activities in which he engages.

Organized public relations: that is the significant phrase in the above sentence. The doctor must gain a careful, realistic view of himself and his work in his community before he can construct an effective public relations program. A hit-or-miss or casual approach to the task will not do. He must ask himself: What kind of person am I? How much do I know about communicating with other human beings, especially patients, community leaders and others outside of my profession who affect me? What do the social and behavioral sciences have to offer me in this connection? Do I know the techniques and tools of public relations? If I do not, where and how can I get help in learning them well enough to serve my needs? These questions will need to be answered before an attempt is made to begin the program.

One requirement, already referred to, which must be met above all others is that the doctor have warm and satisfactory relations with his patients. He must earn and retain their confidence and respect.

Meeting the doctor-patient requirement will call for a keen appreciation and skillful use of communication tools and techniques. Without a sound communication system, the doctor will be lost. He must communicate to his patients his ideas and goals, his whole personality, as well as his explanations and instructions regarding the patient's medical and health needs. Social and behavioral scientists can help. They have long been concerned with communication as one of the great factors in human existence.

Frank Discussion

One of the biggest errors the doctor can make, as social science research indicates, will be to take for granted that his patient will always understand what he says. The doctor must not assume that his patient uses words just as he does; rather he must assume that unless great care is exercised, the patient will often misunderstand what he says. Also, it has been found that people admit into consciousness only those things which interest and promise to benefit them. They exclude those things they do not like or want.

Guided by these facts, the doctor will frankly discuss fees and render accurate, prompt bills, maintain attractive office facilities and hours, make house calls when requested to do so, keep careful patient records, be friendly, frank and cordial in his office contacts, use a follow-up system to reflect his continuing interest in the patient after the latter's visits to the office or his stays in the hospital, and otherwise carry on his practice on a high professional plane that pleases and satisfies his patient.

To these practical, down-to-earth requirements can be added Dichter's recommendations, that the patient's desire for continuity in his relationship with his doctor should be satisfied; the mutual desire of both doctor and patient for appreciation or affection should be satisfied; and the doctor should permit the patient to become an active and informed participant in his treatment, rather than a passive recipient of care.

Dichter has a particularly interesting recommendation on how to deal with the problem of the declining number and influence of the family doctor and general practitioner. He suggests a semantic approach: use a new designation, *personal physician,* to describe the doctor who diagnoses and treats the whole person, and to whom patients can come for psychological-biological counsel and continuing personal aid in *anything* relating to health. Helping to popularize the use and acceptance of the term personal physician should be a part of the doctor's relations with his patients, and with the public at large as well.

After making sure of the effectiveness of his relations with his patients, the doctor's next step will be to utilize his responsibilities and opportunities as a citizen. He will seek to pay his obligation to society by sharing his knowledge, training and talents. Here again he will leave as little as possible to chance. He will determine to the best of his ability his aptitude for public service, and he will look for ways in which he can expect to render the fullest measure of service and reap the

largest rewards. Measuring the amount of time he can allocate to outside activities, he will seek connections within his city, county, state and national medical societies that offer the fullest play to his talents. Without undue haste or pressure, he will establish himself as a progressive, constructive force in society movements which strive for an enlargement and deepening of public knowledge and acceptance of medicine as a powerful and indispensable social force. He will prove himself by working hard and unselfishly in the ranks.

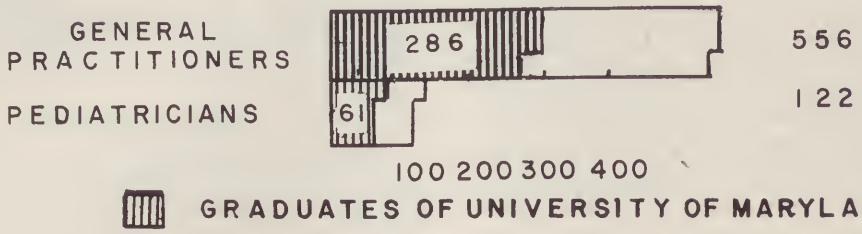
Establish Contacts

While he is building a place for himself in the medical societies, he will also be establishing contacts with worthy community organizations and movements, selecting the ones whose goals, activities and achievements challenge his interest and in which he thinks he will feel most at home. He will study community needs and opportunities in terms of what is happening within the community and the world, and take his place with other thoughtful, dedicated citizens who are working for the public good.

In external relations activities the doctor will do well to heed the warning and advice of Blum. The physician, says the SRI scientist, has a special language, and by virtue of his social role and training also possesses specific beliefs and behavior not necessarily shared by others. He should seek greatest understanding from people of similar status. There will be the greatest degree of *mis*-understanding between him and lower-class people because of the great difference in backgrounds.

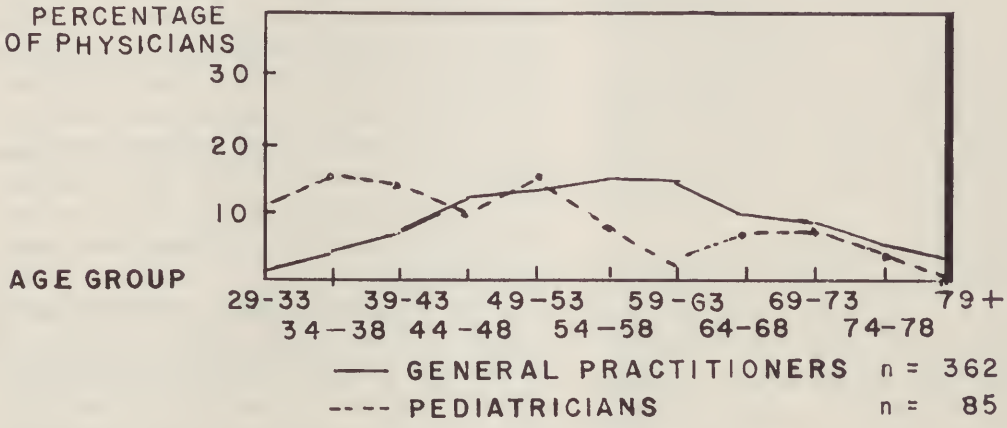
In all his outside contacts the doctor must remember that he is medicine's emissary and spokesman. On all matters of health, both public and private, he will be considered the authority, the person to whom people outside of the medical profession can turn for advice and guidance in making plans and carrying on activities relating to health. Modesty in speech and posture is necessary; at the same time, however, he must be the crusader and educator, one who helps others acquire a fuller and more accurate knowledge of the many values offered by medicine, and who teaches them how best to use that knowledge for the greatest good of the greatest number of people. An inner glow growing out of his love of medicine and dedication to its ideals and goals, demonstrated in his own person and attitudes, will do more to break down unwarranted prejudices and refute misinformed attacks against medicine than anything he will say, regardless of how carefully he marshals his thoughts and chooses his words.

County Society



He may want to merge most of his external public relations activities with those of his county medical society. Leo E. Brown, director of public relations, American Medical Association, sees the county medical society as performing such public relations functions as: providing round-the-clock medical service; establishing mediation committees to arbitrate complaints about doctors; providing medical care for the indigent; publicizing home-town medical facilities; working with communication agencies—the press, radio, TV, etc.; promoting health education; taking a leading part in such community actions as school bond-issue fights, safety campaigns, hobby shows for senior citizens, and the like; stimulating progress in interprofessional relations; building better doctor-patient relations.

The basic burden of organizing and conducting his public relations program rests squarely upon the shoulders of the doctor, where it belongs. He can make as little or as much of it as he will; his is the choice. The quicker he realizes that through mastering the techniques of public relations he will contribute heavily to his own growth professionally as well as socially, the better off he will be. Acquiring the habit and skills of studying people, learning "what makes them tick," mixing with them, working with them, serving them, participating wtih them on behalf of worthy causes, will give him deeper, more accurate insight into all people, his patients included.



The doctor will have much to gain and little to lose by becoming a "first class public relations man." He will grow in stature as a man and a citizen. He will "win his spurs" in public service, take his place as a constructive force in society, contribute to the strength and forward movement of his profession, and enlarge and improve his practice.

VING OFFICE MEDICAL CARE TO CHILDREN

OSCAR C. STINE, MD, Dr.PH
Associate Professor of Pediatrics, University of Maryland

The Problem

In 1940 in the United States there were 352 pediatricians and general practitioners to care for every 100,000 children.[1, 2] In 1961 there were 151 members of these two specialties caring for every 100,000 children. During this 21 year period the ratio of pediatricians rose from 7.3 per 100,000 to 16.3 per 100,000 children, but during the same time the ratio of general practitioners fell from 345 to 135 per 100,000 children.

The National Health Survey showed that only 20% of the children in the United States in the years 1959-1961 were seen by pediatricians.[3] This indicates that a decline in numbers of general practitioners has a major impact on the availability of office care for children. The purpose of this discussion is to examine the present supply of general practitioners and pediatricians in the state of Maryland.

One important alternative to meet the decreasing supply is to increase teaching resources in those areas preparing physicians to deliver office-medical-care for children. Another alternative is to develop new forms of office medical care which will use the skills of each physician more efficiently. In preparation for study of these alternatives we will examine the contribution of the present medical schools in Maryland to the supply of physicians for children in Maryland.

Review of Literature

In 1962 the Committee on Medical Care of the Maryland State Planning Commission showed that Maryland compared favorably with other states in the number of physicians per unit of population. They pointed out that these ratios may not be "a useful index as to a state's needs."[4] Shortages of physicians had been reported to the committee, which the committee interpreted as "distributional." They found that rural areas had low ratios of physicians to population. They recognized the poor indices of health of low income persons in Maryland but attributed these low levels to lack of motivation rather than the availability of physicians. Their data showed that the mortality rate for children under 5 in Maryland is higher than the national average. They did not study the supply of physicians to children as a possibility of distributional shortages.

The Maryland chapter of the American Academy of Pediatrics carried out a comprehensive study of health services to children in Maryland in 1945.[5] The study showed that only 16% of the children receiving medical care on an average day in Maryland were being seen by a pediatrician while 52% were being seen by general practitioners. The others were seen in hospitals' clinics or by other specialists. Care by the pediatricians differed from care by the general practitioner in the proportion of visits given to well children: 58% of the children in a pediatrician's office were well, while 30% of children in the general practice office were well. Less than 6.2% pediatric services were given in rural locations, while 21% of the general practice services to children were rural. Their data showed that 54% of the visits to a general practitioner's office were to patients under the age of 19.

The American Medical Association enumerated the physicians in Maryland in 1966.[6] Out of a total of 5986 physicians, 974 were in general practice and 485 were in pediatrics. Among these physicians serving children only 932 general practitioners and 217 pediatricians were in office practice. Thus less than 45% of the pediatricians in Maryland were in private or group practice. Inspection of the data for the standard metropolitan area of Baltimore showed that 95% of the general practitioners are in "solo, partnership, group or other practice," but only 31% of the

pediatricians are in this category of practice. This means that there are 599 practitioners available for the primary care of children in private offices in the metropolitan area, or 1149 for the entire state.

Comparing these numbers with those in the study of the Maryland chapter of the American Academy of Pediatrics reveals that after 21 years there are 153 more general practitioners and 148 more pediatricians in practice in the state of Maryland. In the same period of time the childhood population under age 15 rose from 434,000[7] to 993,000 in 1960.[8] The number of live births in 1940 in Maryland was 33,347; by 1960 there were 77,350 live births.[9] In 20 years the child population doubled. The number of pediatricians has tripled but the present number is only 19% of the physicians who are available in private offices to children for preventive services, initial evaluation, and treatment of the majority of childhood illnesses.

Enumeration of General Practitioners and Pediatricians, 1966

The trends in entering or leaving practice are reflected in the ages of physicians now in office practice. These trends vary according to the specialty and by geographic location. To understand this variation we selected for study the independent city of Baltimore, the suburbs of Baltimore and 14 cities that are not part of the large metropolitan areas for enumeration of physicians by age, specialty and medical school attended. We used the *Geographic Register of Physicians*[10] as the source of data.

The importance of general practitioners to the care of children in this state is apparent in Graph 1. If general practitioners spend half of their time in seeing children, they are clearly caring for a majority of children receiving private office care. The importance of the State University is obvious as a source of physicians giving personal medical services as well as being associated with locating physicians in this state.

The University of Maryland School of Medicine provided basic medical training for 57% of the general practitioners and 73% of the pediatricians. The Johns Hopkins University School of Medicine produced 3% of the general practitioners and 19% of the pediatricians. The proportion of physicians in these forms of practice graduating from the University of Maryland has remained about the same. By contrast there are markedly decreased proportions of medical graduates from Johns Hopkins in the younger age cohorts. In this sample there are only 5 pediatricians and 4 general practitioners who are graduates of The Johns Hopkins University who are under age 45.

Graph II shows the percent of general practitioners and the percent of pediatricians by age group for the city of Baltimore. The median age for general practitioners is 57 years. The median age for pediatricians is 47 years. Almost one quarter of the general practitioners in the city are over 65 years of age. The trend of decreasing numbers of physicians entering general practice is clear in the chart. The number of pediatricians entering private practice ranged from 9 to 14 for each 5 year age cohort.

Graph III shows the percentage of pediatricians and general practitioners by 10 year age groups in the suburbs of Baltimore and in 14 smaller cities. The decline in general practitioners in the younger cohorts occurred more recently than in the larger city. In these areas there are few pediatricians in the older age cohorts. Examination of the data reveals that the majority of pediatricians in the youngest cohort are in pediatric practice in the small cities.

The effect of physicians entering the armed forces requires further study. In 1966 there were no general practitioners in our sample under age 29.

Discussion

The increasing number of children in Maryland is only part of the increasing demand for medical office care for children. Since one-half of the visits to the pediatrician's office are for well children and only one-third of the visits of children to the general practitioner are for well child care, a shift to a larger proportion of child care by pediatricians will result in a higher number of visits per child per year. The national health survey of 1963 revealed that children in families with incomes over $7000 made almost three times more visits to physicians' offices than children in families with incomes under $2000.[3] This suggests that increasing annual incomes of families in the state of Maryland will be accompanied by further demands for office care.

The geographic distribution of pediatricians

and general practitioners indicates that the family in the large city will have increasing difficulty in finding office medical care for their children. In the same area it is clear that the retiring general practitioners will not be replaced by young pediatricians if present rates of entry to the private office of pediatrics in the city continue. With increasing case loads in a private practice more families accustomed to private office care will have to turn to emergency room and outpatient department services. The trend is already evident in the experience of many hospitals. Among the undesirable effects of increasing use of emergency rooms and outpatient departments, according to Bergman's observations, is the 50% of patients in a medical center's emergency room who did not have complete immunizations.[11]

At the same time that the supply of office services to children is decreasing, leading teachers of pediatrics are emphasizing the need for more attention to problems related to child development, emotional problems and the social problems of the families. A constructive response to the limitation of pediatric time in the face of social problems among private patients have been the incorporation of social work practice in a pediatric office.[12, 13] This is an example of how increasing demand for child health services might be met by development of new forms of practice among private practitioners.

The number of physicians serving in the armed forces is another factor in the reduction of numbers in the lower age cohorts. The large number of pediatricians in Maryland, and especially Baltimore, who are not in private practice indicates that persons who desire private physicians must compete with administrative, educational and research positions that are attractive to pediatricians. Modern medical education seeks to prepare its graduates to keep abreast of changes in the understanding of disease and of new developments in diagnosis and treatment which require critical evaluation based on principles of research. This effort tends to emphasize the laboratory and scientific aspects of training but tends to attract young physicians away from their plans for an office practice. To change the trend illustrated in our enumeration of physicians by age group, major changes in education must reveal equal intellectual excitement and greater personal rewards in giving optimum health and medical care.

Conclusions

One half of the general practitioners in the state of Maryland are 57 years of age or over. There are decreasing numbers of general practitioners in the younger age cohort.

Although the number of pediatricians in Maryland has tripled in 20 years, they only comprise 19% of the physicians in the state giving primary medical care to children. The greatest increase in the number of pediatricians was in the small cities. The rate of entry of pediatricians to private practice in the metropolitan area apparently reached a plateau below usual levels for the youngest age cohort.

Fifty-seven % of the sample of general practitioners and 73% of the pediatricians in Baltimore, its suburbs, and 14 smaller cities, graduated from the University of Maryland School of Medicine.

Continuing increase in child population and increasing demand for well child care will not be satisfied by present educational resources and patterns. The author pleads for an increase in teaching resources as well as efforts to develop new forms of office practice.

Isadore Tuerk, MD, To Retire in July

Isadore Tuerk, MD

Isadore Tuerk, MD, Commissioner of the State of Maryand Department of Mental Hygiene, has announced his impending retirement.

A native of the Greene Street area of Baltimore now occupied by the University of Maryland Hospital, Dr. Tuerk attended P.S. School No. 1, Baltimore City College, Towson State Normal where he gained a teaching certificate, and was graduated from The Johns Hopkins University in 1930 with a BS degree in Biology with a Chemistry minor. In 1934, Dr. Tuerk was graduated from the University of Maryland Medical School and served his internship at Baltimore City Hospitals.

It was during his internship that contacts with patients interested him in emotional illness. In 1936 Dr. Tuerk became Assistant Psychiatrist at Baltimore City Hospitals and a year later entered State service as Assistant Psychiatrist at Eastern Shore State Hospital. He became Senior Assistant Psychiatrist there in 1939.

During the war he was commissioned a first lieutenant and served in the European Theater with the 80th Infantry Division. He was honorably discharged in 1946 and was awarded the Bronze Star. Following the war, Dr. Tuerk joined the staff of Spring Grove State Hospital as Clinical Director and became Superintendent in 1949. Governor J. Millard Tawes appointed Dr. Tuerk to the Department of Mental Hygiene as Acting Commissioner in 1959 and in May, 1960, he became Commissioner.

Following his retirement in July of this year, Dr. Tuerk plans to add to his 32 years of service to Maryland's mentally ill and retarded by continuing the Saturday alcoholic clinic at University Hospital—a program he has conducted for over 10 years; and by furthering his work with a group therapy session for parents of retarded children.

Dr. Tuerk's retirement is definitely a misnomer. He intends to divide his time between the aforementioned projects, and the Psychiatric Institute of the University of Maryland, the Enoch and Sheppard Pratt Hospital and private practice.

Outside of his professional life, Dr. Tuerk has a wide range of interests. He enjoys classical music, especially Beethoven, Bach and Brahms, and loves opera and the theater. He is a true Baltimorean in that he is an avid fan of the Colts and the Orioles.

Numbered among his organizational abilities stemming from his active teenage life is his fame as what he terms a "good" checker player which enabled him to run the checker concession at Carlin's Amusement Park. The concession involved about 10 checkerboards with Dr. Tuerk playing as many as 7 games simultaneously. If Dr. Tuerk won, the loser paid a nickel for the privilege of playing. If Dr. Tuerk lost, he dutifully presented the winner with a nickel cigar.

While attending The Johns Hopkins University's evening and summer sessions, Dr. Tuerk taught manual arts subjects at Pimlico Elementary School and coached the school's basketball team—another indication of his limitless energy and resourcefulness.

Dr. Tuerk was married in 1930 during his first year in medical school to the former Helen Blumberg, also of Baltimore. They have two sons, Jonathan, born in 1939, and Richard who entered the world in 1941. Jonathan is now in his second year of residency in Psychiatry at the Connecticut Community Mental Health Center in New Haven. Richard is an Assistant Professor of English at the University of California at Riverside.

Aside from Dr. Tuerk's already diversified life he expects to have another dimension added this summer when he becomes a grandfather.

Your MEDICAL FACULTY at Work

JOHN SARGEANT EXECUTIVE SECRETARY

The Executive Committee at its January 4, 1968, meeting took the following actions:

1. Agreed to obtain a legal opinion as to whether or not technicians could remove tissues or organs from cadavers when they are to be used for research purposes only, under the present law.
2. Agreed to work with representatives of the Attorney-General and the Bar Association to consider any legislative changes that might be necessary in connection with transplantation of human organs, in the light of recent international developments in this area.
3. Approved reappointments of physicians to the Medical Advisory Committee to the Red Cross Blood program.
4. Approved a list of physicians, one of whom will be selected by the Maryland Association of Medical Assistants as an advisor.
5. Agreed to obtain a legal opinion with respect to reinstatement of members who resigned because of the $50 assessment levied on February 20, 1965.
6. Referred to the Public Relations Committee a suggestion that the Faculty sponsor a statewide program on Health Care of the Poor.
7. Agreed to support Implied Consent legislation dealing with a 10% blood alcohol level to be considered the level at which a driver be considered unfit to drive.
8. Agreed to direct a letter to the Governor's Task Force on Executive reorganization urging the Faculty be given an opportunity to discuss any proposed changes in operation of the Board of Medical Examiners office.
9. Heard that a list of names for possible appointment to a special group to evaluate all health operations in the State was to be submitted to the Governor for his consideration.
10. Requested the Treasurer to recommend other ways to finance MEDIC operations now costing $20,000 per year from the Faculty's Educational Fund.
11. Authorized the expenditure of up to $125 from the Educational Fund for the purchase of the booklet, "Manual on Alcoholism," for distribution to Faculty members on request.
12. Approved the following personnel policy, the procedure currently being followed:

> That the Med-Chi Insurance Trust reimburse the Faculty for total salary and other expenses involved in the operation of the Trust, as defined in the Trust agreement; with the understanding that total salaries will be determined by the Faculty's Executive Committee in line with Faculty personnel policies.

13. Agreed to sponsor a program on Use of Blood Components, scheduled to be presented at The Johns Hopkins Hospital.
14. Agreed the Faculty should not take any position in connection with hospital medical staff rulings on the performance of diagnostic procedures, unless a specific request is received from a hospital medical staff.

A service of the Heart Association of Maryland

PROBLEMS IN PREVENTING INITIAL ATTACKS OF RHEUMATIC FEVER

MILTON MARKOWITZ, MD, LEON GORDIS, MD, ROMEO RODRIGUEZ, MD

In 1950, Denny and his associates[1] demonstrated that adequate treatment of the preceding streptococcal infection decreased the attack rates of acute rheumatic fever. These studies provided a rational basis for the primary prevention of this disease.

In an effort to reduce the incidence of first attacks, considerable emphasis has been placed on the need to accurately identify beta hemolytic streptococcal infections in children and recommendations have been formulated for the type and duration of therapy needed to eradicate these organisms from the pharynx.[2] While the incidence of acute rheumatic fever is declining, the disease has not been eradicated. In Baltimore, for example, during a 5-year period, 1960-1964, 263 patients were discharged from hospitals with a diagnosis of a *first* attack of acute rheumatic fever which met the Jones Criteria.

In order to assess the potential preventability of these attacks, the histories of these patients were analyzed with respect to the occurrence and management of the preceding respiratory infection. Such information was available for all but two of the 263 patients. These patients fell into three main groups:

Group A: No History of Respiratory Infection

Eighty-nine of the 261 patients, 34%, had no symptoms of a significant respiratory infection prior to the attack of rheumatic fever and therefore had no reason to come to the attention of a physician for treatment. Thus, it was not possible to prevent rheumatic fever in these individuals with asymptomatic streptococcal infections. Since this group comprised a third of the patients, it is clear that the occurrence of such infections seriously limits our ability to completely eradicate rheumatic fever.

Group B: Respiratory Infection, Physician not Consulted

Of the 261 patients with initial attacks of rheumatic fever, 172, or 66%, were associated with a history of a respiratory infection. Information with respect to medical care was available for 161 patients. Seventy-two, 45%, did not consult a physician at the time of their infections.

The reasons why these individuals did not seek medical care are not known. Thus, it is apparent that a large number of patients still are not brought to physicians for diagnosis and treatment of respiratory infections. This represents a second factor for the failure to eradicate first attacks of acute rheumatic fever and is a factor which is particularly important since adequate medical care can potentially prevent rheumatic fever in this group.

The relationship of the lack of medical care to rheumatic fever probably accounts, in large measure, for the fact that rheumatic fever is much more common in the lower socioeconomic group than in that segment of the population under continuous medical supervision. Efforts to diminish the rheumatic attack rate among this group of

From the Department of Pediatrics, Sinai Hospital of Baltimore.

patients requires public education, patient motivation to obtain medical care early, and increased availability of physicians. These factors invoke complex problems and cannot be immediately remedied. It is therefore unlikely that at the present time, an effective large scale program of primary prevention can be successfully carried out in Baltimore.

Group C: Respiratory Infection, Physician Consulted

Only 89 of the 261 patients, 34%, were seen by physicians for the respiratory infection which preceded the attack of rheumatic fever. Furthermore, throat cultures were performed in only 20 of these patients. Several studies have shown that it is often difficult to make a diagnosis of streptococcal pharyngitis on clinical evidence alone[3, 4] and that except in patients with scarlet fever, an accurate diagnosis can usually only be made by throat culture. Other studies have shown that streptococcal infections are often inadequately treated by physicians and represent still another important cause for failure to prevent rheumatic fever.[5, 6] The failure to make an accurate bacteriologic diagnosis of the respiratory infection will often result in improper treatment. Thus, in order to further diminish the attack rate of rheumatic fever, there is a need to increase the use of throat cultures by all physicians who care for patients with sore throats. Simple and inexpensive methods are available to do such cultures in the physician's office. It should be noted that only 7 of the 20 cultures were positive for streptococci. This suggests that either an inadequate culture was obtained or that the culture was taken after the use of antibiotic therapy was instituted. When a throat culture is done properly, a positive result will be obtained in over 90% of patients with acute streptococcal infection.

Summary

In summary, the histories of 261 patients with a valid diagnosis of acute rheumatic fever were reviewed in an effort to analyze the reasons why these attacks were not prevented. One-third of the patients had an asymptomatic streptococcal infection prior to their rheumatic attack and therefore were not within reach of presently available methods to prevent this complication. Another third had a symptomatic respiratory infection but did not seek medical care. In addition, a third of the patients developed rheumatic fever although they were seen by physicians for the preceding respiratory infection.

Since throat cultures were obtained from very few of these patients, it is possible that the presence of a streptococcal infection was not recognized and that appropriate antibiotic therapy was not prescribed. Thus, improved efforts to eradicate rheumatic fever will require community education, increased availability of medical care, especially for the indigent population, and physician education in the use of throat cultures and the proper therapy of streptococcal infections.

ANNUAL MEETING—
A WELL-ROUNDED
MEDICAL
CONVENTION
APRIL 17 - APRIL 28

(See pages 6 and 7 for more information)

Baltimore City Health Department

ROBERT E. FARBER, MD, MPH, COMMISSIONER

SOME NEW DIRECTIONS

The *Weekly Letter to the Mayor* of December 8, 1967 following the inauguration of Thomas J. D'Alesandro III as Mayor of Baltimore City points up some new health department thoughts in improving the city's health. The letter is as follows:

"For some time this Department has recognized the necessity for redirecting its program to meet the health needs and aspirations of the changing population of the city. Hard core problems such as tuberculosis, venereal disease, unsanitary environmental conditions have served to be so intimately locked up with depressed social and economic conditions that conventional public health means of intervention have yielded but modest results. For this reason, we welcome the new and vigorous program of social and economic improvement and of equal opportunity which will be central to your administration. Improvements of this type will have beneficial health effects.

"The disadvantaged residents of the city who number more than 200,000 have a great need for public services to be visible and accessible. In particular this is true for assistance in maintaining housing standards and for basic health services. Your proposal for multipurpose neighborhood service centers will, when implemented, assemble public efforts on behalf of city residents so that the fullest benefits can accrue to Baltimore's citizens. The City Health Department will cooperate fully in achieving decentralization of services to the neighborhood level.

"The need for decentralization derives not only from considerations of effectiveness and efficiency. There must be greatly expanded opportunity for the neighborhood groups to assist in solving major problems which simply won't dissolve solely through government efforts. Increasingly, elderly persons or couples are left on their own. In times of temporary illness they may become completely dependent. When given no assistance by neighbors or family, permanent loss of home becomes a real possibility. The problem of teenage pregnancy, out of wedlock, is one which requires the attention and intervention of local neighborhood groups. As the multipurpose centers develop, the hope is that local neighborhood associations can acquire a skill in solving local problems of note. In this regard, the City Health Department will stand ready to provide speakers and all possible assistance to neighborhood associations as they come to grips with their local problems."

Robert E. Farber, MD
Commissioner of Health

Maryland Association of Medical Assistants

AWARDS RECEIVED

Two Maryland Medical Assistants received awards at the American Association of Medical Assistant's 11th annual convention in Los Angeles in October.

Dorothy Hartel of Baltimore was awarded a plaque for meritorious service and Mabel Young of Cumberland received an award for percentage membership increase in Allegany County.

Dorothy Hartel, left, and Mabel Young, officers of the Maryland Association, display awards received at the 11th annual convention in Los Angeles in October.

MARGARET SWANK ELECTED AAMA PRESIDENT

Mrs. Margaret Swank, Newark, Ohio, was installed as president of the American Association of Medical Assistants at its 11th annual convention, Oct. 11-15, Los Angeles.

A certified medical assistant, Mrs. Swank has been employed by Carl L. Petersilge, MD, a Newark pediatrician, for the past 15 years.

Other officers elected for 1967-68 were: Mildred Crawford, President-Elect, San Antonio, Tex.; Ruth Dize, Vice President, Norfolk, Va.; Pauline Hunter, Secretary-Treasurer, Phoenix, Ariz.; Betty Lou Willey, Speaker, Port Huron, Mich.; and Juanita Ainsworth, Vice Speaker, Dallas, Tex.

In a luncheon address during the convention, Milford O. Rouse, MD, Dallas, president of the American Medical Association, said the preservation and improvement of the physician-patient relationship will depend, to an increasing extent, upon the role the medical assistant plays in the doctor's office.

Dr. Rouse told the more than 900 medical assistants attending the convention that medicine has been accused of changing and destroying this MD-patient relationship, and of letting medical care become too automated and too impersonal by using the increasing demand for medicare service as an excuse. He urged both physicians and medical assistants to see that medical care remains personal care.

Two pharmaceutical companies—Merck, Sharpe and Dohme and Lederle Laboratories—announced renewed support of AAMA's education programs by each contributing $5,000.

Since 1962, Merck has supported AAMA's certification program designed to establish professional standards and goals for medical assistants.

For the second year, Lederle has contributed to the approval program which will establish guidelines for approving schools offering medical assistant training.

State of Maryland

Department of Health

WILLIAM J. PEEPLES, MD, MPH, COMMISSIONER

Funds Requested for Medical Assistance Payments

The $92.6 million requested by the Health Department for operation of the Medical Assistance Program during fiscal year 1969 includes $16,500,000 for payments to physicians, an amount double the 1968 appropriation. Of this sum, $7,500,000 is designated for payment for services in hospitals, based on "usual and customary" fees. The request is subject to approval by the Bureau of Budget and Procurement and by the Governor before being presented to the General Assembly. Last year's Medical Assistance Program budget request of some $65 million was pared to $45 million at final passage. The Governor has announced plans to request a $5 million emergency appropriation to make up the deficit in the current program.

HIGHLIGHTS

New Guide to Health Educational Aids Published

An updated edition of A GUIDE BOOK DESCRIBING PAMPHLETS, POSTERS AND FILMS ON HEALTH AND DISEASE has been issued by the Department's Division of Health Education. First published in 1960 and revised in 1964, the guide has been out of print for 6 months. The third edition was prepared in response to requests from former and potential users. This comprehensive reference contains annotations of free and inexpensive pamphlets and posters on various aspects of health and disease, with information on where they may be obtained. Films which may be borrowed from the Department's film library are summarized.

Past editions have been helpful to physicians, health personnel, educators, librarians, etc. Copies may be ordered from the Division of Health Education at $2, and lots of 100 or more may be purchased at quantity rates.

Dental Program Curtailed

As of December 1, at the request of the Governor, dental services reimbursable under the Medical Assistance Program were limited to acute needs. These include the relief of pain, control of bleeding, treatment of fractured bones, teeth and soft tissue injuries, treatment of acute infections, and repair of dentures. Fillings, multiple extractions, new dentures, fluoride treatments and preventive examinations were excluded. The cutback was necessary because the 1968 appropriation of $641,865 was exhausted in the first quarter of the fiscal year. The Department has requested $5,250,000 for fiscal year 1969 to cover proposed expansion of services and continued increase in usage.

Medic PKU Program "Top Rated"

In both size of listening audience and interested discussion following the formal presentation, the "Guthrie Screening Program in Maryland," presented recently on MEDIC by the Division of Mental Retardation, was the most successful in the two-way hookup's history, according to MEDIC's director. With 27 of the 32 MEDIC stations tuned in, the program was attended by 629 persons, chiefly public health nurses, nurses working in newborn nurseries and obstetrics, and nursing students and instructors. Purpose of the program was to familiarize nurses statewide with the method of performing the Guthrie Test for phenylketonuria, and the relationships between State and local health departments and hospitals charged with the implementation of the law enacted by the Maryland Legislature last year.

Chiefly responsible for the planning and coordination of the program was the Division's Public Health Nurse Consultant. Other Division personnel participated, as well as the Acting Director of the Bureau of Preventive Medicine, a technician from the Bureau of Laboratories, an audio-visual specialist from the Division of Health Education, and MEDIC's secretary from the Medical and Chirurgical Faculty.

Laboratory Expansion Urgently Needed

Technological advances in identifying and measuring environmental pollutants have outstripped the laboratory facilities of the Health Department. Increasing demands for determinations of air pollutants such as offensive odors and cancer-producing substances, for food contaminants such as copper and cadmium in oysters, and for sampling of sewage and water supplies, have overburdened the laboratory's present capacity. As these studies are essential and pressing, and completion of the new Central Laboratory is not expected before 1970 or 1971, immediate consideration must be given to expanding facilities in the interim. This will require the rental of considerable additional space for laboratory use.

Health Fair Exhibits Well Attended

An estimated 123,700 persons attended the recent Health Fair at the Baltimore Civic Center. One of the three Department displays was on air pollution; the second, a pictorial exhibit on the three major facets of public health—preventive medicine, medical services and environmental hygiene; and the third, entitled "Cigarette Country," depicted a cemetery with six grave-stones bearing four-line epitaphs satirizing cigarette advertising. This exhibit, created and designed by a staff member of the Division of Health Education, received much attention and press publicity. The displays are available for use in local areas.

In support of the Department's program for diabetes detection, the Bureau of Laboratories has assumed responsibility for quantitative glucose determinations by a rapid automated method on blood specimens collected in diabetes screening at the Health Fair.

Meat Inspection Legislation

Maryland's Legislative Council recently approved proposed legislation which sets standards for meat inspection and gives jurisdiction over the entire area of meat control to the State Board of Agriculture (University of Maryland Board of Regents). If enacted, this bill would remove the Health Department's authority to inspect meat packing facilities and exercise control over sanitation, and would create a second extenisve food inspection program in the State to supervise approximately 2% of the State's total food supply.

Since 1890, when the Health Department was charged with protection of the public food supply, human cases of animal-borne disease during the years have been reduced almost to the vanishing point. Salmonellosis, the principal disease threat of red meats, results primarily from improper handling—a situation which may occur at any point in the chain from the place of slaughter to the housewife's refrigerator.

The Department believes the inspection of food handling facilities, especially the points at which food is processed and packaged for and distributed to the consumer, is of primary importance, and best handled by persons whose only concern is protection of the health of the public. It also believes that supervision over food control, whether or not it involves inspection of meat, should be the province of the Health Department, and not an industry oriented function.

Parents of Children With PKU Compare Notes

Parents of children with phenylketonuria, who are being jointly followed by The Johns Hopkins Hospital and the Department, are sharing their experience and updating their knowledge of the disease and its management. Personnel from the Division of Mental Retardation are participating in the two meetings, held at the Hospital and led by the Assistant Professor of Pediatrics and his staff.

"Self-Help" Passes 100,000 Mark

More than 100,000 persons have graduated from the Medical Self-Help training program sponsored by the Division of Emergency Health Services. The free 16-hour program, developed by the U. S. Public Health Service and designed to prepare citizens to meet disaster situations when physicians' services may be unavailable, has been offered since 1963 through secondary school systems, both public and private, and through hospitals, community agencies, and other interested groups.

The course includes training in Radioactive Fallout and Shelter, Healthful Living in Emergencies, Artificial Respiration, Bleeding and Bandaging, Fractures and Splinting, Transportation of the Injured, Burns, Shock, Nursing Care of the Sick and Injured, Infant and Child Care, and, except where it is believed inappropriate, Emergency Childbirth. The Division hopes to reach at least one member of each Maryland family with the program.

Rehabilitation Notes

DOUGLAS G. CARROLL, MD, EDITOR

CARDIAC REHABILITATION PART III— *Follow-up after Myocardial Infarction*

DOUGLAS G. CARROLL, MD
Physical Medicine and Rehabilitation
Baltimore City Hospitals

Technical advances and new administrative (Coronary Care Units) aspects of treating patients with acute myocardial infarction are being vigorously and enthusiastically backed by the American Heart Association. In the preoccupation with technical matters and organization, the importance of the follow-up may be overlooked.

The recognition of anxiety and depression is important in the hospital; it is of even more importance during recovery. Myocardial infarction differs from many other common diseases in that by and large the patient either dies within a few months of the acute attack or recovers completely without any crippling neurological, mental or orthopedic disability.

Psychological Reactions after Myocardial Infarction

Depression, anxiety and fear are almost universally present and really are only abnormal when they persist for a prolonged period. These reactions may be easily overlooked since their principal manifestations may be lassitude, weakness, palpitation—all symptoms compatible with heart disease.

A second reaction is invalidism, occurring particularly in patients seeking escape from some intolerable situation, present prior to myocardial infarction. The heart attack turns out to be a socially acceptable reason for retirement from business or withdrawal from the rough and tumble of life.

Denial of illness is a third reaction. It is seen in patients of high intelligence who for various reasons are unable to accept a disability or the threat of sudden death.

The Recovery Process

Callahan et al[1] have recently described the general recovery process after an acute illness. "Role" is defined as a socially recognized pattern of behavior of persons in certain positions. The *sick* role relieves the patient of all other responsibilities and obligations. The sick person is expected to allow himself to be cared for by others, but at the same time he is expected to give up the sick role as soon as possible. The passive invalid-prone patient accepts the sick role eagerly and is slow to give it up. Patients who deny illness refuse to assume the sick role.

Most patients in the sick role react to their illness with a period of mourning and depression. Emotional interest is withdrawn from family and friends and centered on the patient himself. There is also hypochondriacal fussiness over small symptoms which might otherwise be disregarded.

The great majority of patients accept the obligation to throw off the sick role at the earliest possible moment. Patients normally want to regain some sort of recognized status in society. They want to love, to be loved and to be understood. Concentration on capabilities rather than on handicaps reenforces recovery process in most patients.

Generally there are three levels of relationship between the patient and the health team. During the acute life-threatening stage of the disease, the patient is completely passive and dependent on the health team. Following this, there is a relationship of guided cooperation when the patient is expected to increase activity gradually and accept advice and treatment without argument.

The final relationship is that of mutual partici-

pation. The patient is given more authority and with it more opportunity to disagree and to modify the advice and participation of the health team.

Factors Influencing Return to Work After Myocardial Infarction

Lewis[2] has studied a group of patients with congestive heart failure and has compared the characteristics of those who returned to work with those who became invalids.

The men who returned to work had only mild heart failure and were often able to discontinue digitalis. They had been employed during the past five years, had a high school education or better, saw their physician regularly. These men were generally "white collar workers," but if a "blue collar worker" they belonged to a union.

They were unknown to welfare agencies, were optimistic, resumed off-job activities as well as sexual activities. Their families neither rejected nor over-protected them.

The man who did not return to work had none of these favorable aspects. Lewis is quite pessimistic as to how these latter patients can be helped to achieve vocational independence.

Compliance With Medical Directions After Discharge from the Hospital

Davis and Eichhorn[3] studied 400 farmers in central Indiana in 1955 and again in 1960 in an attempt to find out how well these farmers followed their doctors' directions.

Seventy-one percent of the patients with heart disease had arteriosclerotic heart disease, 16% hypertensive heart disease and the remainder had rheumatic, congenital or some other type. About 30% of the group admitted some discrepancy between the doctor's advice and their actual behavior. The patients tended to adhere to advice that involved the least amount of difficulty in effecting a change in activity.

Farmers who were very highly work-oriented tended to comply less well than those who had low work orientation. Hard work in itself seemed to be valuable to these people. If the doctor's directions conflicted with the patient's work habits, he disregarded the doctor's advice. Also, higher educational levels were associated with less compliance with physician advice.

Donabedian and Rosenfeld[4] studied patients who had been discharged from the hospital with definite recommendations as to future care. About 30% did not comply with any recommendations.

Summarizing the two above mentioned articles, there are four major reasons why compliance with doctors' orders was not accomplished:

1. Faulty physician judgment: The physician misjudged either the degree of recovery of the patient or the potentiality of the family to carry out directions. The patient arrived home and was either unable to perform at the expected level or the family was unable to supply the promised services.
2. Misunderstanding of Physician's direction: The patient was judged to understand what he was to do at home but in actual fact the patient did not understand. This failure of communication may result from the patient's stupidity, but this intellectual deficit should be recognized prior to discharge. This is not alway done, one reason being that the doctor does not make a real effort to see the problem through the patient's eyes.
3. Change in family attitude: The family changes its attitude or loses enthusiasm when it finds what is required to fulfill the patient's needs at home.
4. Complicated directions: It is essential for the physician to simplify directions to families. Davis' study showed that the greater the number of directions given the patient, the less likely he is to carry them out. This also applies to the number of medications given.

Summary

Significant advances are being made in the hospital treatment of patients who suffer acute myocardial infarction. Much less attention has been given to what happens to patients after discharge from the hospital. If full alvantage of the advances in Coronary Care Units is to be accomplished, more attention must be given to the care of patients after discharge.

THE INCIDENT REPORT

The foregoing title may, to some, suggest a cloak and dagger paperback novel. To the defense attorney upon whose shoulders has fallen the burden of defending a lawsuit in which an incident report is involved, the title frequently suggests a courtroom nightmare—from which he can neither escape nor awaken.

Many years of experience with incident reports leads a defense lawyer to dread what he may find in them. Of course, the report is simply, at least in theory, a factual recitation of an event (the word "accident" is usually avoided) which involved, or resulted in, injury or damage to the person or property of a patient. Execution of the report is customarily the immediate responsibility of the supervisory personnel and will generally embody statements of those who are directly, or indirectly, involved in the matter including, where appropriate, witnesses of the event.

However, since many weeks, or more hopefully, months may intervene between the occasions when such reports must be prepared, these written records usually comprise a conglomeration of conjecture, hearsay, guesswork and fact. Moreover, the details are frequently obscured or colored by emotional, self-deprecatory statements through which nursing personnel and others involved seek absolution through confession.

While it is true that incident reports must be honestly composed and fully and fairly present the facts that are known, for example, about an injury sustained by a patient, nevertheless, admissions of guilt, or responsibility, either real or assumed, should not be included in these reports. Guilt and responsibility may very well be apparent, or be deducted from the facts presented, but such *conclusions* have no proper place in the incident report itself.

This is not to imply that the report should be slanted, distorted, evasive, or written in such a manner as to conceal facts or mislead one. Aside from the moral implications, such dishonesty, if discovered and disclosed in a court of law, can have disastrous consequences. Both judges and juries dislike being deceived.

It is interesting to note how frequently hospitals will engage in what is usually an exercise in futility in seeking to prevent opposing attorneys from procuring the incident report when such a report has been prepared. Almost invariably the report must ultimately be surrendered. It has been suggested when such reports must be prepared, that the hospital attorney be consulted directly by the hospital employees (nurses, etc.) involved and the relationship of the attorney-client being thereby established, the incident report becomes "privileged" and need not be revealed except with the consent of the hospital employee. Whether this device will accomplish the intended purpose will depend on the facts in each case, and should be "cleared" with both the hospital attorney and the governing body of the hospital.

At the very least, a firm and uniform policy covering preparation of these important records should be clearly established. Too, there should be initiated a strict program of educative quality control which should include a review of those reports three or four times a year with the hospital attorney. In this manner careless, inept, and improperly executed reports, which may constitute a legal hazard, can be detected and corrective measures taken to avoid pitfalls and prevent bad habits from becoming routine.

It should never be assumed that hospital employees, of whatever status, are capable of preparing incident reports without some type of assistance, surveillance, supervision, or review. Such assumptions have produced the defense attorney's nightmares to which reference has heretofore been made. Truly they cause Excedrin headaches.

BELDEN R. REAP, MD

State of Maryland
Department of Mental Hygiene

ISADORE TUERK, MD, COMMISSIONER
KURT GORWITZ, ScD, STATISTICS DIRECTOR

THE HOSPITALIZED MENTALLY SUBNORMAL

Accurate data on the number of mentally retarded is not available. However, it is commonly estimated that at least 3% of the population—or six million Americans and 110,000 Maryland residents, have a measurable intelligence quotient (I.Q.) of less than 70. Added to this number, every year more than 100,000 babies, including 2,000 in Maryland, are born mentally subnormal. In addition, many children who are born with normal intelligence become functionally retarded because of cultural, familial and socio-economic deprivation.

Five out of every 6 retarded persons are believed to have an I.Q. level between 50 and 69 and most are publicly identified solely through testing programs and special classes provided by the various school systems. Since only a small proportion subsequently come into contact with treatment agencies, it should be clear that the bulk of the adult retarded must be functioning, in some manner, as community members.

The American Association on Mental Deficiency recommends between 1.1 and 2.0 beds for the care of the mentally retarded per 1,000 total population. Based on Maryland's current population of 3.7 million, this would be equal to 4,100 beds. At the present time Rosewood and Henryton, Maryland's hospitals for the mentally deficient, have 3,100 patients and privately operated facilities provide less than 100 additional beds. Latest available data, for 1966 published by the National Institute of Mental Health, indicates that Maryland had .84 beds in these two facilities for every 1,000 residents and was 14.6% below the national figure of .99. Thirty-two other states had a higher ratio.

Although the number of beds in these two facilities has increased two-thirds in the last 10 years, Maryland's relative position has remained essentially unchanged. In 1956, it ranked 30th and was 18.5% lower than that year's national ratio of .90. In 1961, Maryland was reported to be 32nd with a bed ratio of 17.8% below the national average of .93. Current construction of a new hospital in the Washington suburban area will raise the ratio of beds to population slightly, but will still leave Maryland below the majority of other states. Construction at Rosewood is limited to replacement of existing units scheduled for demolition.

Under present conditions, it must be expected that the number of retarded in Maryland requiring inpatient services will increase by at least 100 per year. The immediate need therefore is for the continuing construction and staffing of additional facilities.

The ultimate solution is dependent upon five major factors:

1. Research into the causes and means of prevention of mental deficiency.
2. Expanded and intensified prenatal services for expectant mothers known to have a high probability of having a premature delivery since the incidence of mental retardation is very much higher among such births than among full-term deliveries of normal weight.
3. The success of Head Start and other programs to minimize the effects of cultural, familial and socio-economic deprivation.
4. Increased training and educational programs for the retarded to permit the maximum development of their potential.
5. The establishment and expansion of closely coordinated community centered facilities and supportive services, such as day-care centers, half-way houses, sheltered workshops, group care homes, small residential facilities and other suitable substitutes for hospitalization. These are presently nonexistent or functioning only on a minimal basis.

when he just can't sleep

Tuinal

One-Half Sodium Amobarbital and
One-Half Sodium Secobarbital
supplied in ¾, 1½, and 3-grain Pulvules

Tinal helps wakeful patients fall asleep fast, stay asleep all night.

Indications: Tuinal is indicated for prompt and moderately long-acting hypnosis. It is not suitable for continuous daytime sedation.

Contraindications: Barbiturates should not be administered to anyone with a history of porphyria, nor should they be given in the presence of uncontrolled pain, because excitement may result.

Warning: May be habit-forming.

Precautions: Tuinal should be used cautiously in patients with decreased liver function, since prolongation of effect may occur.

Adverse Reactions: Idiosyncrasy, such as excitement, hangover, or pain, may appear. Hypersensitivity reactions occur in some patients, especially in those with asthma, urticaria, or angioneurotic edema.

Overdosage: C.N.S. depression. Symptoms—Depression of respiration and of superficial and deep reflexes, slight constriction of the pupils (in severe poisoning, dilation), decreased urine formation, lowered body temperature, coma. Treatment—Symptomatic and supportive (gastric lavage; intravenous fluids; maintenance of blood pressure, body temperature, and adequate respiration). Dialysis may speed removal of barbiturates from body fluids.

Dosage: 50-200 mg. (¾-3 grains) at bedtime.

Woman's Auxiliary

MRS. HARRY L. BERMAN, EDITOR

MONTGOMERY COUNTY

For the past 14 years, the Woman's Auxiliary to the Montgomery County Medical Society has made funds available to student nurses. This year, Mrs. Harley Williams, of Takoma Park, and Miss Janet Dimmer of Kensington, Md., both students at Montgomery Junior College, were recipients of Nursing Scholarship funds.

Mrs. Williams, a former air-line hostess, entered the nursing program last September and has earned a straight-A average. She, and her husband who is a student at the University of Maryland working for his doctorate in clinical psychology, are co-sponsors and advisors for the senior fellowship group at Northminster Presbyterian Church in Silver Spring.

Mrs. Williams was graduated magna cum laude from Millsaps College with an AB degree in the humanities, and was accorded the honor of being selected "outstanding senior girl." after receiving her master's degree, she plans to teach nursing.

Miss Dimmer is a graduate of Walt Whitman High School and was matriculated in the Nursing Program of Montgomery Junior College in September, 1966.

Her extracurricular activities over the past few years have included being a junior volunteer at Suburban Hospital, working in the school nurse's office, and she has been active in the Medical Careers Club. She was elected Homecoming Princess this year. She hopes to continue her nursing education toward a BS degree.

* * * * *

The monthly meeting in February will take place at the Olney Inn and will feature as guest speaker, Dr. Brian Cowley. The topic of his discussion will be "Deciphering the Adolescent."

PRINCE GEORGE'S COUNTY

The Woman's Auxiliary to the Prince George's Medical Society is emphasizing the society's drive for better health enlightenment by taking "Operation Lighted Lamp" as its theme for 1967-68. The group hopes, through the distribution of various printed matter, to become synonymous with the plea for improved health conditions in the minds of Prince Georgians.

Like its sister county, this group will offer two scholarships to high school graduates in June, 1968. Plans are underway to hold a luncheon-card party in March to raise funds.

The Health Careers Chairman, in cooperation with the County Board of Education is planning a Health Careers Day. Elaborate arrangements are in progress to encourage student interest in medical fields. The entire auxiliary membership is participating as hostesses, guides, information aides, etc.

BALTIMORE CITY

Fifty-eight auxilians of BCWS assisted at the three-day Health Fair in the Civic Center last November. Ruth Vyner's splendid effort in getting the girls out to work deserves enormous praise.

The Auxiliary's benefit, and only fund-raising activity this year, will be a luncheon-fashion show to be held on Monday, March 11th, at the Greenspring Inn. Spring fashions by Dorothy Hess will be featured.

ALLEGANY-GARRETT COUNTY

In keeping with the Health Careers theme, members of the Auxiliary to the Allegany-Garrett County Medical Society have compiled a group of slides representing all aspects of health work to inform young people about health career opportunities. The slides will be shown to high school groups to emphasize the needs and opportunities in the community. Also in progress are plans for a Health Careers Fair in March to be held in conjunction with the Public Schools Career Day.

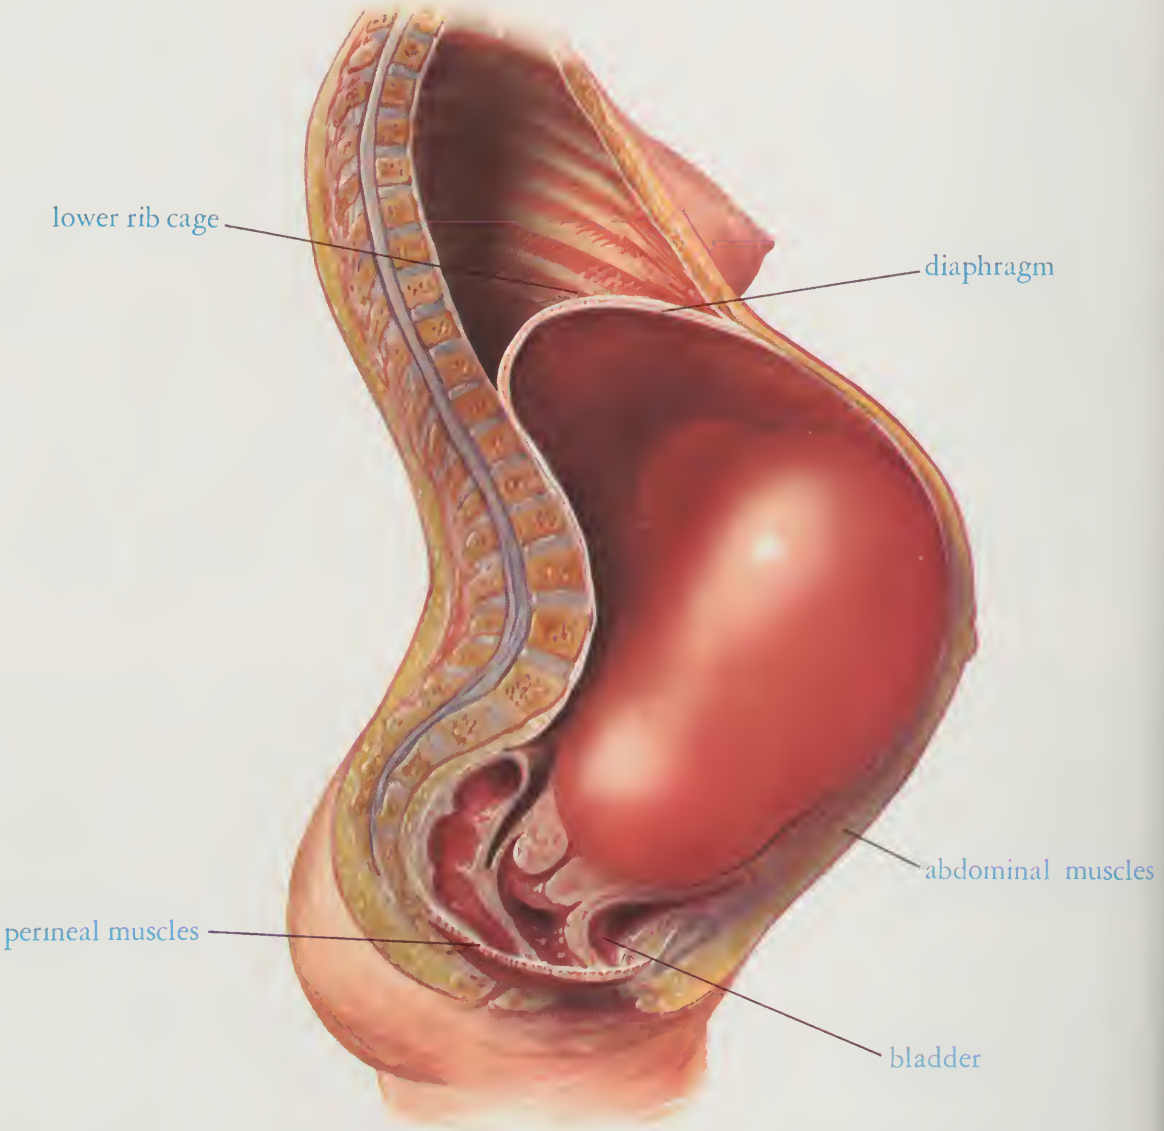
this issue: the cold in pregnancy...



the cold in pregnancy

Frederick W. Goodrich, Jr., M.D.
Senior Obstetrician and Gynecologist, Lawrence and Memorial Hospital, New London, Connecticut

Since pregnancy and the common cold are both ubiquitous, it is not surprising that they often occur at the same time in the same patient. Incidence figures are hard to come by, but the chances are very good that any given pregnant woman will have a cold at some time during the nine months of her gestation. When she does, she will tell you that it is the worst cold she ever had. It seems to last longer and the symptoms are more distressing than they are in the non-pregnant.

For purposes of this discussion, the common cold is considered to be the well-known symptom complex which includes sore throat, stuffy nose, and a cough. Febrile states or extension of the disease process into the lower respiratory tree are not part of the common cold and will not be included in this discussion.

The clinical picture of a cold in pregnancy can be confused by a long-known physiological phenome-

non. Kiesselbach's area in the nose (on the anterior part of the nasal septum above the intermaxillary bone) becomes engorged, apparently due to hyperemia induced by the increased estrogen level which accompanies pregnancy. The amount of congestion can vary in degree from woman to woman. Some have very little congestion, others will have occasional nosebleeds from this area, still others will have symptomatic congestion to the degree that they will complain of having a "chronic" or constant cold.

Less well recognized is the occurrence of this type of hyperemia in any part of the nasopharyngeal mucosa, again in varying degree. Such swelling often produces a postnasal drip which, the patient will state, is present only when she is pregnant. Patients who do not have symptomatic congestion ordinarily, will find that when they do get a cold, the symptoms last much longer than those of a cold usually do. Occasionally, this hyperemia is responsible for closure of the medial end of the Eustachian tube; such patients will complain of "plugging" of the ears. Inspection of the ear drum will show a depression which confirms the presence of Eustachian closure rather than wax in the canal which is the patient's diagnosis. Symptoms related to this physiological congestion are more apt to occur in heavier smokers or those who have a history of allergic rhinitis, just as are the symptoms of the common cold. And when the cold does occur in pregnancy, the symptoms are worse because of the underlying congestion.

The pregnant woman with a cold is miserable for other reasons, dependent somewhat on her parity and the length of her gestation. As parity increases, so also does the relaxation of the abdominal and perineal musculature. The uterus, lying against a slack abdominal wall, and bearing down on relaxed perineal muscles, acts like a piston when the patient coughs, sneezes, or even blows her nose, pushing down on the bladder. Stress incontinence during colds is almost the rule.

As the length of gestation increases, so does the size of the uterus. As it grows, it pushes the abdominal contents above it and elevates the diaphragm. This results eventually in a lateral displacement of the lower rib cage, often to a point at which the patient will complain of soreness in this area. If such a

(Concluded on following page)

From a continuing study on nasal congestion...

timed to work while your patient does

A study begun in 1966 by the Department of Otolaryngology, Greater Baltimore Medical Center, has accumulated evidence that documents the effectiveness of Triaminic's timed-release action in the treatment of nasal congestion.

With its balanced formulation of an oral nasal decongestant and two antihistamines, Triaminic effected partial or complete relief in more than 82% of the 85 subjects treated. Clearing nasal obstruction. Reducing turbinate swelling. Making breathing easier.

It's a comforting thing to know that Triaminic really works.

Triaminic® *timed-release tablets*

Each timed-release tablet contains:

Phenylpropanolamine hydrochloride	50mg.
Pyrilamine maleate	25mg.
Pheniramine maleate	25mg.

Side effects: Occasional drowsiness, blurred vision, cardiac palpitations, flushing, dizziness, nervousness or gastrointestinal upsets. Precautions: The patient should be advised not to drive a car or operate dangerous machinery if drowsiness occurs. Use with caution in patients with hypertension, heart disease, diabetes or thyrotoxicosis.

(Advertisement)

patient has a cold, the coughing and sneezing will exaggerate this soreness. The diaphragmatic restriction caused by the enlarging uterus also makes breathing more difficult, particularly when the patient lies down. A cold compounds this difficulty.

Treating a cold in pregnancy requires two additional considerations. The patient should be told that the symptoms may last longer lest she become discouraged, and she should be reassured that the treatment will not damage the fetus. Although there are still some women who seem blissfully ignorant regarding matters of health (and these need to be cautioned not to take medication recommended by friends), most of our maternity patients are aware of the thalidomide tragedy. These women need constant reassurance that the symptoms of a cold can be treated, and that the medication is safe. Fortunately, many of the drugs which are of benefit have been in use long enough and widely enough so that such a statement can be offered. Occasionally one encounters a patient who is so anxious to avoid medication that she is extremely reluctant to take anything at all. Since cold is self-limited, it seems reasonable enough to give such a patient the choice and not to force drugs on her if she is obviously afraid of taking them.

The most distressing symptom of the common cold is the nasal congestion. This can be mitigated by the use of a decongestant which will help reduce the postnasal drip and the coughing caused by it. The kind of a cough which is described as a "tickling" in the throat and which is apt to occur when the patient goes to bed is usually due to nasopharyngeal congestion rather than inflammation in the lower respiratory tract.

There are many cough mixtures available. Most contain an antihistamine, a decongestant, and a cough "suppressant." Should cough suppression be desirable, it is important to remember not to use both a decongestant tablet and such a cough mixture as the patient would be getting a double dose of the decongestant. With some patients, the placebo effect of a cough syrup may be important and a liquid preparation might be substituted for an oral tablet.

For a sore throat, candy drops or lozenges at frequent intervals are soothing. It is not only unnecessary but unwise to use antibiotic lozenges or drops. The use of antibiotics in an uncomplicated cold is contraindicated and should be scrupulously avoided.

In summary, a cold in pregnancy is more severe and longer lasting. The treatment of the symptoms with local and systemic decongestants will make the patient more comfortable.

Apparently the cold is so common in pregnancy that it has received very little attention in the literature. References are almost non-existent and the few which are available add little to the common knowledge, are out-dated, or are not helpful. Thus the usual bibliography is not appended.

Relieve his sniffles,
her concern, and about
half your phone calls.
Tell her to get
"The Orange Medicine"

Triaminic® syrup

Each teaspoonful (5 ml.) contains:
Phenylpropanolamine hydrochloride ..... 12.5 r
Pheniramine maleate ..... 6.25 r

Folklore and Facts about Employees with Alcoholism—Part II

LEWIS F. PRESNALL
New York, N. Y.

(*Continued from December, 1967*)

Identification of the Scope of the Problem

The folklore of social stigma has described the alcoholic in terms of certain stereotypes. "Hopeless drunk," "no-good bum," and "weakling" are typical of these stereotypes. Obviously, no company can operate efficiently if its payroll is loaded with people who can be described in these terms. With only these pictures in mind, members of management have been entirely accurate in saying, "We don't have a problem with alcoholism in our company."

Folklore has also pictured alcoholism as a disgrace, and the alcoholic as having a defective-character condition which he could correct if he would only exercise his will power and drink in a controlled manner, "like all the rest of us responsible members of society."

Because of these folk beliefs in our culture, members of management have, until recently, felt that if they took constructive action regarding employees with alcoholism this action would reflect upon the company and the quality of personnel on the payroll.

The facts, however, are quite different from the folklore: Alcoholism is a widespread disease in our society; it affects approximately 1 out of 12 people who consume alcohol. No group of employees and no occupation in our culture is free from this illness. It is also a fact that only about 3% of the total number of people suffering from alcoholism in the United States are to be found in the "skid-row" population which usually contains the people who are in the late stages of alcoholism. The other 97% are found mostly in homes, offices, and factories. Their families are still intact, their health is not irreparably damaged, and they have regular jobs.

Therefore, when we refer to alcoholism in industry, we are talking about early- and middle-stage cases. Many of these workers with alcoholism still have drinking patterns that appear to the casual observer to be identical with the patterns commonly followed in our society by social drinkers. In fact, the social-drinking society provides alcoholics with a ready camouflage into which they can blend to avoid the penalties that social stigma inflicts upon them.

The frequency of alcoholism among employed groups has been found to vary from 1 to 8% of the total plant population. These figures are based upon case-finding in plants having effective alcoholism programs. The principal factors in this variation are the male/female ratio of employees, and the average age.

In old-line heavy industries, where the average age is relatively high—e.g., 42 years—and where less than 5% of the employees are female, one can normally expect to find that a minimum of 6-8% of the total employee population suffers from alcoholism in one of its stages. On the other hand,

Reprinted from JOURNAL OF OCCUPATIONAL MEDICINE, Vol. 9, No. 4, April 1967. With the permission of both author and publisher.

in a mercantile establishment—where perhaps 70% of the employees are female and the average age is around 35—the alcoholism frequency may run as low as 1%.

The picture of the "hopeless drunk" is also a part of unrealistic folklore. It is true that the recovery rates among advanced-stage alcoholics, commonly found among the older unemployed population, is extremely low. However, the prognosis is usually the same for any illness which has progressed without treatment over a period of 15-25 years.

On the other hand, the rate of recovery effected through alcoholism programs in industry has been between 50 and 70% of the cases treated. There are good reasons for this high rate: strong motivational tools are available in industry and we are dealing with less-advanced cases. Recovery, as the word is used by companies, does not necessarily mean that the employee has been continuously sober without interruption since he started treatment. Neither does it imply that patients have necessarily been transformed into models of emotional maturity in all instances. Relapse is common in this illness, as in some others. A high percentage of the patients treated will never return to drinking, but there are those who may have one or more relapses. Recovery, from the standpoint of the employer, means that the alcoholism has been sufficiently arrested, and even with an occasional relapse, the employee's work and attendance are not seriously affected. Companies are primarily interested in the general good health, the work performance, and regular attendance of employees. If these criteria are maintained at a respectable level, the employee is considered to be recovered as far as the company is concerned.

Unions are also interested in achieving a state of rehabilitation among alcoholics—the point at which the employee's work is satisfactory to the company and where union officials are not constantly put to the trouble of having to defend him against grievance and arbitration hearings where job security is at stake.

Company Policy

The discovery that all companies without formal programs have a policy regarding alcoholism comes as a surprise to many managers. It is an unwritten policy, but it is well understood by everyone who works in the company, including those individuals who suffer from alcoholism. This unwritten policy is created by the folklore of social stigma which everyone brings into the plant as a part of his preformed beliefs. If this policy were written in the usual company language it might read as follows:

> The company will pay an economic premium to employees for the successful concealment of alcoholism from the attention of management. This economic premium will be paid in terms of job security, promotion opportunities and fringe benefits. When the employee's alcoholism reaches the stage when it can no longer be concealed from the attention of management, his services with the company will be terminated.

It is impossible for a manager to state objectively that he has little alcoholism in his company as long as this unwritten policy exists. The economic and social rewards an employee with alcoholism receives for concealing early symptoms are enormous. The real reasons for absenteeism and poor or irregular work performance are disguised under alibis and diagnoses such as gastritis, upper respiratory infection, family troubles, and work pressures. If the person with alcoholism happens to be a salaried or executive employee, the economic rewards are proportionately greater and his ingenuity in concealing the problem from management's attention will be even more inventive. These factors prevent top management from receiving solid facts about the extent of alcoholism in the work force.

The only way that a company can remove or reverse this expensive and ridiculous effect of folklore is to deliberately establish constructive policies based upon facts. These policies then need to be implemented through sound procedures integrated with the company's existing personnel practices and health programs. Supervisors must be informed of the policy, instructed in the use of the procedures, and told how they may use the company's staff services in solving behavioral problems.

There is a tremendous potential advantage in industry. The problem can be converted into opportunity. Re-education and action can move in parallel lines. It is not necessary to wait until the emotional attitudes toward alcoholism of each supervisor and employee have been brought into line with scientific facts. At the community level,

this process may take 10, 20, or 30 years. With employee groups, however, this schedule need not delay action. Management has the power to establish policies and insist upon implementation through specific procedures. A company has only to take constructive action to induce supervisors to follow the procedures. Installation of any new program meets some resistance, but action does not require that the supervisor immediately change all his personal attitudes or prejudices.

For instance, if a company is installing a new cost-control and budgetary program, it is not necessary to educate every supervisor to be a careful manager of his own personal finances, nor to get him into the habit of balancing his own checkbook. The company simply describes certain procedures that must be followed. If the supervisor wishes to continue working for the company and he entertains hopes of promotion, he must follow the sound financial procedures that are explained to him by the company.

Doing something about alcoholism in a company is no different in this respect. Standard procedures are carefully tailored to fit the organization and the usual methods of management control are used. Unfortunately, the folklore on this subject has clouded our thinking and convinced many people that alcoholism is something quite different from other problems that yield to sound action and effective control procedures. If a company's disciplinary program is not corrective, it will not motivate anyone to change, including alcoholics. If normal communication channels are blocked, information about a company's alcoholism policy will fail to reach front-line supervisors in an effective manner.

Introduction of an alcoholism program which fails to work does not specifically indicate that alcoholism and alcoholics are hard to handle. It does show that the company's organization is not nearly as efficient as management had supposed it to be and this, in turn, indicates that a management problem exists. It must be dealt with before the company can deal effectively with anything, including alcoholism.

The Role of Labor Unions

Management is not the only group whose policies and procedures are dictated by folklore. Labor unions are also caught in the same trap of society's prejudices. Folklore makes it socially desirable for labor unions to respond politically, rather than humanely, toward union members having alcoholism. Labor representatives are put in a position where they must adopt the attitude of defending the employee's job security without giving any major attention to his future health or longevity.

In companies not having modern effective alcoholism programs, union representatives are not usually involved until the point is reached in the illness where job security is the primary issue. Even within some companies which claim to have alcoholism programs, we often find that union representatives are not invited to participate on the helping team until late in the disciplinary procedure. Corrective discipline is not applied because an employee has alcoholism, but because work performance or attendance is unsatisfactory. Often, no attempt has been made on the part of the employer or the union representative to get together at the first step of the disciplinary procedure where warning was given and an early attempt could have been made to motivate the employee toward diagnosis and treatment.

The unwritten procedures dictated by folklore actually put the immediate supervisor and the union representative into the same ambiguous position. In effect, they are helping to "kill the alcoholic with kindness" by postponement of action that combines firmness and understanding.

Employees with alcoholism are no less of a problem to union representatives than they are to management. Unions find that they can serve their own self-interest best when management and labor work together in identification of possible alcoholism in its early stages and in applying social pressure in such a way as to motivate the employee to seek help. Unions can also play an important part in the formal and informal educational process by which the cloud of folklore is dispelled and replaced with scientific facts in the minds of employees.

Procedures of Supervisors

The supervisors in a company that does not have a formal alcoholism program are in an awkward position. They are usually the first individuals, other than the employee's family, to recognize the early effects of alcoholism on behavior. They would like to do something about the situation, not only for humane reasons, but also be-

cause they recognize the enormous work problems and supervisory problems that result from alcoholism. In many cases, however, because of the misconceptions due to folklore, they do not recognize that alcoholism may be at the root of all the trouble the employee's behavior is causing on the job. At the same time, the supervisor often knows the employee personally. He hesitates to speak with him about a problem that folklore encourages him to believe is "personal." The supervisor often attempts to correct the condition when he is irritated and angry. He may make half-hearted attempts to apply standard disciplinary procedures. In the periods between these abortive attempts, the supervisor talks to the employee in a moralistic tone. The employee has encountered such moralizing so often from his spouse and friends that he is an expert at controlling the interview. The supervisor's efforts will produce no results and, as the illness progresses, the employee's record may show that the supervisor has given him 10 or 15 "last chances" before actual discharge.

Part of the supervisor's ambivalence is caused by the fact that management does not feel that alcoholism is a serious problem in the company. If a supervisor has 2 or 3 suspected alcoholics in his work group, he may be afraid that if this comes to the attention of management, it will reflect upon his competence as a supervisor. Furthermore, the company has not really given him any guidelines as to proper procedures when he encounters this sort of situation.

Many supervisors think that if they are to do anything constructive about an alcoholic, they will be asked to talk to the employee about his drinking problem. This they hesitate to do because it seems an invasion of an employee's private life. Unless the employee is intoxicated or drinking on the job, the supervisor is reluctant to bring up the subject.

Now, in contrast to the effects of this folklore, the facts are quite different. An effective program on alcoholism does not require the supervisor to discuss drinking behavior with employees. The supervisor's responsibility is job performance, attendance, and, if necessary, the administration of standard disciplinary procedures. He will have no occasion to discuss drinking behavior with an employee unless it occurs on the job. The supervisor is not a doctor, neither should he be cast in the role of amateur diagnostician. He sees certain behavior on the part of an employee, but he does not know that the employee has alcoholism. It is not his business to know this. This is the province of the medical profession, which, alone, is qualified to diagnose an illness.

Any supervisor, whether he works for a company with an alcoholism program or not, is asking for serious difficulty if he permits himself to get into a discussion with an employee about whether he has a drinking problem.

If the employee is suffering from alcoholism, which is a progressive illness, he has had many years of experience in winning arguments on this subject. All of the skills that the alcoholic has developed through the years in winning these arguments will be directed against the supervisor and nothing will be accomplished in the way of helping the employee. Society, steeped in its folklore, leads the person with alcoholism to privately suspect that he is either insane or morally delinquent if he continues to drink as he does. Suppose he is a well-dressed, successful executive. Not for a minute will he accept society's erroneous opinion of him without a struggle. His alibi system is his only protection of self-esteem. If alcoholics were regarded as sick people, they would not need to behave in a manner that looks unintelligent to the rest of us.

In the 4 major points briefly covered here, treatment has not been mentioned, for 2 reasons. First, a good deal is known about effective treatment of alcoholism. Alcoholics Anonymous remains the most effective single bulwark with its form of therapy, but there are other methods. Anyone who is interested can readily inform himself on this subject by reading, attending one of the many Summer Schools of Alcohol Studies, through NCA's affiliatel councils in many cities, or through contact with professionals familiar with treatment processes.

Second, the purpose of a company program for employees with alcoholism is to remove the effects of social stigma. Once this is done, early cases are identified and properly motivated to treatment. At this point, the company's job is largely done, and the employee can then be referred to outside community agencies for assistance in rehabilitation. Follow-up after the employee returns to work will, of course, be part of the company program. Many company and union programs

have failed because they did not give adequate attention to the in-plant aspects of the program that I have been describing. In other words, everything in the company programs may be best understood as belonging to a pretreatment phase.

There is no such thing as an ideal company program. Each program must be tailored to fit the organizational structure of the company. One of the more certain ways to guarantee failure in this field is for a company to borrow the alcoholism-program pattern used successfully in another situation and try to adapt it with minor modifications to their own company.

A good analogy that may describe why this approach fails is to use the example of a doctor-patient relationship. Suppose one went to his physician and said, "Doctor, I am sick." Then suppose that without taking a case history or examining the patient, the physician took a bottle of medicine off the shelf and said, "Take some of this. I tried it on the last patient and it works fine." A doctor who works in this fashion, we call a "quack." The analogy is exact for alcoholism programs that are taken from the shelf of some other company's success and applied indiscriminately to another situation. Some companies may succeed this way, but the mortality rate of such programs is very high.

Conclusion

It should be emphasized that the problem in taking action with company programs is not the alcoholic himself, but the effect of the social stigma and current folklore upon company policies, procedures, customs, and attitudes. We know how to treat alcoholism, but we have often neglected the task of dealing with the effects of erroneous folklore. This is why NCA has a new professional consultation service designed to help employers tailor programs to their organizational needs.

If an organization takes appropriate steps to remove the effects of folklore, the problems of early identification and motivation of employees to accept help will be solved with greater frequency. Patients can then be referred effectively to local treatment resources.

By following this course of action, the general supervisory competence within the plant will be greatly improved regarding all types of personnel problems. An added fringe benefit resulting from a good alcoholism program is that many of the behavioral problems that cause so much trouble to industry, including such things as psychoneurosis, family problems, incipient psychosis, and even narcotic addiction will be diagnosed earlier and handled in such a way that the vitality and productivity of employees will be conserved.

Mr. Presnall is Director of Industrial Services, National Council on Alcoholism.

Sustained circulatory, respirator and cerebral stimulation for th

(fewer absent doses by absent-minded patients)

Human volunteer subjects were administered Geroniazol TT tablets with the nicotinic acid component made radioactive with C-14. Plasma and urine samples were analyzed. (See Figures I and II) The radioactive tracer study substantiated the previous clinical evidence that the release of nicotinic acid from the Geroniazol TT tablet produced a gradual rise in plasma levels to a plateau for a total of 12 hours and more.

Such proven sustained activity makes the management of geriatric patients much easier by minimizing the possibility of neglected doses through absent-mindedness or senile confusion. Therapy *can* be con tinuous on a daily dose of only one Geroniazol TT tab let every 12 hours.

The gradual release of nicotinic acid in Geroniazo TT will provide the well-known peripheral vasodilata tion needed in patients with deficient circulation an with a minimum amount (if any) of "flushing." Alsc cerebrovascular circulation is complemented by per tylenetetrazol, long-established as a cerebral and res piratory stimulant.

Geroniazol TT improves the typical, unfortunat signs of senile confusion. Patients become more aler

ged and debilitated

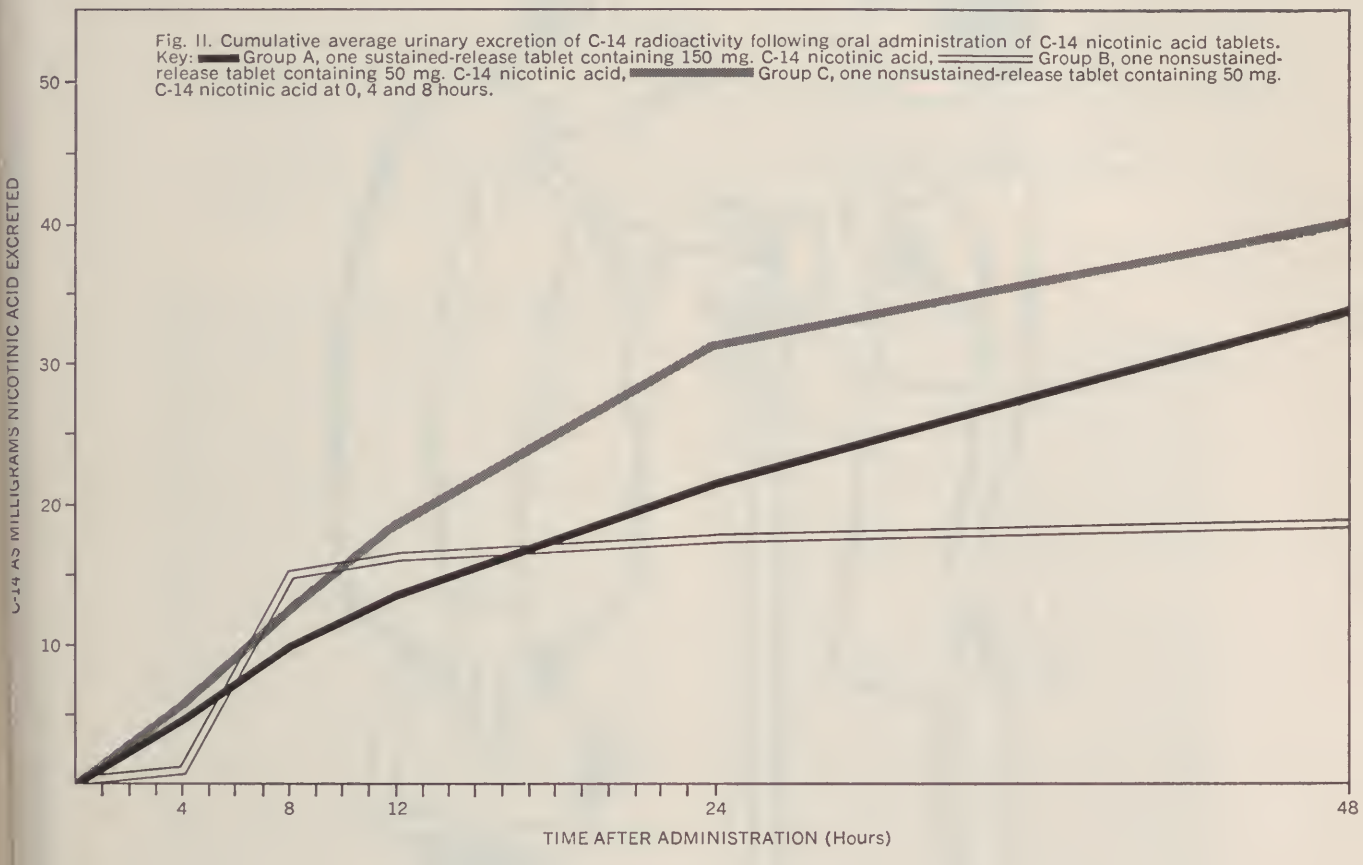

Fig. II. Cumulative average urinary excretion of C-14 radioactivity following oral administration of C-14 nicotinic acid tablets. Key: ▬ Group A, one sustained-release tablet containing 150 mg. C-14 nicotinic acid, ═══ Group B, one nonsustained-release tablet containing 50 mg. C-14 nicotinic acid, ▬▬ Group C, one nonsustained-release tablet containing 50 mg. C-14 nicotinic acid at 0, 4 and 8 hours.

ess confused and moody. Personal care, memory, motional stability, social attention improve. Fatigue, pathy and irritability are reduced.

A prescription for 100 tablets of Geroniazol TT will ermit your patients to enjoy the benefits of time-rolonged nicotinic acid/pentylenetetrazol therapy, t an economical price. Dosage is only one tablet every 2 hours.

Contraindications: There are no known contraindications.

Precautions: Exercise caution when treating patients with a low convulsive threshold.

Side Effects: Side effects are rarely encountered, however due to the vasodilatation effect of nicotinic acid, transitory mild nausea, flushing, tingling and pruritus are possible.

Dosage: One tablet every 12 hours.

Supplied: Prescribe bottles of 100 tablets, to take advantage of recent price reduction.

nicotinic acid 150 mg., pentylenetetrazol 300 mg.
Tempotrol® Time Controlled Tablet

"Good girl! You're down seven pounds!"

Get them while they're easily reversible.

Obesity doesn't happen suddenly. This insidious process has its beginning—and the chances of reversing it are better—during the *first 10 to 15 pounds of weight gain.* When a new dietary pattern must be established, consider the adjunctive use of BAMADEX SEQUELS. Combining the proven *anorexigenic* action of d-amphetamine with the *tranquilizing* effect of meprobamate, BAMADEX SEQUELS controls appetite throughout the day, usually with a single capsule daily.

Contraindications: Dextro-amphetamine sulfate: In hyperexcitability and in agitated prepsychotic states. Previous allergic or idiosyncratic reactions to meprobamate.
Precautions: Use with caution in patients hypersensitive to sympathomimetic compounds, who have coronary or cardiovascular disease, or are severely hypertensive.

Dextro-amphetamine sulfate: Excessive use by unstable individuals may result in psychological dependence.

Meprobamate: Careful supervision of dose and amounts prescribed is advised, especially for patients with known propensity for taking excessive quantities of drugs. Excessive and prolonged use in susceptible persons, e.g. alcoholics, former addicts, and other severe psychoneurotics, has been reported to result in dependence on the drug. Where excessive dosage has continued for weeks or months, reduce dosage gradually. Sudden withdrawal may precipitate recurrence of preexisting symptoms such as anxiety, anorexia, or insomnia; or withdrawal reactions such as vomiting, ataxia, tremors, muscle twitching and, rarely, epileptiform seizures. Should meprobamate cause drowsiness or visual disturbances, reduce dosage and avoid operation of motor vehicles, machinery or other activity requiring alertness. Effects of excessive alcohol consumption may be increased by meprobamate. Appropriate caution is recommended with patients prone to excessive drinking. In patients prone to both petit and grand mal epilepsy meprobamate may precipitate grand mal attacks. Prescribe cautiously and in small quantities to patients with suicidal tendencies.
Side Effects: Overstimulation of the central nervous system, jitteriness and insomnia or drowsiness. Dextro-amphetamine sulfate: Insomnia, excitability, and increased motor activity are common and ordinarily mild side effects. Confusion, anxiety, aggressiveness, increased libido, and hallucinations have also been observed, especially in mentally ill patients. Rebound fatigue and depression may follow central stimulation. Other effects may include dry mouth, anorexia, nausea, vomiting, diarrhea, and increased cardiovascular reactivity.

Meprobamate: Drowsiness may occur and can be associated with ataxia; the symptom can usually be controlled by decreasing the dose, or by concomitant administration of central stimulants. Allergic or idiosyncratic reactions: maculopapular rash, acute nonthrombocytopenic purpura with petechiae, ecchymoses, peripheral edema and fever, transient leukopenia. A case of fatal bullous dermatitis, following administration of meprobamate and prednisolone, has been reported. Hypersensitivity has produced fever, fainting spells, angioneurotic edema, bronchial spasms, hypotensive crises (1 fatal case), anuria, stomatitis, proctitis (1 case), anaphylaxis, agranulocytosis and thrombocytopenic purpura, and a fatal instance of aplastic anemia, but only when other drugs known to elicit these conditions were given concomitantly. Fast EEG activity, usually after excessive dosage. Impairment of visual accommodation. Massive overdosage may produce drowsiness, lethargy, stupor, ataxia, coma, shock, vasomotor and respiratory collapse.

Bamadex® Sequels®

Dextro-amphetamine sulfate (15 mg.) with Meprobamate (300 mg.) Sustained Release Capsules

CONFERENCE ON NURSING

Chairman, Nursing Liaison Subcommittee
JOHN F. SCHAEFER, MD

Forty-eight State Societies sent representatives to this conference. I was privileged to attend and speak for the Medical and Chirurgical Faculty of Maryland.

The program called for discussion of methods to strengthen professional relationships between Medicine and Nursing, provided an opportunity for exchange of information between the state medical society representatives, and evaluated problems common to the nursing and the medical professions.

Eleanor C. Lambertsen, RN, EdD, Director of the Division of Nursing Education at Teacher's College, Columbia University, was principal speaker for the morning session. She emphasized that the profession has defined the educational requirements for nursing but has failed to see completely what needs to be done. She stated that the young modern RN is criticized for inability to perform all the nursing duties that the older graduate performed. Modern techniques and procedures greatly influence what the young nurse can do after her formal training, and this depends on the medical staff at the hospital in which she trains and what it does. As an example, catheterization frequently was done "in the old days" in the patients room—under modern techniques, Foley catheters are placed in position in Surgery, and the hall or ward nursing job is maintenance. Dr. Lambertsen cited a parallel between specialization in Pathology, with its many subspecialties; and Nursing, where the student is influenced to specialize eventually as a nurse anesthetist, a Public Health nurse, a psychiatric nurse, a nurse in pediatrics, cardiology, intensive care, etc.

Following Dr. Lambertsen's excellent talk, comments from the physician representatives reflected the emotional turmoil associated with the provision of hospital nursing service.
Examples:

1. The nurse now is much more theoretically trained. This is better for the patient. The cost of her undergraduate training however should not be reflected on the in-patient's bill.
2. The nursing professional and the American Nursing Association are not seeing eye to eye; the Chief Nurse is against the programs but cannot do anything except comply with them; the AMA should do more to control nursing education.
3. The Diploma School is in danger of destruction by the Associate Degree programs. This should not be. The Associate Degree and the Diploma programs should furnish the general nurse, the "Indians;" and the

Sponsored Conference: AMA Committee on Nursing, for State Medical Society's Liaison Committee with Nursing. October 6, 1967. AMA Headquarters, Chicago, Illinois.

four-year BS programs the "Chiefs." The BS degree program leads to nursing leadership, responsible independent position, and the ability to make sensitive decisions.

4. In New Hampshire, the State Medical Society and the Nursing Association requested and received approval by the state legislature for a nurse training subsidy of $600 plus tuition for the pursing schools, primarily to maintain the diploma school programs. This has accomplished its purpose, and has even led to an increase in applications for the BS program.

The afternoon session was devoted to illustrating how the Medical and Nursing professions can cooperate by delineating in specific areas the responsibilities of the registered nurse. The title of this session was "The Idaho Story," since Idaho is in the process of doing what the Faculty's Nurse Liaison Subcommittee already accomplished in 1965, with approval from the State Medical Society and the MNA. I was happy to be in a position to point this out to the assembly, and to offer constructive suggestions to Idaho for the implementation of its current endeavors.

We recommend **CAMP**

PENDULOUS ABDOMEN SUPPORTS

Specifically designed to balance the load of forward bulk in obese patients; affords relief of strain on muscles and ligaments of the back and feet in the ankle-joints, caused by weight-accented spinal curve, bowed head and rounded shoulders. These supports often improve circulation and digestive disturbances.

WHAT DOES GALVANIC SKIN RESISTANCE DEMONSTRATE ABOUT THE EFFECT OF VALIUM (diazepam)?

Galvanic skin resistance... one measure of the Valium (diazepam) effect in reducing the somatic response to acute stress[1,2]

The subjective value of Valium (diazepam) has been proved by many clinical and empirical evaluations. Now, also objective criteria such as used in other areas of scientific research have demonstrated the effectiveness of Valium (diazepam) in reducing certain somatic responses to acute stress.

Devised as a research tool in psychosomatic medicine, this interesting method records respiratory excursions, galvanic skin resistance, cardiac activity and finger pulse volume as physical responses to stress. These autonomic nervous system responses to a standardized stressor—a film dealing with life-threatening incidents—are continuously monitored on the polygraph.

This gives a graphic representation of changes which the body may undergo in reacting to stress. The application of modern statistical analysis to these graphs provides a yardstick by which the calming effect of Valium (diazepam) can be measured quantitatively.

Before prescribing, please consult complete product information, a summary of which follows:

Contraindications: Infants, patients with a history of convulsive disorders, glaucoma or known hypersensitivity to drug.

Warning: Not of value in the treatment of psychotic patients, and should not be employed in lieu of appropriate treatment.

Precautions: Limit dosage to smallest effective amount in elderly or debilitated patients (not more than 1 mg, one or two times daily initially) to preclude ataxia or oversedation, increasing gradually as needed or tolerated. As is true of all CNS-acting drugs, until correct maintenance dosage is established, advise patients against possibly hazardous procedures requiring complete mental alertness or physical coordination. Driving during therapy not recommended. In general, concurrent use with other psychotropic agents is not recommended. If such combination therapy is used, carefully consider individual pharmacologic effects—particularly with known compounds which may potentiate action of Valium (diazepam), such as phenothiazines, barbiturates, MAO inhibitors and other antidepressants. Advise patients against simultaneous ingestion of alcohol or other CNS depressants. Safe use in pregnancy not established. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Observe usual precautions in impaired renal or hepatic function. Periodic blood counts and liver function tests advisable in long-term use. Cease therapy gradually.

Side Effects: Side effects (usually dose-related) are fatigue, drowsiness and ataxia. Also reported: mild nausea, dizziness, blurred vision, diplopia, headache, incontinence, slurred speech, tremor and skin rash; paradoxical reactions (excitement, depression, stimulation, sleep disturbances, acute hyperexcited states, hallucinations); changes in EEG patterns during and after drug treatment. Abrupt cessation after prolonged overdosage may produce withdrawal symptoms (convulsions, tremor, abdominal and muscle cramps, vomiting, sweating) similar to those seen with barbiturates, meprobamate and chlordiazepoxide HCl.

Dosage—*Adults:* Mild to moderate psychoneurotic reactions, 2 to 5 mg b.i.d. or t.i.d.; severe psychoneurotic reactions, 5 to 10 mg t.i.d. or q.i.d.; alcoholism, 10 mg t.i.d. or q.i.d. in first 24 hours, then 5 mg t.i.d. or q.i.d. as needed; muscle spasm with cerebral palsy or athetosis, 2 to 10 mg t.i.d. or q.i.d. *Geriatric patients:* 1 or 2 mg/day initially, increase gradually as needed and tolerated. (See *Precautions*.)

Supplied: Valium® (diazepam) Tablets, 2 mg, 5 mg and 10 mg; bottles of 50 and 500.

INTERFERON:

A NEW LANCE FOR THE ARMORY?

Parallel with advances in vaccine development came indications that the anti-viral agent interferon may yet become a weapon in the armory of clinical medicine.

Interferon, discovered by English investigators in 1956, is a protein produced by cells in response to virus infection and to some non-viral substances which are capable of entering the cell. It appears to act upon other cells to stimulate production of a protein which inhibits virus replication.

Ever since the discovery of interferon medical scientists have been fascinated with the idea that a wide variety of viral diseases could be prevented if interferon production could be stimulated to high levels within the human body. Efforts to "harvest" interferon from animals for use in human beings proved of no value: interferon is species specific, meaning that interferon from one species does not stimulate anti-viral activity in any other species.

Among substances being investigated as a harmless means of stimulating interferon production are: 1. a double strand of ribonucleic acid (RNA) stripped from certain viruses, which appears to jog cells into interferon production without causing disease, and 2. an industrially-synthesized giant molecule called pyran.

Although interferon produced within the body is much more potent than that passively injected, medical scientists are continuing efforts to obtain satisfactory interferon production in cultures of human cells.

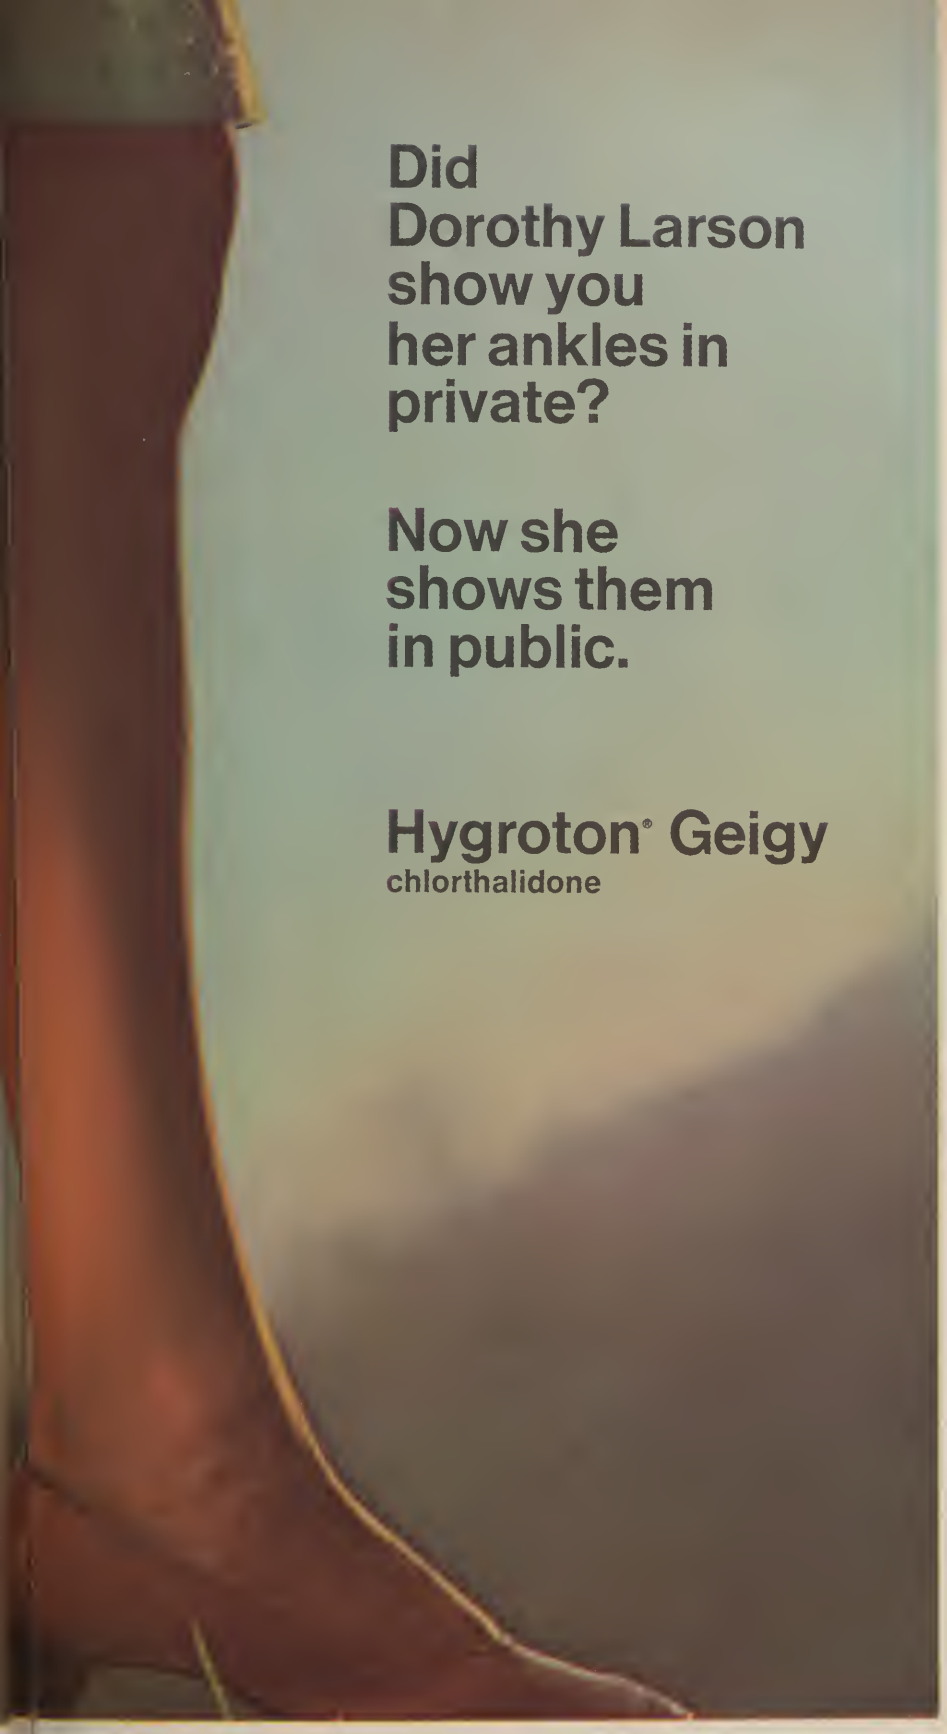
"Yes, Doctor, the pain is gone."

'EMPIRIN'® COMPOUND with CODEINE PHOSPHATE gr. 1/2 No. 3



Each tablet contains: Codeine Phosphate gr. ½ (Warning – May be habit forming), Phenacetin gr. 2½, Aspirin gr. 3½, Caffeine gr. ½.

■ Despite introduction of synthetic substitutes, efficacy of 'Empirin' Compound with Codeine remains unchallenged.

BURROUGHS WELLCOME & CO. (U.S.A.) INC., Tuckahoe, N.Y.

Indications: Hypertension and many types of edema involving retention of salt and water.
Contraindications: Hypersensitivity and most cases of severe renal or hepatic disease.
Warning: With the administration of enteric-coated potassium supplements, which should be used only when adequate dietary supplementation is not practical, the possibility of small bowel lesions (obstruction, hemorrhage, and perforation) should be kept in mind. Surgery for these lesions has frequently been required and deaths have occurred. Discontinue enteric-coated potassium supplements immediately if abdominal pain, distention, nausea, vomiting, or gastrointestinal bleeding occur. Use with caution in pregnant patients, since the drug may cross the placental barrier and adverse reactions which may occur in the adult (thrombocytopenia, hyperbilirubinemia, altered carbohydrate metabolism, etc.) are potential problems in the newborn.
Precautions: Antihypertensive therapy with Hygroton should always be initiated cautiously in postsympathectomy patients and in patients receiving ganglionic blocking agents or other potent antihypertensive drugs, or curare. Reduce dosage of concomitant antihypertensive agents by at least one-half. Barbiturates, narcotics or alcohol may potentiate hypotension. Because of the possibility of p sion of renal damage, perio determination of the BUN is cated. Discontinue if the BU or liver dysfunction is aggr Hepatic coma may be prec Electrolyte imbalance, sod or potassium depletion may If potassium depletion shou cur during therapy, Hygrot be discontinued and potass supplements given, provid

Did Dorothy Larson show you her ankles in private?

Now she shows them in public.

Hygroton® Geigy
chlorthalidone

Your office examination confirmed Mrs. Larson's ankle edema.

You prescribed Hygroton—to get rid of the edema.

And you found that Hygroton is not only effective; it frequently costs less than other equivalent therapy.

A nice way to treat the Mrs. Larsons in your practice.

Hygroton therapy may mean troublesome side effects for some patients. A summary of the prescribing information is shown below.

tie oes not have marked oli-
ria
ke ecial care in cirrhosis or
ver schemic heart disease and
pa nts receiving corticoste-
ds CTH, or digitalis. Salt re-
ict is not recommended.
ve **Reactions:** Nausea, gastric
ta , vomiting, anorexia, con-
pa and cramping, dizziness,
ak s, restlessness, hyperglyc-
m yperuricemia, headache,
isc ramps, orthostatic hypo-
tension, aplastic anemia, leukopenia, thrombocytopenia, agranulocytosis, impotence, dysuria, transient myopia, skin rashes, urticaria, purpura, necrotizing angiitis, acute gout, and pancreatitis when epigastric pain or unexplained G.I. symptoms develop after prolonged administration. Other reactions reported with this class of compounds include: jaundice, xanthopsia, paresthesia, and photosensitization.
Average Dosage: 50 or 100 mg. with breakfast daily or 100 mg. every other day.
Availability: White, single-scored tablets of 100 mg. and aqua tablets of 50 mg., in bottles of 100 and 1000.

The full ¼ grain of phenobarb in the formula

takes the nervous edge off the pain ...helps bring out the best in codeine

Phenaphen® with Codeine

the only leading compound analgesic that calms instead of caffeinates

Each capsule contains:

Phenobarbital (¼ gr.) ..... 16.2 mg.
(Warning: may be habit forming)
Aspirin (2½ gr.) .....162.0 mg.
Phenacetin (3 gr.) .....194.0 mg.
Hyoscyamine sulfate .....0.031 mg.
Codeine phosphate.....¼ gr. (No. 2), ½ gr. (No. 3), 1 gr. (No. 4)
(Warning: may be habit forming)

Contraindications: Hypersensitivity to any ingredient.

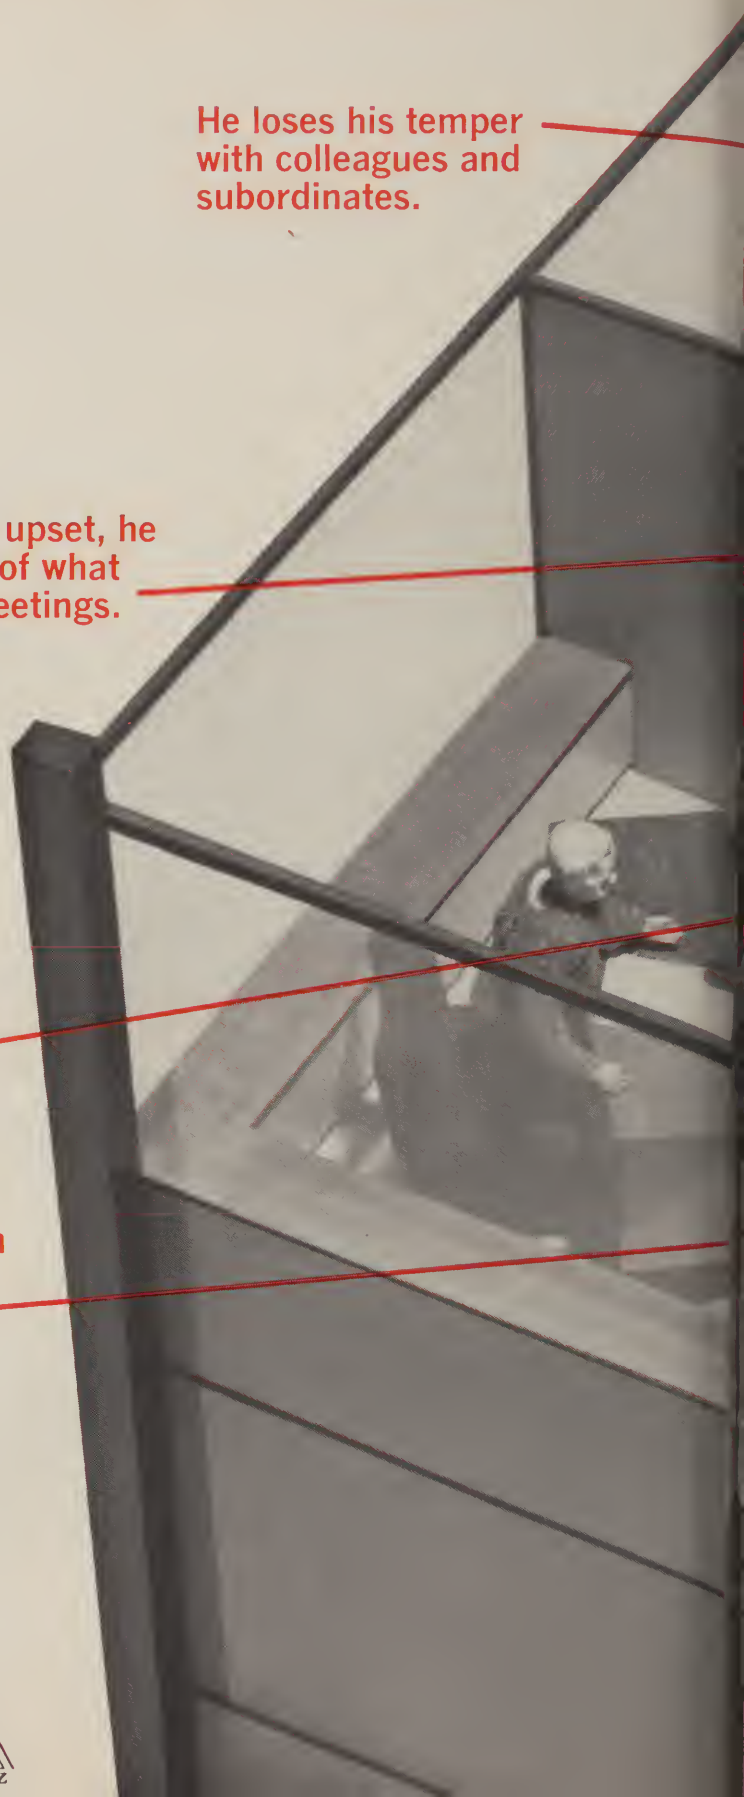
Precautions: As with all phenacetin-containing products, avoid excessive or prolonged use.

Side Effects: Side effects are uncommon—nausea, constipation, and drowsiness have been reported.

A-H-ROBINS

A. H. ROBINS CO., INC., Richmond, Va. 23220

When the agitated businessman goes to work...

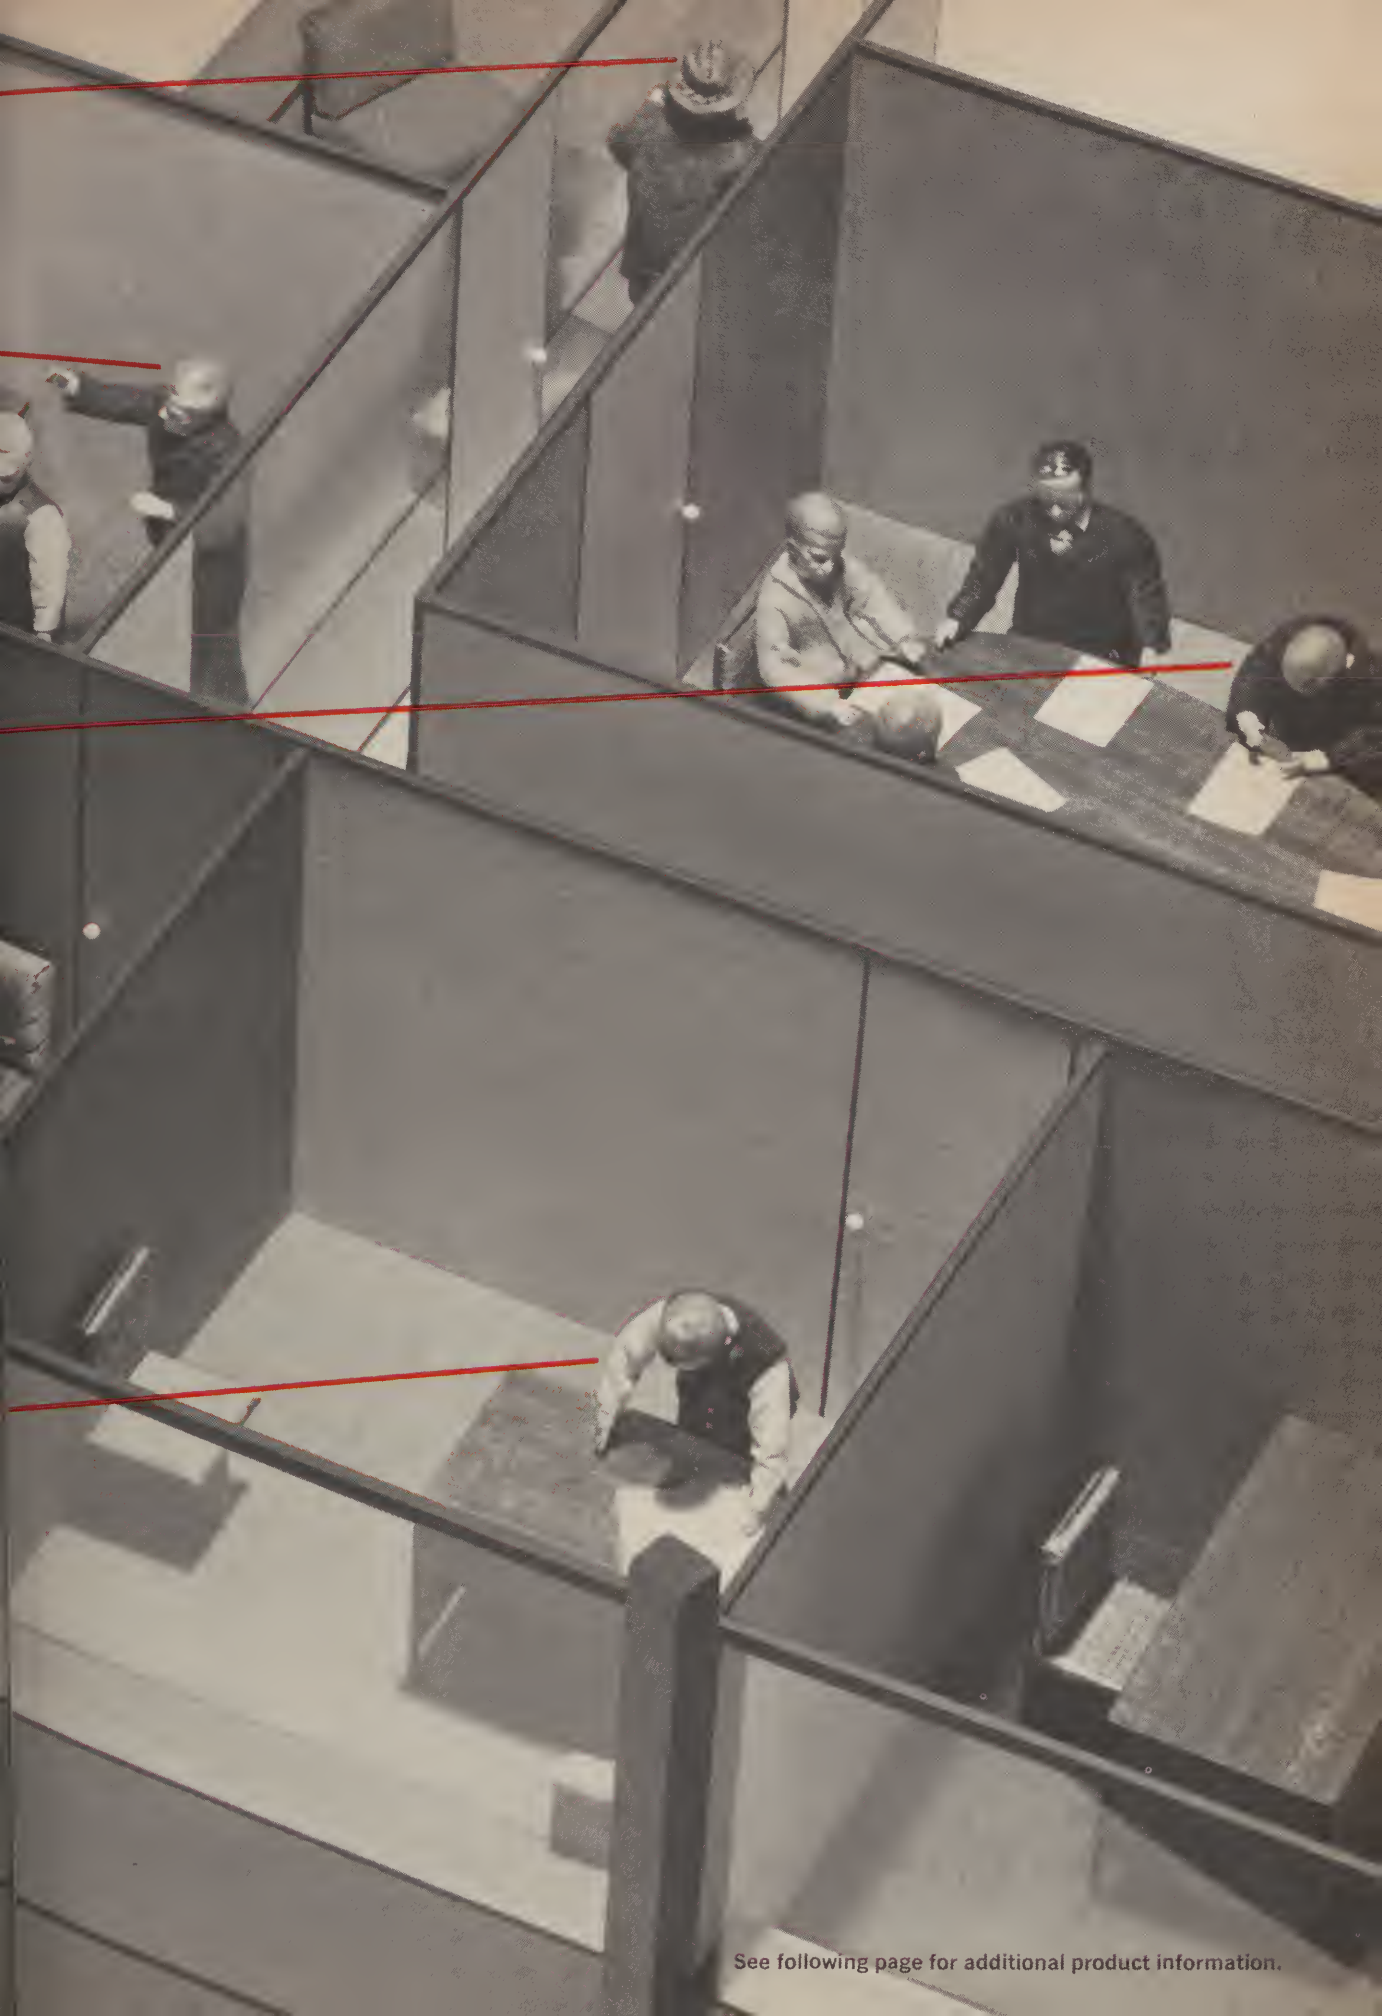


He goes home at night and takes it out on his family.

He loses his temper with colleagues and subordinates.

Emotionally upset, he misses half of what is said at meetings.

He is always fearful about his standing with the boss.



He just can't seem to settle down to his work.

for moderate to severe anxiety

Mellaril®
(thioridazine)
25 mg. t.i.d.

SANDOZ

See following page for additional product information.

When the agitated businessman goes to work...

Anxiety that *seriously interferes* with the individual's performance at work, at home, or in the community may be regarded as *moderate to severe* in degree.

Mellaril often recommends itself to the treatment of moderate to severe anxiety because it

- helps control the most frequent symptoms: marked tension, agitation, apprehension, restlessness, hypermotility
- often alleviates anxiety-induced somatic complaints
- frequently helps strengthen emotional resources
- helps the patient maintain realistic contact with environment, closer harmony with family

Thus, when you consider the anxiety moderate to severe...consider Mellaril.

Contraindications: Severely depressed or comatose states from any cause, and in association with or following MAO inhibitors; severe hypertensive or hypotensive heart disease.

Precautions: Hypersensitivity reactions (e.g., leukopenia, agranulocytosis) and convulsive seizures are infrequent. Pigmentary retinopathy has been observed where doses in excess of those recommended were used for long periods of time. May potentiate central nervous system depressants, atropine, and phosphorus insecticides. Where complete mental alertness is required, administer the drug cautiously and increase dosage gradually. In addition, orthostatic hypotension (especially in female patients) has been observed. Epinephrine should be avoided in treatment of drug-induced hypotension.

Side Effects: Pseudoparkinsonism and other extrapyramidal disorders are infrequent; drowsiness, especially in high doses early in treatment, may occur; nocturnal confusion, dryness of the mouth, nasal stuffiness, headache, peripheral edema, lactation, galactorrhea, and inhibition of ejaculation are noted on occasion; photosensitivity and other allergic skin reactions may occur but are extremely rare.

Before prescribing, see package insert for full product information.

for moderate to severe anxiety

mudrane®

for

- EMPHYSEMA
- ASTHMA
- CHRONIC BRONCHITIS
- BRONCHIECTASIS

The fast-disintegrating uncoated tablet gives relief in 15 minutes

Each tablet contains:

Potassium Iodide	195 mg.
Aminophylline	130 mg.
Phenobarbital, Caution: May be habit forming...	21 mg.
Ephedrine HCl	16 mg.

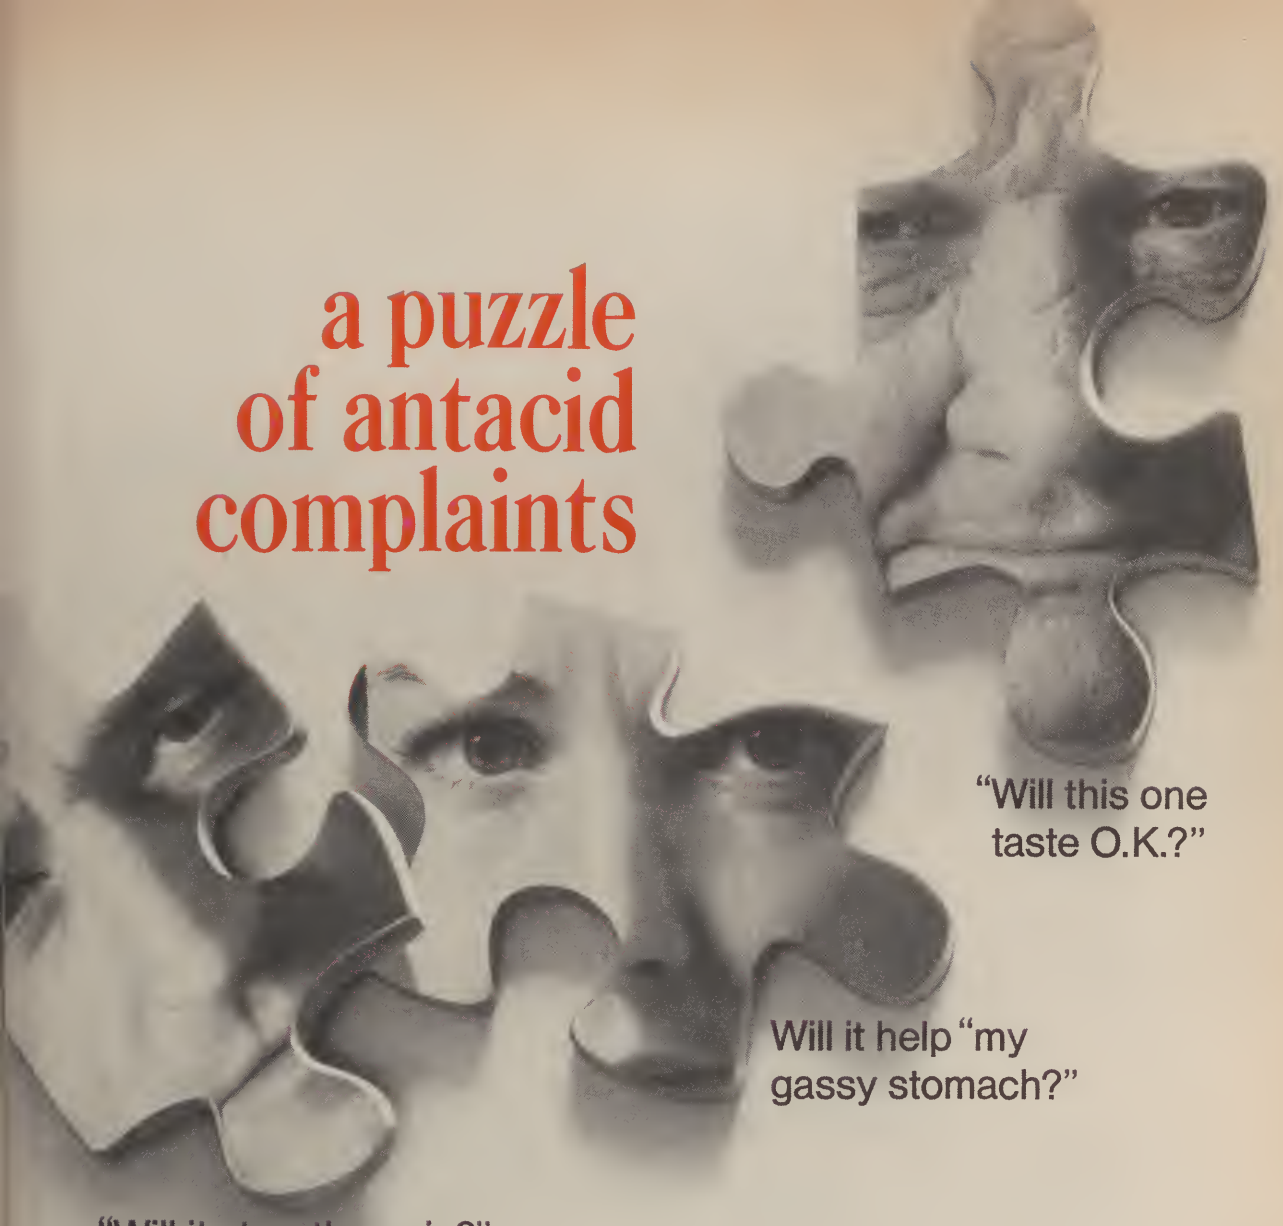
FEDERAL LAW PROHIBITS
DISPENSING WITHOUT PRESCRIPTION

Precautions: Usual for aminophylline-ephedrine-phenobarbital. Iodides may cause nausea, long use may cause goiter. Discontinue if symptoms of iodism develop.

Iodide contraindications: tuberculosis, pregnancy.

DOSAGE

One tablet, with full glass of water, 3 or 4 times daily.



Dispensed in bottles of 100 and 1000 tablets.

MUDRANE GG—Formula, dosage and package identical to Mudrane—*except*—100 mg. glyceryl guaiacolate replaces the potassium iodide. The value of Mudrane cannot be enjoyed by a small group in which K.I. is contraindicated. Mudrane GG is prepared for this group.

MUDRANE GG ELIXIR—Four 5 cc teaspoonfuls is equivalent to one Mudrane GG tablet. Dosage adjusted to age and weight of child. Mudrane GG Elixir is for pediatric patients and those who think they cannot swallow tablets. Dispensed in pint and half gallon bottles.

Stuart

Division/Pasadena, Calif.
ATLAS CHEMICAL INDUSTRIES, INC.

new evidence for TAO® (triacetyl-oleandomycin)

a macrolide antibiotic for the frequently seen respiratory infection in the office and for a problem pathogen* in the hospital.

*Staphylococcus aureus

study I[1]

Results of a 1967 in vitro—in vivo correlation study involving 116 patients with Gram-positive coccal infections in five institutions. All patients were given TAO prior to determining the susceptibility of the offending organism.

97.0%
of the organisms were susceptible to oleandomycin*

98.0%
of the patients responded favorably to TAO® (triacetyloleandomycin)

n some cases more than one pathogenic organism was solated from the patient.

study II[2]

Effect of oral therapy with TAO, erythromycin, and cloxacillin on the survival time of Rhesus monkeys after intravenous inoculations of lethal doses of staphylococci, phage type 80/81. (8 monkeys in each group)

conclusion:

*Under the conditions of this study and the doses employed, it was found that

TAO® (triacetyl-oleandomycin)

was far superior to erythromycin, as was cloxacillin, a bactericidal agent, and of particular interest, "...bacteriostatic triacetyloleandomycin was as effective or perhaps superior to cloxacillin in preventing lethal (staphylococcal, phage type 80/81) infection."

*It should be pointed out that results obtained in an experimental study of this nature may not necessarily be directly extrapolated to the clinical situation as it pertains to man.

O Rx Information

DICATIONS: Include streptococci, staphylococci, pneumococci and gonococci. Recommended for acute, severe infections ıere adequate sensitivity testing has demonstrated susceptibility to this antibiotic and resistance to less toxic agents. **)NTRAINDICATIONS AND PRECAUTIONS:** Not recommended for prophylaxis or in the treatment of infectious processes ıich may require more than ten days continuous therapy. In view of the possible hepatoxicity of this drug when therapy yond ten days proves necessary, other less toxic agents should be used. If clinical judgement dictates continuation of erapy for longer periods, serial monitoring of liver profile is recommended, and the drug should be discontinued at the st evidence of any form of liver abnormality. When treating gonorrhea in which lesions of primary or secondary syphilis e suspected, proper diagnostic procedures, including darkfield examinations, should be followed. In other cases in which ncomitant syphilis is suspected, monthly serological tests should be made for at least four months. Contraindicated in e-existing liver disease or dysfunction, and in individuals hypersensitive to the drug. Although reactions of an allergic ture are infrequent and seldom severe, those of the anaphylactoid type have occurred on rare occasions. When used in eptococcal infections, therapy should be continued for ten days to prevent the development of rheumatic fever or merulonephritis. The use of antibiotics may occasionally permit overgrowth of nonsusceptible organisms. A resistant ection or superinfection requires re-evaluation of the patient's therapy. In the event such occurs with this drug the dication should be discontinued, and specific antibacterial and supportive therapy instituted.

For your impatient cold patients

Two sprays from NTZ Nasal Spray—and nasal congestion, rhinorrhea, sneezing are reduced for *immediate* comfort for patients with colds.

NTZ is more than a simple vasoconstrictor. It contains:

Neo-Synephrine® (brand of phenylephrine) HCl 0.5 per cent, the major component, virtually synonymous with fast, efficient but gentle nasal vasoconstriction on contact.

Thenfadil® (brand of thenyldiamine) HCl 0.1 per cent, topical antihistamine for reduction of rhinorrhea, sneezing or itching. It combats the allergic reactions that may occur in colds or sinusitis.

Zephiran® (brand of benzalkonium, as chloride, refined) 1:5000, antiseptic preservative and wetting agent to promote penetration and spread of the formula.

NTZ is well tolerated. Used in a cold it may help prevent sinusitis by opening sinus ostia and permitting drainage. It may also be used in sinusitis to help establish drainage.

The spray is best used twice, the second a few minutes after the first, repeated every three or four hours as needed. NTZ is for temporary relief of nasal symptoms, and overdosage should be avoided.

Supplied: NTZ Nasal Spray, plastic squeeze bottles of 20 ml.; NTZ Nasal Solution, bottles of 30 ml. (1 fl. oz.) with dropper.

The Board of Directors of the Baltimore City Medical Society met at 1211 Cathedral St., Baltimore, Md., on December 12, 1967, at 4:30 P.M. The meeting was called to order by Harry J. Connolly MD, who welcomed the new members to the Board. These new members include John T. Chissell, MD, John N. Classen, MD, Edward F. Cotter, MD, Emmanuel A. Schimunek, MD, and Philip Franklin Wagley, MD. The minutes of the November 14th meeting were read and these were accepted as approved by the Board.

Edith Schoenrich, MD, and Miriam Van Gelder, MD, of the State Health Department presented problems related to the present nursing home situation in the State and the quality of

(*Continued on page* 127)

Indications: Tofrānil is recommended for the treatment of depressive states of diverse psychopathology.
Contraindications: The concomitant use of Tofrānil and monoamine oxidase inhibiting (M.A.O.I.) compounds is contraindicated. Hyperpyretic crises or severe convulsive seizures may occur. Potentiation of adverse effects can be serious or even fatal. An interval of at least 7 days after M.A.O.I. therapy has been discontinued should be allowed before Tofrānil may be substituted. Initial Tofrānil dosage should be low, increases should be gradual, and the patient's progress should be carefully observed.
Warning: Clinical reports have suggested that there may be a risk of teratogenesis associated with the use of this compound during the first trimester of pregnancy. Unless, in the opinion of the prescribing physician, the potential benefits outweigh the possible risks, Tofrānil should not be used during the first trimester of pregnancy.
Cardiovascular complications, including myocardial infarction and arrhythmias, have occasionally occurred in susceptible individuals. Patients with cardiovascular disease should be given the drug only under careful observation and in low dosage.
Precautions: Since suicide is always a possibility in severely depressed patients and one which may persist until significant remission occurs, such patients should be carefully supervised during early treatment with Tofrānil. Some severely depressed patients may also require hospitalization and/or concomitant electroconvulsive therapy.
Because of its anticholinergic effect, caution should be observed in prescribing Tofrānil for patients with increased intraocular pressure.
In rare instances, transient cardia arrhythmias have occurred in hyp thyroid patients and in patients re ceiving thyroid medication when Tofrānil was added to the regimen Imipramine may block the pharma cologic activity of guanethidine ar other related adrenergic neuron-blocking agents.
The drug is not recommended at t present time in patients under 12 of age.
Adverse Reactions: Dryness of the mouth, tachycardia, constipation, turbances of accommodation, swe ing, dizziness, weight gain, urinar frequency or retention, nausea an vomiting, peripheral neuritis, mild parkinson-like syndrome, tremors rare cases of falling in elderly pa-tients, confusional states (with su symptoms as hallucinations and d orientation), activation of psychos schizophrenics and agitation (inc

When a milestone in life is marred by depression...

Often in the mind of the lonely, widowed, depression-prone individual, she's not gaining a daughter...she's losing a son. The occasion may be marred by such symptoms of depression as feelings of sadness, incapacity, helplessness and hopelessness.

In about 3 out of 4 cases, Tofrānil relieves symptoms of primary depression.

As maintenance therapy in primary depressive illness, it helps prevent relapse.

Although toxic reactions severe enough to require discontinuation of Tofrānil are uncommon, in patients with cardiovascular disease, thyroid disorders, increased intraocular pressure, or in those receiving anticholinergics (including antiparkinsonism agents), the special precautions listed in the Prescribing Information should be carefully observed. The use of Tofrānil in patients receiving M.A.O.I.'s is contraindicated.

Tofrānil® imipramine hydrochloride Geigy

hypomanic and manic episodes)
ich may require dosage reduction
d/or addition of a tranquilizer or
nporary discontinuation of the drug,
leptiform seizures, orthostatic
potension and substantial blood
essure fall in hypertensive patients,
rpura, transient jaundice, bone mar-
v depression including agranulocy-
is, sensitization and skin rash
luding photosensitization, eosino-
lia, and mild withdrawal symptoms
sudden discontinuation after pro-
ged treatment with high doses.
casional hormonal effects (im-
ence, decreased libido, and estro-
ic effects) may be observed.
opine-like effects may be more
nounced (e.g. paralytic ileus) in
ceptible patients and in those
ng anticholinergic agents (includ-
antiparkinsonism drugs).
patient Adult Dosage: Initially,
ng. daily, increased, if necessary, to 150 or 200 mg. Maintenance dosage may be lower, 50 to 150 mg. daily, if possible.
Geriatric and Adolescent Dosage: Initially, 30 or 40 mg. daily, which may be increased according to response and tolerance. It is usually unnecessary to exceed 100 mg. daily.
A lag in therapeutic response, lasting from a few days to a few weeks, should be expected. When dosage recommendations are already being followed, increasing the dosage does not normally shorten this latency period and may increase the incidence of adverse reactions.
Availability: Tofrānil: Round tablets of 25 and 50 mg.; triangular tablets of 10 mg. for geriatric and adolescent use; and ampuls, each containing 25 mg. in 2 cc. for I.M. administration.

If hypothyroidism leaves your patient feeling like this...

consider

LETTER®

(SODIUM LEVOTHYROXINE, ARMOUR) TABLETS

Synthetic Thyroid Replacement Therapy

Letter® provides all the advantages of the synthetically pure chemical sodium levothyroxine. Dosage is precise and potency is consistently uniform.

and

Letter® is micronized to provide maximum opportunity for full absorption and clinical response.

In addition Letter® is distinctively color coded with an identifying number stamped on each tablet to provide accurate dosage control.

Indications: Hypothyroid conditions. **Contraindications:** Thyrotoxicosis, acute myocardial infarctions unless associated with hypothyroidism. In hypothyroidism with hypoadrenalism coadministration of corticoids with LETTER® is recommended. **Precautions and Side Effects:** Excessive dosage may result in diarrhea, cramps, palpitation, nervousness, rapid pulse, sweating. If symptoms appear, discontinue medication for several days, then reinstitute at a lower level. Since myxedema patients with heart disease may suffer seriously from abrupt increases in dosage, caution should be exercised in adjusting dosage. **Dosage:** Generally, the initial adult dosage is 0.1 mg. daily. This may be increased in small increments every one to three weeks until proper metabolic balance is achieved. **Available:** Bottles of 100 tablets, in six potencies: 0.025 mg. (violet), 0.05 mg. (peach), 0.1 mg. (pink), 0.2 mg. (green), 0.3 mg. (yellow), and 0.5 mg. (white).

COMPONENT MEDICAL SOCIETIES

(*Continued from page* 123)

patient care for our senior citizens. The Board of Directors welcomed the opportunity to share with the State Health Department problems relative to nursing home care. It was pointed out that the Baltimore City Medical Society's role in this program is especially important since half of the nursing homes in the State are located within the confines of Baltimore City. Dr. Schoenrich pointed out to the Board that presently there are some conspicuous deficits in the program as it now stands. First and foremost, is the insufficient number of facilities available for the care of the senior citizen. Secondly, at the present time there is no adult foster home care program available. In addition to these obvious deficits, the great disparity in the quality of care available in various nursing homes was pointed out. It is also obvious that nursing home facilities tend to deterioriate with the passage of time and that more rigid controls and didactic standards should be established. Presently, the Federal standards and those required by the State for liscensure are preventative checks for this deficit but are still inadequate. The present standards for licensing a nursing home closely parallel Federal standards set forth for Title 18 patients. Like many other aspects of patient care, one of the prime deficits seems to center about the insufficient numbers of personnel available to man such facilities. Dr. Wagley suggested it might be possible to use model nursing homes as training centers for personnel to be subsequently used elsewhere. Dr. Schoenrich pointed out that a privately sponsored "Association of Principal Nursing Home Physicians" has been established and it is this organization's intent to upgrade the standards of nursing home care. This group of physicians have already set forth a didactic list of high ideals felt necessary for the operation of nursing home facilities. This group of physicians has the approval of the Medical and Chirurgical Faculty. It was suggested by Dr. Connolly that the Baltimore City Medical Society contact John Collins Harvey, MD, chairman of the "Nursing Home Advisory Committee" and that he appoint a member of the Baltimore City Medical Society to serve on this important committee.

Nominees for the Faculty's Community Service Award was discussed, and each member was asked to give this problem serious consideration and make their recommendations known prior to the next Board meeting.

The Professional Relations Committee reviewed several cases brought to its attention. These were discussed in detail, were acted upon and disposed of in the appropriate manner. N. Floyd Adams, Jr., MD, a member of the Baltimore City Medical Society since 1931 and presently retiring from practice, was recommended for emeritus membership.

The Policy and Planning Committee recommendation to hold Baltimore Medical Society meetings in various city hospitals was approved. In the future, Baltimore City Medical Society meetings will be held in selected city hospitals, the reason being to help increase attendance at meetings and allow the membership to visit those hospital facilities available in the city.

Under new business, the Board unanimously endorsed the reappointment of Robert Farber, MD to another term as Health Commissioner. This recommendation will be forwarded to Mayor Thomas D'Alesandro III in the immediate future.

The meeting was adjourned at 6:15 P.M.

Frederick County Medical Society

The Frederick County Medical Society held its election of officers at the Hotel Frederick on December 19th, during the society's annual Christmas meeting. The following doctors were elected:

Dr. Rex R. Martin, President
Dr. Ernest Dettbarn, President-Elect
Dr. Fred Baker, Treasurer
Dr. A. A. Pearre, Jr., Secretary

The Baltimore Regional Red Cross Blood Program requires the services of a number of physicians (who are remunerated on a per-diem basis) to work with units in collecting blood.

The physician's duties are principally to make decisions on donor eligibility in doubtful cases.

In the past it has been found that doctors in semi-retirement have not only rendered invaluable service to this program, but have found the work interesting and satisfying.

Any interested physicians are requested to contact Dr. Nathan Racusin at 922-5595 for further particulars.

WARNINGS

The public health struggle with venereal disease is far from won, as became apparent this year when the U.S. Public Health Service announced that gonorrhea is more prevalent in the United States now than at any time in the last 20 years. The proportion of penicillin-resistant gonorrhea strains also is increasing.

One problem appears to be a relatively large reservoir of non-symptomatic and untreated gonorrhea in females.

Other factors presumably related to disease increase are: lessened fear of venereal disease in the era of penicillin and "quick cures"; increased mobility of the population, including gonorrhea contacts; and, poor reporting of the disease by embarrassed victims and their physicians.

Penicillin resistance has been steadily on the increase among gonorrhea strains found normally in the United States. Some new strains, including some which are penicillin resistant, have been introduced to the U.S. by servicemen returning from Viet Nam.

Extensive research is underway to develop a reliable blood test which would enable physicians to spot non-symptomatic "carriers."

The Public Health Service also warned that a significant outbreak of A2 influenza can be expected during the winter season. Immunization and a booster shot two months later was recommended for the chronically ill, especially those with cardiovascular, renal, and metabolic disorders, as well as for persons more than 65 years old and persons in institutions.

Perhaps there have been times when you wanted to prescribe erythromycin and triple sulfas for little patients. Now you can—with a choice of two new fine-tasting pediatric forms.

New–Two Pediatric Forms of Erythromycin and Triple Sulfas

ERYTHROCIN®-SULFAS Chewable (Erythromycin ethyl succinate-trisulfapyrimidines chewable tablet)

In clinical trials[1,2], this orange-flavored tablet was given to 55 patients, aged four months to 18 years.

Diagnoses (multiple in some cases) represented a cross section of bacterial infections commonly seen in pediatric office practice.

Therapy was given from three to 12 days, with an average of six days.

Of the 55 patients, 30 were reported cured within 72 hours, while 22 showed partial recovery within the same time, and subsequent clinical cure.

A clinical cure rate of 94.5%

ERYTHROCIN®-SULFAS Granules (Erythromycin ethyl succinate-trisulfapyrimidines granules for oral suspension)

87 patients were treated[1,2]—all children, ages four months to 15 years.

The diagnoses were multiple in some cases and were chiefly bacterial infections of the respiratory tract.

Dosage was maintained from three to 10 days; average treatment was five days. All of the ill children accepted the orange-flavored suspension favorably.

53 were clinically cured within 72 hours, while 32 showed partial relief within the same time, and subsequent clinical cure.

701358

A clinical cure rate of 97.7%

ABBOTT

Brief Summary on next page

ERYTHROCIN®-SULFAS
Brief Summary

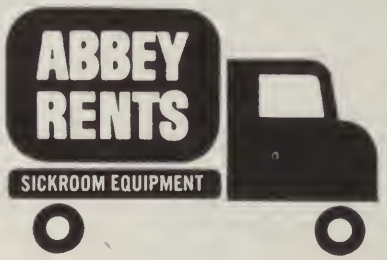
Contraindications: Known sensitivity to erythromycin or sulfonamides. Because of the possibility of kernicterus with sulfonamides, do not use in pregnancy at term, premature or newborn infants.

Warnings: As with other forms of sulfonamide therapy, carefully evaluate patients with liver or kidney damage, urinary obstruction, or blood dyscrasia. Deaths have been reported from hypersensitivity reactions and blood dyscrasias following use of sulfonamides. Perform blood counts and liver and kidney function tests if used repeatedly at close intervals or for long periods.

Precautions, Side Effects: Occasionally mild abdominal discomfort, nausea or vomiting may occur with erythromycin, generally controlled by reduction of dosage. Mild allergic reactions (such as urticaria and other skin rashes) may occur. Serious allergic reactions have been extremely infrequent. Use sulfonamides with caution in patients with a history of allergy. Assure adequate fluid intake to prevent crystalluria and institute alkali therapy if indicated. If overgrowth of nonsusceptible organisms occurs, withdraw the drug and institute appropriate treatment. If a patient should show signs of hypersensitivity, appropriate countermeasures (e.g. epinephrine, steriods, etc.) should be administered and the drug withdrawn.

Adverse Reactions: Sulfonamide therapy may be associated with headache, nausea, vomiting, urticaria, diarrhea, hepatitis, pancreatitis, blood dyscrasias, neuropathy, drug fever, skin rash, injection of the conjunctiva and sclera, petechiae, purpura, hematuria and crystalluria.

Side effects due to erythromycin are infrequent, but occasional abdominal discomfort, nausea, or vomiting, urticaria and other skin rashes may occur.



Supplied: The Granules for Oral Suspension come in bottles of 60 ml. and 150 ml. The Chewable tablets are in bottles of 50. Each 5-ml. teaspoonful of reconstituted Granules or each Chewable tablet provides erythromycin ethyl succinate equivalent to 125 mg. of erythromycin activity and 167 mg. of each of sulfadiazine, sulfamerazine and sulfamethazine.

The Science of Communication as practiced at Monumental Printing

It's more than a science: it's an Art, the precise transliteration in print of an intangible idea for a heterogeneous group of critical readers.

Here, at Monumental Printing, we learned to handle the tools of intelligent communication by the empirical method: working with them. The brush and palette of our art, the chisel, the score, the script are simply words on paper. We learned their proper use over 50 years of practice by being permitted to print such Journals as:

Clinical Chemistry
Digestive Diseases
Fertility & Sterility
Occupational Medicine
Leprosy
Mental Hospitals
Psychiatric Studies and Projects
Psychosomatic Medicine

We speak your language. We know the difference between edema and enema; syndrome and symptom; sewage and sewerage. And when and why we should use 12 point Caslon Bold instead of 10 Stymie.

If you, too, need a good printer, let's communicate!

Regroton®

chlorthalidone 50 mg., reserpine 0.25 mg.

Indications: Hypertension. **Contraindications:** History of mental depression, hypersensitivity, and most cases of severe renal or hepatic diseases. **Warning:** With the administration of enteric-coated potassium supplements, which should be used only when adequate dietary supplementation is not practical, the possibility of small-bowel lesions (obstruction, hemorrhage, and perforation) should be kept in mind. Surgery for these lesions has frequently been required and deaths have occurred. Discontinue coated potassium-containing formulations immediately if abdominal pain, distention, nausea, vomiting, or gastrointestinal bleeding occur. Discontinue one week before electroshock therapy, and if depression or peptic ulcer occurs. *Use in pregnancy:* Regroton should be used in pregnant patients or in women of childbearing potential only when, in the judgment of a physician, its use is deemed essential to the welfare of the patients; adverse reactions (thrombocytopenia, hyperbilirubinemia, altered carbohydrate metabolism, etc.) are potential problems in the newborn.
Precautions: Antihypertensive therapy with Regroton should always be initiated cautiously in postsympathectomy patients and in patients receiving ganglionic blocking agents, other potent antihypertensive drugs, or curare. Reduce dosage of concomitant antihypertensive agents by at least one-half. To avoid hypotension during surgery, discontinue Regroton therapy two weeks prior to elective surgical procedures. In emergency surgery, use, if needed, anticholinergic or adrenergic drugs or other supportive measures as indicated. Because of the possibility of progression of renal damage, periodic kidney function tests are indicated. Discontinue if the BUN rises or liver dysfunction is aggravated. Hepatic coma may be precipitated. Electrolyte imbalance, sodium and/or potassium depletion may occur. If potassium depletion should occur during therapy, Regroton should be discontinued and potassium supplements given, provided the patient does not have marked oliguria. Take particular care in cirrhosis or severe ischemic heart disease and in patients receiving corticosteroids, ACTH, or digitalis. Salt restriction is not recommended. Use cautiously in patients with ulcerative colitis or gallstones (biliary colic may be precipitated). Bronchial asthma may occur in susceptible patients. **Adverse Reactions:** The drug is generally well tolerated. The most frequent side effects are nausea, gastric irritation, vomiting, diarrhea, constipation, muscle cramps, headache, dizziness and acute gout. Other potential side effects include angina pectoris, anxiety, depression, bradycardia and ectopic cardiac rhythms (especially when used with digitalis), drowsiness, dull sensorium, hyperglycemia and glycosuria, hyperuricemia, lassitude, restlessness, transient myopia, impotence or dysuria, orthostatic hypotension which may be potentiated when chlorthalidone is combined with alcohol, barbiturates or narcotics, leukopenia, aplastic anemia, skin rashes, thrombocytopenia, agranulocytosis, nasal stuffiness, increased gastric secretions, nightmare, purpura, urticaria, ecchymosis, weakness, uveitis, optic atrophy and glaucoma, and pruritus. Eruptions and/or flushing of the skin, a reversible paralysis agitans-like syndrome, blurred vision, conjunctival injection, increased susceptibility to colds, dyspnea, weight gain, decreased libido, dryness of the mouth, deafness, anorexia, and pancreatitis when epigastric pain or unexplained G.I. symptoms develop after prolonged administration. Jaundice, xanthopsia, paresthesia, photosensitization and necrotizing angiitis are possible. **Average Dosage:** One tablet daily with breakfast. **Availability:** Pink, single-scored tablets in bottles of 100 and 1000. (B) 46-600-B

"Early in 1953 Davis and Grand undertook a review of well established practices connected with the treatment of T. vaginalis infections. For instance, it had been accepted that an acid douche should be employed. This was based on cultural studies showing that when the pH was below 5 the organisms would die. They found that the commonly used vinegar douche with a pH of 3 showed no visible effect on T. vaginalis under the microscope in 15 minutes. Both citric and lactic acid were tested with similar results. Davis then recalled that in his early treatment of T. Vaginalis infections over 30 years ago he had had his first successes with alkaline preparations, and when he returned to their use the patients reported them more soothing than the previously used acid solutions."

(Am. J. Obst. & Gynec., 68:559, 1954)

Criteria for Cleansing Douche

"Daily douching often is a part of the treatment administered in dealing with T. vaginalis and since it is possible that the solution might contain agents that could hamper the regrowth of Doederlein bacillus, the following properties were said to be ideal.

1. It should contain a harmless, nonsensitizing detergent to remove mucous deposits and debris.
2. It should not contain any antibacterial agents, since the contact possible during douching would be so fleeting that anti-bacterial action could not be expected.
3. It should be acid in pH.

The 3rd property seems to be the most illogical and unimportant. If contact is so fleeting that antibacterial actions could not be expected, it would seem to follow that its acid quality would be of no consequence. Furthermore, acid solutions are irritating to the mucosa and oftentimes accentuate inflammation.

Actually, the value of a douche is generally conceded to be confined to its use as a cleansing and deodorizing agent. The encouraging results achieved with a detergent douche solution in treating infections of the vagina are probably attributable to the enormous normal recuperative powers of the vaginal tissues which have been under-estimated as a factor in the restoration of normal physiology.

Therefore, simple cleansing of the vagina with a non-irritating, mildly alkaline douche which is soothing to the vaginal mucosa and which penetrates and flushes out the dead organisms, debris and mucinous materials frequently enables the physiological processes to overcome the infection."

Charles B. Marek, M.D., Chief of Gynecology; Bon Secours Hospital: personal communications August 11, 1964

Eastern Research Laboratories, Inc. • 302 S. Central Ave. • Baltimore, Md. 21202

the "Librium® effect"
(chlordiazepoxide HCl)

For years, physicians have valued Librium (chlordiazepoxide HCl) capsules for their reliable calming effect.

(in capsules)

Now, the same dependable antianxiety effect can be obtained with convenient tablets—Libritabs (chlordiazepoxide).

(in Libritabs™)
(chlordiazepoxide)

Before prescribing, please consult complete product information, a summary of which follows:

Contraindications: Patients with known hypersensitivity to the drug.

Warnings: Caution patients about possible combined effects with alcohol and other CNS depressants. As with all CNS-acting drugs, caution patients against hazardous occupations requiring complete mental alertness (*e.g.*, operating machinery, driving). Though physical and psychological dependence have rarely been reported on recommended doses, use caution in administering to addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions), following discontinuation of the drug and similar to those seen with barbiturates, have been reported. Use of any drug in pregnancy, lactation, or in women of childbearing age requires that its potential benefits be weighed against its possible hazards.

Precautions: In the elderly and debilitated, and in children over six, limit to smallest effective dosage (initially 10 mg or less per day) to preclude ataxia or oversedation, increasing gradually as needed and tolerated. Not recommended in children under six. Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects, particularly in use of potentiating drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions (*e.g.*, excitement, stimulation and acute rage) have been reported in psychiatric patients and hyperactive aggressive children. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship has not been established clinically.

Adverse Reactions: Drowsiness, ataxia and confusion may occur, especially in the elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally observed at the lower dosage ranges. In a few instances syncope has been reported. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularit nausea and constipation, extrapyramidal symptoms, increased and decreased libid all infrequent and generally controlled wit dosage reduction; changes in EEG patter (low-voltage fast activity) may appear dur and after treatment; blood dyscrasias (in- cluding agranulocytosis), jaundice and hepatic dysfunction have been reported o casionally, making periodic blood counts and liver-function tests advisable during protracted therapy.

Usual Daily Dosage: Individualize for ma mum beneficial effects. *Oral*—Adults: Mil and moderate anxiety and tension, 5 or 10 mg t.i.d. or q.i.d.; severe states, 20 or 25 mg t.i.d. or q.i.d. Geriatric patients: 5 r b.i.d. to q.i.d. (See Precautions.)

Supplied: Librium® (chlordiazepoxide HC Capsules, 5 mg, 10 mg and 25 mg—bottle of 50. Libritabs™ (chlordiazepoxide) Tab lets, 5 mg, 10 mg and 25 mg—bottles of 1 With respect to clinical activity, capsules and tablets are indistinguishable.

(50 mg. per ml.)

BSP®

ROMSULPHALEIN®
IN A COMPLETE,
STERILE,
DISPOSABLE,
& ECONOMICAL
PATIENT-UNIT.

BSP, one of the more valuable single laboratory procedures for determining hepatic function, is now packaged in a complete individual patient-unit.

Each BSP Disposable Unit contains a sterile syringe with the 5 mg./kg. BSP dosage schedule imprinted on the barrel, a sterile needle, alcohol swab and a 7.5 ml. or 10 ml. size ampule of terminally sterilized Bromsulphalein solution.

This all-inclusive disposable put-up lessens the chance of cross-infection and saves time and labor— the most costly commodities.

b.i.d.

The sensible schedule that covers the patient day and night

If your objective in the use of a broad-spectrum antibiotic is prolonged action, with high blood levels, then you know why b.i.d. DECLOMYCIN is considered to be a sensible dosage schedule.

The maintenance dosage of DECLOMYCIN can be kept at this convenient schedule because of its unusually high effective blood and tissue levels.

The b.i.d. dosage of DECLOMYCIN gives you the comfortable assurance that the patient is well-covered, *day and night.*

In clinical practice, blood levels produced by a therapeutic dose of DECLOMYCIN are high, prolonged, and effective; because of high serum binding and slow renal clearance. And if there's a broader susceptibility pattern of organisms, we've yet to see it.

There is no need to give higher daily dosage than 300 mg b.i.d., except in venereal diseases and Eaton Agent pneumonia.

DECLOMYCIN®
DEMETHYLCHLORTETRACYCLINE

Lederle

Prescribing information on next page.

b.i.d. The sensible schedule that covers the patient day and night

DECLOMYCIN Demethylchlortetracycline should be equally or more effective therapeutically than other tetracyclines when the offending organisms are tetracycline-sensitive.

Contraindication: History of hypersensitivity to demethylchlortetracycline.

Warning—In renal impairment, usual doses may lead to excessive accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated, and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort. Necessary subsequent courses of treatment with tetracyclines should be carefully observed.

Precautions—Overgrowth of nonsusceptible organisms may occure. Constant observation is essential. If new infections appear, appropriate measures should be taken. In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment.

Side Effects—Gastrointestinal system—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. Skin—maculopapular and erythematous rashes. A rare case of exfoliative dermatitis has been reported. Photosensitivity; onycholysis and discoloration of the nails (rare). Kidney—rise in BUN, apparently dose related. Transient increase in urinary output, sometimes accompanied by thirst (rare). Hypersensitivity reactions—urticaria, angioneurotic edema, anaphylaxis. Teeth— dental staining (yellow-brown) in children of mothers given this drug during the latter half of pregnancy, and in children given the drug during the neonatal period, infancy and early childhood. Enamel hypoplasia has been seen in a few children. If adverse reaction or idiosyncrasy occurs discontinue medication and institute appropriate therapy.

Average Adult Daily Dosage: 150 mg q.i.d. or 300 mg b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products. Treatment of streptococcal infections should continue for 10 days, even though symptoms have subsided.

In the treatment of syphilis a dosage schedule of a total of 12 to 18 Gm. given in equally divided doses over a period of 10 to 15 days should be followed. Close follow-up observation of the patient is recommended, including appropriate laboratory tests, since demethylchlortetracycline has not had adequate evaluation in all stages of syphilis. Spinal fluid examination should be included as part of this follow-up.

Acute gonococcal anterior urethritis in males has been treated effectively with a single dose of 600-900 mg. of DECLOMYCIN Demethylchlortetracycline. Individuals unable to tolerate large single doses due to gastrointestinal side effects may be treated with 150 mg. every 6 hours for a minimum of 4 doses or 300 mg. every 12 hours for a minimum of 2 doses. Females should be treated with a dosage of 150 mg. every 6 hours or 300 mg. every 12 hours until a cure is effected.

Primary Atypical Pneumonia (Eaton Agent): The average adult daily dosage is 900 mg. in 3 divided doses for six days.

THIRD FRANKLIN SQUARE HOSPITAL SEMINAR

Sunday, March 3, 1968

Topic: "The Role of the Emergency Department in the Community"

Speaker: Robert H. Kennedy, MD
Director, Field Program Committee on Trauma,
American College of Surgeons

Registration: 8:30 A.M.

Breakfast: 9-9:45 A.M.

Principal Address: 10:00 A.M. to Noon

Cost: $3.50

Dr. Kennedy is nationally recognized for his efforts to impove the quality of care in Emergency Departments. In many hospitals, the emergency department is the weakest area of hospital care. The intrinsic reasons are innumerable. Adding the extrinsic problem of the "outpatient explosion" further compounds this dilemma.

In Maryland alone, in 1965, there were 1,507,057 visits to organized clinics and emergency rooms. Outpatient visits are increasing at almost double the rate of inpatient days. Nationwide outpatient visits are running over nine million per month.

These trends are changing the complexion of medical practice in all parameters, from the general practitioner to the hospital-based physician, to say nothing of the changes required in hospital construction and administration.

TO SPEAK AT THE ANNUAL MEETING OF THE MEDICAL AND CHIRURGICAL FACULTY APRIL 17-28, 1968

In addition to speakers noted in the January issue of THE JOURNAL, the following eminent men of medicine are among those who will present papers during the three days in Baltimore at the Alcazar:

Dr. Vineberg

ARTHUR VINEBERG, MD, will give a paper on the surgery for coronary artery disease, which he has developed and is now widely used. This will be given on Thursday afternoon, April 18. He is Associate Professor of Surgery at McGill University and Senior Cardiac Surgeon at the Royal Victoria Hospital in Montreal. Dr. Vineberg received his MD, CM and MSc (biochemistry) from McGill University. He was a surgical houseman at the Bellevue Hospital, Presbyterian Division, New York. Dr. Vineberg in 1937 organized, and was chairman of, the first summer school in tuberculosis in Canada, which was modeled as closely as possible after the Trudeau School at Saranac Lake. In 1942 he was winner of the Casgrain-Charbonneau Prize, which is awarded to the McGill graduate who is under forty years of age and who, in the opinion of the Committee, has made the best contribution from date of graduation to the time of his 40th birthday. Dr. Vineberg has specialist certification by the Quebec College of Surgeons, Thoracic and General Surgery, and is a founder member of the American Board of Thoracic Surgery. Among the numerous memberships in scientific societies, he is a fellow of the American College of Chest Physicians, American College of Surgeons, American Heart Association, Montreal Heart and Canadian Heart Association, Canadian Medical Association, Montreal Clinical Society and Montreal Chirurgical Society.

Dr. Gastineau

CARE OF THE UNSTABLE DIABETIC will be the title of a paper to be given on Friday morning, April 19, by **CLIFFORD F. GASTINEAU, MD,** who is Associate Professor in Medicine at the Mayo Foundation Graduate School, University of Minnesota. Dr. Gastineau received his MD from the University of Oklahoma, and was a fellow in the Mayo Foundation for six years. He obtained a PhD in Medicine from the University of Minnesota in 1950 and since that time has been a member of the Staff of the Mayo Clinic. Dr. Gastineau is editor of the *Forecast,* a lay publication for diabetes sponsored by the American Diabetes Association, and is on the Editorial Board of the Journal *Diabetes.*

Dr. Hellman

LOUIS M. HELLMAN, MD, Professor and Chairman, Department of Obstetrics and Gynecology, State University of New York, Downstate Medical Center, will speak on the **SAFETY OF ORAL CONTRACEPTIVES.** This presentation also has been scheduled for Friday morning. Dr. Hellman received his MD degree from The Johns Hopkins University School of Medicine and served an internship in surgery and a residency in pathology at the New York Hospital, followed by an internship in obstetrics and a residency in gynecology at The Johns Hopkins Hospital. He was co-director of the obstetrical anesthesia program at The Johns Hopkins Hospital between 1946 and 1950. Dr. Hellman's current national positions include that of Chairman of the Executive Committee and Vice Chairman of the Board of Directors of the National Committee on Maternal Health, Associate Examiner for the American Board of Obstetrics and Gynecology, a member of the Research Advisory Board of the National Association for Retarded Children, a member of the Health Research Council of New York City, Chairman of the Advisory Committee on Obstetrics and Gynecology of the Federal Food and Drug Administration, a member of the Joint Commission on Mental Health of Children, and Chairman of the Board of Directors of the Association for the Study of Abortion. Dr. Hellman is a member of numerous scientific societies, has several editorial positions, has given many lectureships throughout the United States and abroad, and is the author of over one-hundred publications.

Before prescribing, see complete prescribing information in SK&F literature or *PDR*. A brief precautionary statement follows.

Contraindications: Glaucoma, prostatic hypertrophy, stenosing peptic ulcer, pyloroduodenal obstruction, or bladder neck obstruction.

Precautions: Use cautiously in the presence of hypertension, hyperthyroidism, coronary artery disease; warn vehicle or machine operators of possible drowsiness.

Usage in Pregnancy: Use cautiously, especially in the first trimester. *Note:* The iodine in isopropamide iodide may alter PBI test results and will suppress I^{131} uptake; discontinue 'Ornade' one week before these tests.

Adverse Reactions: Drowsiness; excessive dryness of nose, throat or mouth; nervousness; insomnia. Other known possible side effects of the individual ingredients: nausea, vomiting, diarrhea, rash, dizziness, fatigue, tightness of chest, abdominal pain, irritability, tachycardia, headache, difficulty in urination. Thrombocytopenia, leukopenia and convulsions have been reported but no causal relationship has been established.

a stuffy nose is no laughing matter

The State Department of Mental Hygiene and
The Baltimore Area Council on Alcoholism
will present
A One-Day Seminar for Physicians
on
TREATMENT OF ALCOHOLICS

Date: THURSDAY, MARCH 7, 1968

Place: MOUNT WILSON STATE HOSPITAL

Lewis P. Gundry, MD, Presiding
Chairman, Subcommittee on Alcoholism, Medical and Chirurgical Faculty

9:30 A.M.—REGISTRATION

10:00 A.M.—WELCOME TO MOUNT WILSON—William Newcomer, MD, Superintendent

10:15 A.M.—DIAGNOSIS AND OFFICE TREATMENT OF ALCOHOLISM—Marvin A. Block, MD

Presentation and open discussion

Dr. Block, a practicing physician in Buffalo, New York, was chairman of the AMA Committee on Alcoholism from 1954-64, and is currently a member of the AMA Committee on Alcoholism and Drug Dependence.

11:30 A.M.—INTERVIEW WITH AN ALCOHOLIC PATIENT—Maxwell N. Weisman, MD

Demonstration and open discussion

Dr. Weisman is Director of Alcoholism Programs for the Maryland State Department of Mental Hygiene, a member of the Faculty of Rutgers Summer School of Alcohol Studies, a consultant to the National Council on Alcoholism, Inc., and a member of the Task Force on Alcohol Problems of the National Council of Churches.

12:30 P.M.—LUNCHEON (Mt. Wilson Cafeteria)

1:30 P.M.—INTERDISCIPLINARY TREATMENT OF THE ALCOHOLIC PATIENT—Ruth Fox, MD

Presentation and open discussion

Dr. Fox is a practicing psychiatrist in New York City and Medical Director of the National Council on Alcoholism, Inc. She is co-author of *Alcoholism, Its Scope, Cause and Treatment,* and edited *Alcoholism—Behavioral Research Therapeutic Approaches.*

2:45 P.M.—CLOSING REMARKS AND GENERAL DISCUSSION

Application has been made for American Academy of General Practice Credits.

REGISTRATION FORM—SEMINAR ON TREATMENT OF ALCOHOLICS

Registration fee including lunch—$1.50 (All tickets will be held at registration desk.)

Enclosed is my check in the amount of ..... made payable to the MEDICAL AND CHIRURGICAL FACULTY for ..... (number) reservations for the Seminar on the Treatment of Alcoholics, Thursday, March 7, 1968 at Mount Wilson State Hospital.

Medical Specialty .....

Mail to: Seminar on the Treatment of Alcoholics, Medical and Chirurgical Faculty, 1211 Cathedral Street, Baltimore, Maryland 21201

DEPRESSION

NORPRAMIN®

(desipramine hydrochloride)

ANTIDEPRESSANT FOR RAPID IMPROVEMENT

At the recommended dosage level —initially, 150 mg. per day— gratifying remission of the signs and symptoms of depression typically begins in 2-5 days. Its specificity for depression, rapidity of action and usually mild side effects are significant reasons for prescribing NORPRAMIN (desipramine hydrochloride) in depression of any type . . . any degree of severity.

A few patients, sensitive to central nervous system stimulants may become restless as depression is lifted—in such cases dosage may be reduced or a tranquilizer added.

INDICATIONS: In depression of any kind—neurotic and psychotic.

CONTRAINDICATIONS: Glaucoma, urethral or ureteral spasm, recent myocardial infarction, severe coronary heart disease, epilepsy. Should not be given within two weeks of treatment with a monoamine oxidase inhibitor.

RELATIVE CONTRAINDICATIONS: (1) Patients with a history of paroxysmal tachycardia. (2) Patients receiving concomitant therapy with thyroid, anticholinergics or sympathomimetics may experience potentiation of effects of these drugs. (3) Safety in pregnancy has not been established. (4) Perform liver function studies in patients suspect of having hepatic disease.

PRECAUTIONS: (1) Outpatient use of desipramine hydrochloride should not be substituted for hospitalization when risk of suicide or homicide is considered grave. Suicidal ingestion of large doses may be fatal. (2) If serious adverse effects occur, reduce dosage or alter treatment. (3) In patients with manic-depressive illness a hypomanic state may be induced. (4) Discontinue drug as soon as possible prior to elective surgery.

ADVERSE EFFECTS: The following side effects have been encountered: dry mouth, constipation, dizziness, palpitation, delayed urination, agitation and stimulation ("jumpiness," "nervousness," "anxiety," "insomnia"), bad taste, sensory illusion, tinnitus, sweating, drowsiness, headache, hypotension (orthostatic), flushing, nausea, cramps, weakness, blurred vision and mydriasis, rash, *tremor*, allergy (general), altered liver function, ataxia and extrapyramidal signs, agranulocytosis.

Additional side effects more recently reported include: seizures, eosinophilia, confusional states with hallucinations, purpura, photosensitivity, galactorrhea, gynecomastia, and impotence. Side effects which could occur (analogy to related drugs) include weight gain, heartburn, anorexia, and hand and arm paresthesias.

DOSAGE: Optimal results are obtained at a dosage of 50 mg. t.i.d. (150 mg./day).

SUPPLIED: NORPRAMIN (desipramine hydrochloride) tablets of 25 mg.: bottles of 50, 500 and 1,000; and tablets of 50 mg. in bottles of 30, 250, and 1,000.

LAKESIDE

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

VACCINES: A SUCCESS STORY

Basic research in virology and immunology is paying off handsomely for medicine through enhanced ability to produce effective vaccines.

Measles (rubeola) vaccine has proven so effective that some clinicians speak of using it to "eliminate" the disease from the United States. An anti-measles vaccination campaign is being conducted by the American Medical Association and U.S. Public Health Service, and its success can be measured by the fact that fewer measles cases were reported during the first half of 1967 than in any comparable period since measles record-keeping began in 1912. Live-virus measles vaccine is recommended by many authorities now, in preference to killed-virus types.

At least four new vaccines should reach important stages of development within the next few months.

Licensure of a mumps vaccine was expected before the end of the year, according to one of its developers, Maurice R. Hilleman, PhD, Merck Institute for Therapeutic Research. It has been given to approximately 6,500 persons in experimental clinical trials "with excellent serologic response and protective efficacy, and without untoward clinical effect," Dr. Hilleman reported.

A vaccine against German measles (rubella) may be generally available within two years, according to investigators at the National Institutes of Health. Clinical trials with an experimental vaccine have been underway more than two years, with more than 500 persons vaccinated.

University of Chicago investigators hope during the next year to immunize about 200 children with an experimental vaccine designed to prevent streptococcal infections of the type which often are responsible for rheumatic fever and certain kinds of kidney disease. About 40 adults and 25 infants have received the vaccine since its development last year. Twenty of the 25 infants responded with production of antibodies capable of destroying streptococcus, reported Eugene N. Fox, PhD, Albert Dorfman, MD, and associates.

A vaccine to prevent erythroblastosis fetalis (Rh disease) also may be licensed in 1968. The vaccine is an anti-Rh immune globulin which is given to an Rh-negative mother after the birth of her first Rh-positive infant. The globulin acts to prevent an immunological attack by the mother's body upon the fetus during a second pregnancy, presumably through a mechanism of antibody-induced immunosuppression.

EXECUTIVE SECRETARY'S NEWSLETTER

February, 1968

REFERENCE COMMITTEE HEARING

Wednesday, March 13, at 8:00 p.m., at the Faculty Building is the present schedule for the Reference Committee meeting on Resolutions for the Annual Meeting.

STATE LEGISLATIVE ACTIVITY

Members are urged to watch for the several issues of The Assemblyman, the Faculty's Legislative Newsletter, mailed periodically during the annual session of the State Legislature.

Individual bills involving the profession are reported on, together with the Faculty's position on such a bill, if one is being taken.

Those physicians interested in specific proposals or bills should advise the Faculty office so they can be informed of public hearings or pertinent data involving such legislation.

ALCOHOLISM MANUAL

Copies of the "Manual on Alcoholism" are available to members through the Faculty office.

IMPORTANT INFORMATION

The Federal Government, in announcing the new $4.00 monthly rate for Medicare, Part B, has given the following data as to the distribution of the increase of $1.00:

20¢ to finance the program at the level of operation of the past, because of low estimates of the financing;

25¢ because of a higher utilization of benefits by subscribers, because the $50. deductible portion will exclude a smaller portion of medical expense as the utilization increases;

25¢ because of expected increase in the cost of physicians fees during the next five years;

23¢ to pay for increased benefits, such as full payment for diagnostic radiology and pathology;

7¢ to cover contingency purposes.

NEWS NOTES

A special MEDIC program is to be presented on Thursday, February 29, from 1 to 4 p.m., on the network. The subject is Comprehensive Seminar on Effects of Rubella epidemic of 1964.

NEWS NOTES (cont'd)

New officers of the Maryland Society of Pathologists include: Watson P. Kime, M.D., President; Harlan I. Firminger, M.D., Vice-President; W. Bradley King, Jr., M.D., Secretary-Treasurer; and Robert L. Cavenaugh, M.D., Edward L. Sherrer, M.D., John E. Adams, M.D., Councilors; Robert G. Lancaster, M.D., ASCP Councilor; and Lawrence F. Misanik, M.D., Alternate ASCP Councilor.

Mr. Walter B. Thomas has been named Executive Director of the Maryland Diabetes Association.

New Fellows of the American College of Anesthesiology include: Michael N. Ashman, M.D., and Rogelio M. Carrera, M.D., both of Baltimore.

NEW WORKMEN'S COMPENSATION FORMS

A new SF-2, Workmen's Compensation form is announced by the Workmen's Compensation Commission.

The main purpose of the new form is to rearrange the information and to provide additional space where needed.

Physicians should use up their current supply of SF-2, requesting the new form when their supply is exhausted.

A copy of the new form will be mailed with the next issue of The Assemblyman, so that physicians can become acquainted with it.

Physicians are reminded that an Early first report must be filed as well as Progress and Final reports. Cooperation of the profession is the foundation on which the State Rehabilitation program can be built.

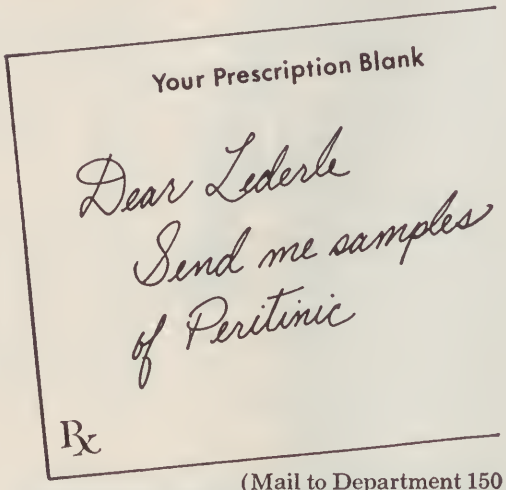
THE MONTH IN WASHINGTON

President Johnson signed into law the social security legislation which included changes in medicare and medicaid advocated by the medical profession.

The legislation provides for a record high minimum 13% increase in cash benefits for 24 million Americans, starting in March. Beginning April 1, one dollar a month of the increase will be withheld from the checks of those participating in voluntary Plan B of medicare which covers part of physician fees and other medical services other than hospitalization.

The total premium for Plan B insurance is now $6 a month, half of which is paid by the federal government. Beginning April 1, the premium will be increased to $8, with the government paying $4 and the participant $4.



According to HEW, about 20 cents of the $1 increase was needed to cover costs which were originally underestimated. Another 25 cents would cover expected increase of use under the program. An anticipated 5% increase in physician fees would account for another 25 cents.

The social security taxable base also was increased, effective January 1, from $6,600 to $7,800. The tax rate for this year will remain the same as under the old law, 4.4% on both the employee and employer and 6.4% on the self-employed. Tax rate increases are set for subsequent years through 1987.

Here's what you do to get samples of the

anticostive* hematinic

(Mail to Department 150
Lederle Laboratories,
Pearl River, New York 10965)

* anticostive, *adj.* (*anti* opposed to + *costive* causing constipation.) Against constipation. (Now isn't that a good idea in an iron-containing hematinic?)

Medicare Changes

- Payment of physician fees is authorized either to the patient on the basis of an itemized bill, either unpaid or receipted as paid, or to the physician under the assignment method.
- Payment is authorized for full reasonable charges for radiological or services furnished by physicians to hospital inpatients.
- Hospital outpatient diagnostic services are transferred from the hospital insurance program (Plan A) to the supplementary medical insurance program (Plan B). The change was designed to simplify the procedure for paying benefits for hospital outpatients.
- The requirement of physician certification of the medical necessity for admission to general hospitals and for hospital outpatient services was eliminated.
- Medicare beneficiaries are given a lifetime reserve of 60 additional days of hospital care after the 90 days covered in a spell of illness. The beneficiary must pay the first $20 per day for the additional hospitalization.
- The Secretary of HEW was directed to study and report to Congress by January 1, 1969, the effects of covering drugs under medicare and of establishing quality and cost standards for drugs provided under social security health programs.
- Services of podiatrists are authorized under medicare to the extent that a state's law permits, but routine foot care is not covered.
- Outpatient services furnished by physical therapists are authorized within certain limitations.
- The Secretary of HEW was directed to study and make recommendations of adding services of chiropractic and optometrists to Plan B.
- Payment is authorized under Plan B for diagnostic X rays taken in a patient's home or a nursing home.

Medicaid Changes

- States are limited in setting eligibility income levels for federal matching purposes.
- States are given until January 1, 1970, to buy-in medicare Plan B insurance for aged medicaid beneficiaries.

• States are authorized to make direct payments to medicaid beneficiaries for physicians' and dentists' services if the beneficiary is not receiving cash assistance.

• States are permitted to select either the five basic health services, or 7 out of the 14 authorized, for the medically indigent. The basic 5 must be provided for those receiving welfare cash benefits. The basic 5 are: inpatient hospital services, outpatient hospital services, other laboratory and X-ray services, skilled nursing home services and physicians' services.

• States must license administrators of nursing homes and set minimum nursing home standards if these institutions are to be eligible to participate in the medicaid program.

• States must establish methods and procedures to safeguard against unnecessary utilization of health care services and to assure that payments for such services and drugs do not exceed reasonable charges.

Under the program for Aid to Families with Dependent Children (AFDC), states now must offer birth control services to appropriate beneficiaries with acceptance on a voluntary basis. Authorizations for federal financial aid for maternal and child health programs are increased. Services of optometrists are added to child health programs.

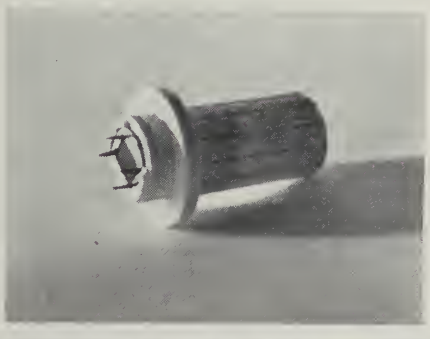
* * * * *

James L. Goddard, MD, commissioner of the Food and Drug Administration, estimated that about 300 drugs, marketed under 1,600 brand names, will be forced off the market because of ineffectiveness for treatment of medical conditions.

An evaluation of some 3,000 drugs placed on the market from 1938 to 1962 was started in June, 1966. It is being conducted by 29 panels of 200 medical and pharmaceutical specialists under the direction of the National Academy of Sciences–National Research Council. With the first panel reporting in January, the last report is due in mid-1969.

The FDA assigned the evaluation to the academy following passage of the Kefauver Drug Law in 1962. The law's main thrust was to give FDA power to pass on the efficacy as well as the safety of drugs marketed after 1962, but a provision authorized the government to review drugs already on the market.

The federal government has licensed a live, attenuated mumps virus vaccine especially recommended for adolescent and male adults who can become sterile from the relatively innocuous childhood disease.



The vaccine, developed over a five-year period by the Merck, Sharp and Dohme Research Laboratories, was not recommended for routine use in infants and young children pending development of more information in the duration of the immunity it provides.

William H. Stewart, MD, U. S. Surgeon General, said excellent protection against naturally occurring mumps has been observed for the first year after the single-infection live vaccine.

"But limited data on natural exposure during the second year indicate continuing protection although additional observation will be required to determine the duration of immunity protection," he said.

To fight TB- find it first!

Make tuberculin testing routine with every physical examination.

TUBERCULIN, TINE TEST
(Rosenthal)

Side effects are possible but rare: vesiculation, ulceration, or necrosis at test site. Contraindications: none, but use with caution in active tuberculosis. Available in 5's and 25's.

HOW MUCH INSURANCE AND OTHER ASSETS SHOULD YOU HAVE, TO SET UP A TRUST ESTATE?

LIFE INSURANCE	
REAL ESTATE	
CASH	
STOCKS AND BONDS	
EMPLOYEE BENEFITS	
OTHER PROPERTY	
TOTAL	

A small fortune?

That's what most people think. But they're absolutely wrong!

Spend a few minutes with the chart on the left, and estimate the size of your present estate. Counting life insurance, equity in your home and other assets it may well surprise you.

But maybe you're wondering *why* you should consider setting up an Insurance Trust or Trust Estate of any kind. Ask your attorney. The "reasons why" vary with each individual. But, it may be a *must* for you.

We live in an age of complex tax and inheritance laws. And the protection of an individual estate often depends on how well an individual has provided for the distribution of his (or her) property starting with a properly drawn will.

It is not a simple matter. And yet, with professional legal counsel and the assistance of our Trust Department, it's not "horribly complicated" either.

So see your attorney about the advisability of setting up a Trust Estate. You owe it to your heirs.

MERCANTILE-SAFE DEPOSIT and TRUST COMPANY

Main Office: CALVERT & REDWOOD STREETS • Trust Division: 13 SOUTH STREET

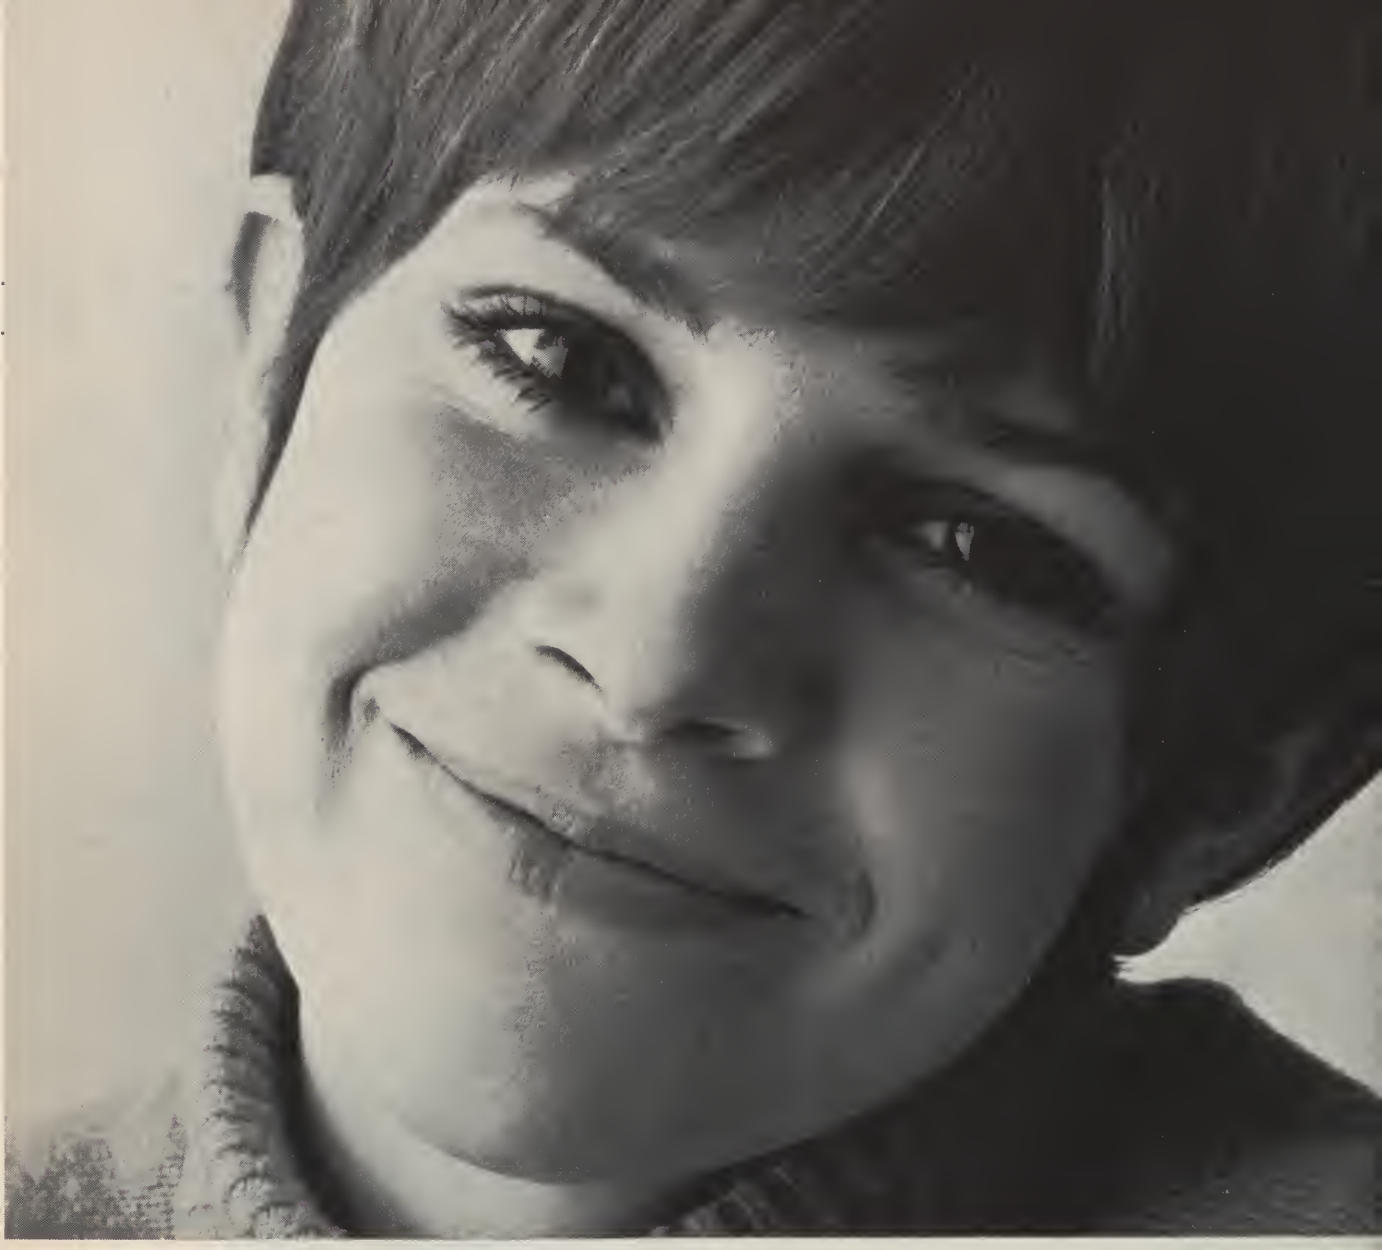

Photo professionally posed.

No injection after all!

This penicillin produces high, fast levels—orally.

Pen•Vee® K is usually so rapidly and completely absorbed that therapeutic penicillin levels are attained within 15 to 30 minutes. Thus it can often obviate the need for penicillin injections. The higher serum levels produced generally last longer than with those of oral penicillin G.

Indications: Infections susceptible to oral penicillin G: prophylaxis and treatment of streptococcal infections; treatment of pneumococcal, gonococcal, and susceptible staphylococcal infections; prophylaxis of rheumatic fever in patients with a previous history of the disease.
Contraindications: Infections caused by nonsusceptible organisms; history of penicillin sensitivity.
Warnings: Acute anaphylaxis (may prove fatal unless promptly controlled) is rare but more frequent in patients with previous penicillin sensitivity, bronchial asthma or other allergies. Resuscitative (epinephrine, aminophylline, pressor amines) and supportive (antihistamines, methylprednisolone sodium succinate) drugs should be readily available. Other rare hypersensitivity reactions include nephropathy, hemolytic anemia, leucopenia and thrombocytopenia. In suspected hypersensitivity, evaluation of renal and hematopoietic systems is recommended.
Precautions: In suspected staphylococcal infections, perform proper laboratory studies including sensitivity tests. If overgrowth of nonsusceptible organisms occurs (constant observation is essential), discontinue penicillin and take appropriate measures. Whenever allergic reactions occur, withdraw penicillin unless condition being treated is considered life threatening and amenable only to penicillin. Penicillin may delay or prevent appearance of primary syphilitic lesions. Gonorrhea patients suspected of concurrent syphilis should be tested serologically for at least 3 months. When lesions of primary syphilis are suspected, dark-field examination should precede use of penicillin. Treat beta-hemolytic streptococcal infections with full therapeutic dosage for at least 10 days to prevent rheumatic fever or glomerulonephritis. In staphylococcal infections, perform surgery as indicated.
Adverse Reactions: (Penicillin has significant index of sensitization): Skin rashes, ranging from maculopapular eruptions to exfoliative dermatitis; urticaria; serum sickness-like reactions, including chills, fever, edema, arthralgia and prostration. Severe and often fatal anaphylaxis has been reported (see "Warnings").
Composition: Tablets—125 mg. (200,000 units), 250 mg. (400,000 units), 500 mg. (800,000 units); Liquid—125 mg. (200,000 units) and 250 mg. (400,000 units) per 5 cc.

Wyeth Laboratories Philadelphia, Pa.

ORAL **PEN•VEE® K**

(potassium phenoxymethyl penicillin) Wyeth®

If hypothyroidism leaves your patient feeling like this...

consider

LETTER®

(SODIUM LEVOTHYROXINE, ARMOUR) TABLETS

Synthetic Thyroid Replacement Therapy

Letter® provides all the advantages of the synthetically pure chemical sodium levothyroxine. Dosage is precise and potency is consistently uniform.

and

Letter® is micronized to provide maximum opportunity for full absorption and clinical response.

In addition Letter® is distinctively color coded with an identifying number stamped on each tablet to provide accurate dosage control.

Indications: Hypothyroid conditions. **Contraindications:** Thyrotoxicosis, acute myocardial infarctions unless associated with hypothyroidism. In hypothyroidism with hypoadrenalism coadministration of corticoids with LETTER® is recommended. **Precautions and Side Effects:** Excessive dosage may result in diarrhea, cramps, palpitation, nervousness, rapid pulse, sweating. If symptoms appear, discontinue medication for several days, then reinstitute at a lower level. Since myxedema patients with heart disease may suffer seriously from abrupt increases in dosage, caution should be exercised in adjusting dosage. **Dosage:** Generally, the initial adult dosage is 0.1 mg. daily. This may be increased in small increments every one to three weeks until proper metabolic balance is achieved. **Available:** Bottles of 100 tablets, in six potencies: 0.025 mg. (violet), 0.05 mg. (peach), 0.1 mg. (pink), 0.2 mg. (green), 0.3 mg. (yellow), and 0.5 mg. (white).

½ gr. (No. 3), 1 gr. (No. 4)
(Warning: may be habit forming)

Contraindications: Hypersensitivity to any ingredient.

Precautions: As with all phenacetin-containing products, avoid excessive or prolonged use.

Side Effects: Side effects are uncommon—nausea, constipation and drowsiness have been reported.

A-H-ROBINS

A. H. ROBINS CO., INC., Richmond, Va. 23220

For your impatient cold patients

Two sprays from NTZ Nasal Spray—and nasal congestion, rhinorrhea, sneezing are reduced for *immediate* comfort for patients with colds.

NTZ is more than a simple vasoconstrictor. It contains:

Neo-Synephrine® (brand of phenylephrine) HCl 0.5 per cent, the major component, virtually synonymous with fast, efficient but gentle nasal vasoconstriction on contact.

Thenfadil® (brand of thenyldiamine) HCl 0.1 per cent, topical antihistamine for reduction of rhinorrhea, sneezing or itching. It combats the allergic reactions that may occur in colds or sinusitis.

Zephiran® (brand of benzalkonium, as chloride, refined) 1:5000, antiseptic preservative and wetting agent to promote penetration and spread of the formula.

NTZ is well tolerated. Used in a cold it may help prevent sinusitis by opening sinus ostia and permitting drainage. It may also be used in sinusitis to help establish drainage.

The spray is best used twice, the second a few minutes after the first, repeated every three or four hours as needed. NTZ is for temporary relief of nasal symptoms, and overdosage should be avoided.

Supplied: NTZ Nasal Spray, plastic squeeze bottles of 20 ml.; NTZ Nasal Solution, bottles of 30 ml. (1 fl. oz.) with dropper.

Book Reviews

NEUROLOGY OF THE VISUAL SYSTEM, by David G. Cogan, MD, Charles C. Thomas, Springfield, Ill.

Written as a companion to *Neurology of the Ocular Muscles,* this volume presents clinical aspects of the ocular sensory system. The clinical syndromes and their anatomophysiologic explanations are presented as briefly as is compatible with a clear exposition of their manifestations. The text follows an anatomic order. The viewpoint is primarily the author's, with abundant references to both support and refute his position.

PERSPECTIVES IN EXPERIMENTAL GERONTOLOGY, Nathan W. Shock, PhD; Charles C. Thomas, Springfield, Ill.

The goal of this book is to present an overview of ideas in the field of experimental gerontology, with emphasis on ideas and experiments. It represents, therefore, more a collection of essays than a detailed summary of all the factual data on specific problem areas.

Well organized throughout, it is not, however, by any means as complete as it might be. Space limitations required the "leaving out" of certain areas. Nonetheless, it is well worth adding to your library.

MENDELIAN INHERITANCE IN MAN, Victor A. McKusick; The Johns Hopkins Press, Baltimore, Md.

This publication is primarily a catalogue of the autosomal dominant, autosomal recessive and X-linked phenotypes. For the first time it utilizes the computer system for assemblying and the "print-out" from such system for the publication of this book. As a reference book it is an excellent addition to the medical library.

CLINICAL MANAGEMENT OF BEHAVIOR DISORDERS IN CHILDREN, Harry Bakwin, MD, and Ruth Morris Bakwin, MD; W. B. Saunders Company, Philadelphia, Pa.

This volume is a distillation from a large amount of literature and from the long and careful experience of the authors of those data that are most helpful in understanding and treating behavior problems in children. This is the third edition of this publication and it is comprehensive, practical and full of common sense. The gratitude of all pediatricians, child psychiatrists and parents should be rendered to them for such a clear and concise job of medical writing.

THE THEORY AND PRACTICE OF PSYCHIATRY, Fredrick C. Redlich, MD, and Daniel X. Freedman, MD; Basic Books, Inc., New York.

This thoroughly modern text is firmly rooted in history. No area of psychiatry is allowed to go by default, yet no single attitude is allowed to dominate. It is balanced, accurate and well-documented. It is a source book for case-centered observation, for clinical debate and for academic discourse.

THE BIOSOCIAL BASIS OF MENTAL RETARDATION, Sonia F. Osler, PhD and Robert E. Cooke, MD; The Johns Hopkins Press, Baltimore, Md.

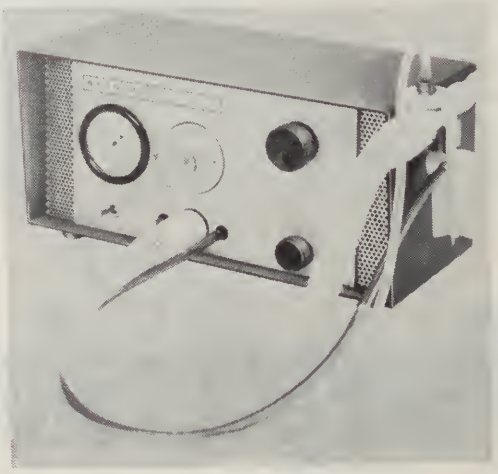
This collection of various lectures dealing with mental retardation was prepared because of the heavy demand for such information. It is a direct result of a seminar course at the Johns Hopkins University School of Medicine established in 1960. It is an attempt to bring to students of medicine the most recent scientific developments in a field of great national concern. The publishers and authors have done well.

APPRAISAL OF CURRENT CONCEPTS IN ANESTHESIOLOGY, Vol. 3, Edited by John Adriani, MD, Professor of Surgery, Tulane University School of Medicine, New Orleans, Louisiana. C. V. Mosby Co., St. Louis, Mo.

This is the third edition of a collection of reviews prepared by the staff and residents in the Department of Anesthesiology at Charity Hospital and edited by Dr. Adriani. It is slightly larger than the second volume which was published in 1964, but very similar in style and format.

The aim of the book is to bridge the time gap between the current literature and its incorporation into future textbooks. In all, 50 different topics are covered. These reviews are primarily written for the practicing anesthesiologist and vary from subjects of clinical interest, i.e., adverse drug reactions, the use of drugs for cardiorespiratory resuscitation, hepatotoxicity of preoperative agents and the distribution and fate of volatile anesthetics, to equally valuable topics in fields allied to anesthesia, i.e., electrolyte disturbances in banked blood, the limits of radiation for hospital personnel, and the use of antineoplastic drugs during anesthesia. For those who need more detail or who desire to read further, there are ample references at the end of each review.

Dr. Adriani has concluded this edition with a comprehensive list of subject matter that he and other program directors feel should be taught to current residents in anesthesia. This is a dull reading in one sense, but it is also stimulating in that it encourages the reader to take an inventory of just what his own efforts have achieved in keeping up with today's concepts in anesthesia.



The book's handy size and brief reviews lends itself to the busy clinician who wishes to utilize short breaks in his schedule.

EDWARD S. KLOHR, JR., MD

BENNETT PRESSURE BREATHING THERAPY UNITS

Electrically powered IPPB Therapy Units from Bennett, the IPPB pioneer. Compress, regulate, and deliver room air or assist breathing, with optional means of delivering nebulized medication. Adjustable to best breathing rate for the individual patient. Simple and direct controls mean dependable operation and minimum maintenance. Other models for use in oxygen enrichment.

THE NEUROSES: BY HENRY P. LAUGHLIN, MD

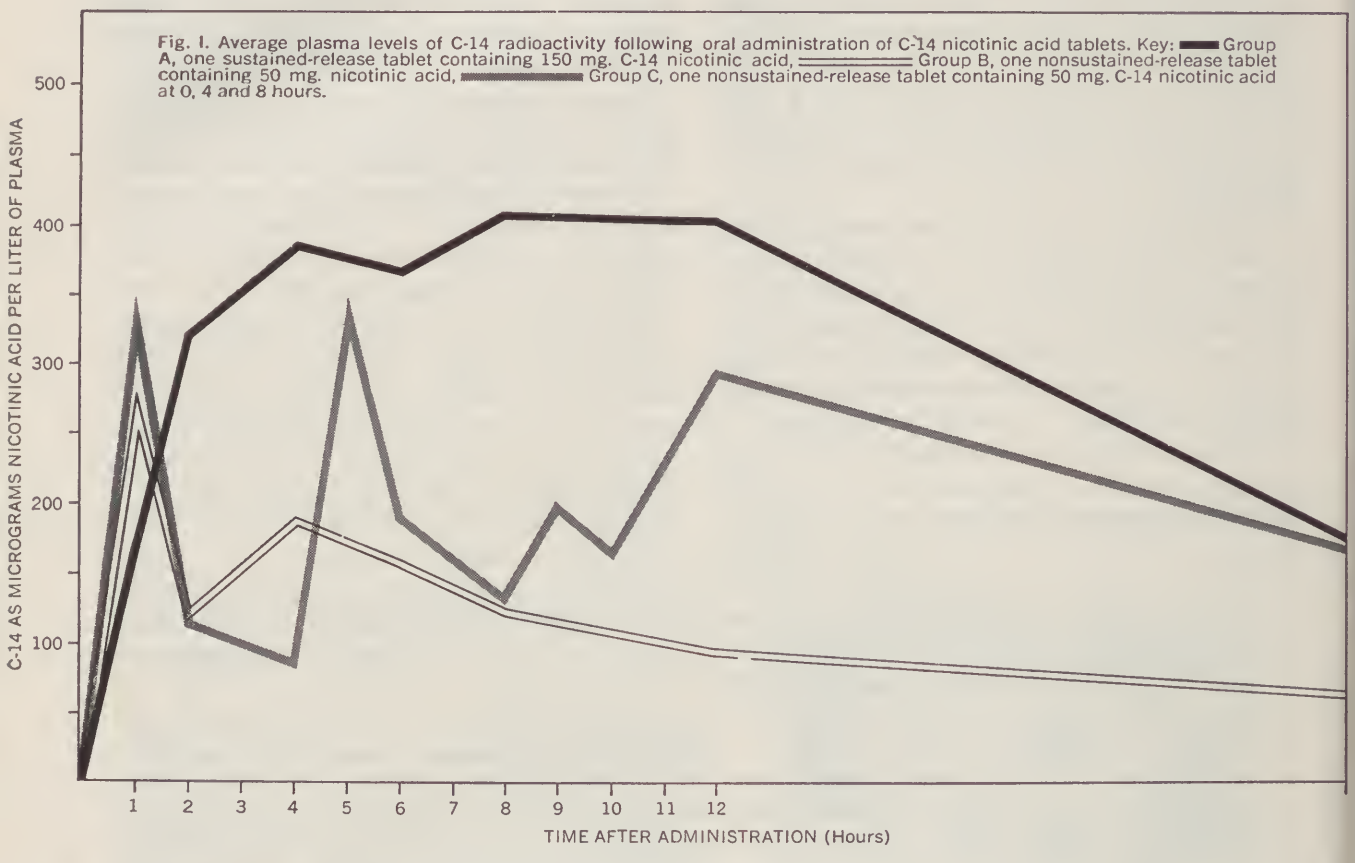
This volume, the successor to *The Neuroses in Clinical Practice* which was published in 1956, is an encyclopedic reference work covering all of the neuroses and character disorders usually encountered in clinical practice. The fact that it was produced by a single author but covers a wide field allows an integration and inter-relatedness missing in many comprehensive volumes by multiple authors.

Dr. Laughlin's theory of the etiology of the neuroses is psychoanalytically oriented and leans heavily on the concept that anxiety and its defensive reduction are central issues in all of the neuroses. His first chapter describes the many aspects of anxiety in a comprehensive way. The theme of conflict → anxiety → repression → symptoms initiated in this chapter is carried throughout the book with variations on the theme comprising descriptions of the various diagnostic categories of neuroses. "The underlying presence of intrapsychic conflict with the resulting tension, attempted defenses, and sought after resolution and its disguised outward expression is to be recognized today as the central dynamic concept in the origin of the neurotic and the functional psychotic emotional illness."

The second chapter also merits special comment. This chapter is devoted to an intense exploration of the concept of primary and secondary gain of emotional illnesses. Epigain (unconscious primary gain) and endogain (unconscious secondary gain) are differentiated from the more conscious secondary gain of the illness. These concepts, always mentioned as an integral part of emotional illness, are rarely elaborated as clearly as in this chapter.

For the most part the remainder of the book is devoted to descriptions of various neurotic illnesses, their psychodynamics, and treatment. In general, the diagnostic classification follows the currently used terminology with a few notable exceptions. The hypochrondrical reactions are described separately under the newly coined heading hygeiaphrontic (hygia meaning health, phrontis meaning "anxious concern about") reactions. The fatigue reactions are described separately from the depressive reactions because of their medical importance and some differences from the typical depressive reaction. In his chapter on Soterial Reactions Laughlin emphasizes a common phenomenon by defining and naming it. It would perhaps be more easily, but less aesthically, recognizable as the "Linus blanket" syndrome. Soterial ("a security of guarantee or safety") objects are extremely common but rarely a presenting complaint. There are also chapters on neuroses following trauma and military reactions.

The Neuroses is written in a simple, direct, almost conversational or lectorial form which makes it easily readable. This form does, however, encourage repetition which is somewhat distracting in such a comprehensive volume. Although possibly useful to the student using this as a textbook, this reviewer found the author's promulgation of "tenets," "concepts" and "principles" difficult to integrate and apply in a useful and meaningful way. The book is well indexed and has an extensive outline of chapter contents at the beginning of each chapter plus references and review questions at the end of each chapter. Included as appendices are an outline classification of mental illness and a glossary of psychiatric terms and concepts. Descriptions of concepts and illnesses are well illustrated with almost 200 case histories and there are 48 tables summarizing various aspects of the material presented.



The book is highly recommended to medical students and residents in psychiatry as a basic textbook on the neuroses. It should also be very useful to the practicing physician (whether or not he specializes in psychiatry) and the teacher of psychiatry as a reference work.

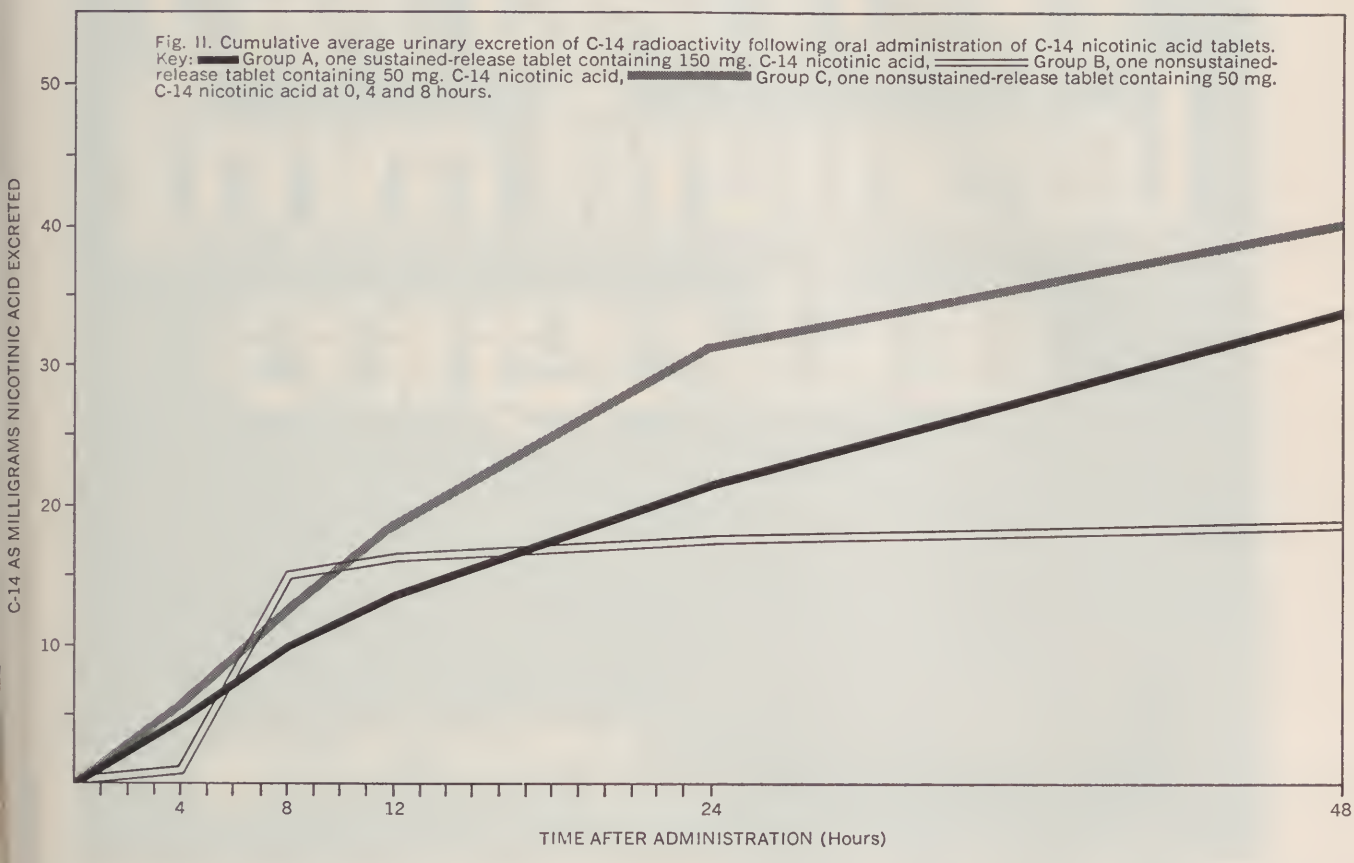
THURMAN MOTT, JR., MD
Frederick Medical Center, Frederick, Md.

Ed. Note: *The Neuroses*, Henry P. Laughlin, MD; New York, Appleton-Century Crofts, 1967.

Dr. Laughlin is a past president of the American College of Psychiatrists; Associate Clinical Professor of Psychiatry, George Washington University School of Medicine, Washington, D.C.: Head, Division of Psychiatry, Suburban Hospital, Bethesda, Maryland.

Sustained circulatory, respirator
and cerebral stimulation for th

(fewer absent doses by absent-minded patients)



Human volunteer subjects were administered Geroniazol TT tablets with the nicotinic acid component made radioactive with C-14. Plasma and urine samples were analyzed. (See Figures I and II) The radioactive tracer study substantiated the previous clinical evidence that the release of nicotinic acid from the Geroniazol TT tablet produced a gradual rise in plasma levels to a plateau for a total of 12 hours and more.

Such proven sustained activity makes the management of geriatric patients much easier by minimizing the possibility of neglected doses through absent-mindedness or senile confusion. Therapy *can* be continuous on a daily dose of only one Geroniazol TT tablet every 12 hours.

The gradual release of nicotinic acid in Geroniazol TT will provide the well-known peripheral vasodilatation needed in patients with deficient circulation and with a minimum amount (if any) of "flushing." Also, cerebrovascular circulation is complemented by pentylenetetrazol, long-established as a cerebral and respiratory stimulant.

Geroniazol TT improves the typical, unfortunate, signs of senile confusion. Patients become more alert,

ged and debilitated

less confused and moody. Personal care, memory, emotional stability, social attention improve. Fatigue, apathy and irritability are reduced.

A prescription for 100 tablets of Geroniazol TT will permit your patients to enjoy the benefits of time-prolonged nicotinic acid/pentylenetetrazol therapy, at an economical price. Dosage is only one tablet every 12 hours.

Contraindications: There are no known contraindications.

Precautions: Exercise caution when treating patients with a low convulsive threshold.

Side Effects: Side effects are rarely encountered, however due to the vasodilatation effect of nicotinic acid, transitory mild nausea, flushing, tingling and pruritus are possible.

Dosage: One tablet every 12 hours.

Supplied: Prescribe bottles of 100 tablets, to take advantage of recent price reduction.

Get fast relief from financial congestion.

Use First National Bank's new Professional Loan program. It takes a lot of money these days to hang out a shingle. Besides the shingle, you need office furniture, diagnostic equipment, and perhaps sophisticated laboratory equipment. Even if you join a colleague who has an established practice, you don't do it for nothing.

Your greatest expense comes at a time when you can probably least afford it. Isn't that always the way it is?

We're sympathetic.

So much so, in fact, that we've created a special new loan program for professional people. It's good for any professional need, any time. Even after years of practice, for example, you may need costly new equipment.

One thing special about this program is the interest rate: a low 4½ percent. Not only that, you can take as long as seven years to repay the loan. This way, you have an operating expense spread over a reasonable time period.

Don't let temporary financial congestion cramp your plans for starting practice or an expensive research effort. We can offer fast, long-lasting relief.

First National Bank of Maryland
where being FIRST makes all the difference.

For further information on this special low-rate Professional Loan: in Baltimore, call SA 7-4000, and ask for Mr. Jack Ortt or Mr. Dave Freese; in Hagerstown, RE 3-6000, Mr. Frank McConell or Mr. Bob La Follette; in Rockville, PO 2-8800, Mr. Walter Clark or Mr. Ray Greenstreet; in Salisbury, PI 2-8143, Mr. Ross Waterman or Mr. Ted Crockett. Or ask any branch manager.

THE MULTIPLE ROAD

An experimental method of treating cancer by selectively starving tumor cells of essential amino acids has prolonged the lives of a number of patients, two University of Chicago cancer researchers reported.

Albert B. Lorincz, MD, and Robert E. Kuttner, PhD, described their studies at the 116th Annual Convention of the American Medical Association.

Biochemical assays of tumor cells have shown that every tumor has individual and distinctive amino acid requirements, Drs. Lorincz and Kuttner said.

Clinical experience with carefully selected, volunteer patients has indicated that, when the amino acid content of a tumor is determined through assay, it can sometimes be caused to regress when the patient is fed a diet that is deficient in the specific amino acids that the tumor requires. Of 30 patients so treated, the investigators said, 20 had experienced comfortable prolongation of life from four to 22 months. Patients were not selected for the experimental diet-therapy program unless usual clinical procedures had been proven inapplicable.

Basic research which seeks the cause of cancer may get a boost from the work of another team of

OF CANCER RESEARCH

investigators, who worked out the intricate molecular structure of the enzyme ribonuclease.

David Harker, PhD, who has been studying the enzyme's protein structure for 16 years, commented in announcing the results of the investigation:

"The life process depends upon the orderly behavior of complex forces acting within protein molecules, and their interactions and reactions with neighboring molecules.

"It is possible that, when the atomic structures of proteins are altered in some manner, there may be a relationship to cancer."

Ribonuclease is a protein, as are most enzymes.

Dr. Harker is director of the Center for Crystallagraphic Research at Roswell Park Memorial Institute, Buffalo, N.Y., where he and coworkers conducted the ribonuclease research. More than a half-million reflections were taken of ribonuclease crystals in the investigators' X-ray diffraction unit in order to precisely map the position of the 1,000-plus atoms in the ribonuclease molecule.

Ribonuclease works within the cell to break down ribonucleic acid, and thus exert a control on cell growth; at the cell's death, the enzyme acts as a "housecleaner" to remove freed ribonucleic acid.

Nothing else I've tried seems to work, so I decided to give you a crack at it.

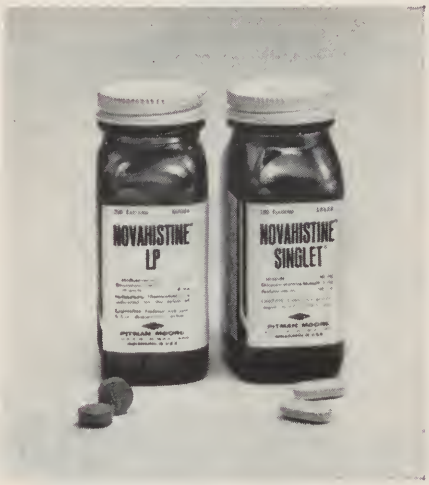
Some U.R.I. patients are more miserable than others.

That's why we make Novahistine® tablets in two different formulations.

And let you control the dosage.

With Novahistine LP tablets and Novahistine Singlet tablets you have the range and flexibility of decongestant dosage that lets you prescribe for the needs of the individual patient.

Novahistine LP tablets are most useful for relief of nasal congestion in patients without pain or fever.



Novahistine Singlet tablets, which provide analgesic-antipyretic effect, as well as decongestant action, are indicated for upper respiratory infections accompanied by pain, aches and fever.

Whether you prescribe Novahistine LP or Novahistine Singlet, a total daily dose of 3 or 4 tablets will usually provide effective, continuous relief.

Use cautiously in patients with severe hypertension, diabetes mellitus, hyperthyroidism or urinary retention. Caution ambulatory patients that drowsiness may result.

Each Novahistine LP tablet contains phenylephrine hydrochloride, 25 mg.; and chlorpheniramine maleate, 4 mg.

Each Novahistine Singlet tablet contains phenylephrine hydrochloride, 40 mg.; chlorpheniramine maleate, 8 mg.; and acetaminophen, 500 mg.

* * *

The Board of Directors of the Baltimore City Medical Society met at 1211 Cathedral St., Baltimore, Md., on January 9, 1968 at 4:30 P.M. The meeting was called to order by Dr. Frank Kaltreider. Eight of the members of the Board of Directors were present at this meeting. The minutes of the December 12th meeting were read and approved by the Board. The Board approved the appointments to Emeritus Membership of Doctors Byruth Lenson-Lambros, Ernest L. Stebbins and

J. Wesley Edel. The Board decided that no nominee for the Community Service Award be submitted for 1968. The Board plans to make arrangements with the hospitals designated for the general meeting for the serving of refreshments after meetings.

Dr. Kaltreider read a letter sent him by Howard Moses, Chairman of the Legislative Committee of the Baltimore City Medical Society suggesting that a closer liaison with the Baltimore City Council in regard to legislative matters in the city of a medical nature be brought about. He suggested this could be done by the selection of a qualified member to serve in this capacity. After some discussion, the Board decided to contact Dr. Emerson Julian, a member of the City Council, to serve in this capacity.

Dr. Kaltreider announced that the Baltimore City Health Department expressed a need for physician coverage for their Well Baby Clinics in the city.

A report filed by the Professional Relations Committee stated that frequently, when correspondence is necessary between this committee and an individual physician, the physician against whom charges have been levied frequently adapts the attitude of a personal allegation, levied by the communicating member of this committee. The Board would like the membership to be reminded that the actions of this committee are not levied by any single individual serving on this committee, since these judgments are the combined opinion of the professional relations committee as a group. It is hoped that in the future the membership will interpret such criticism as "the opinion of this committee" and not those of the individual member acting as the communicative officer.

FREDERICK COUNTY MEDICAL SOCIETY

The Frederick County Medical Society held its annual election meeting and oyster feed on December 19th, 1967.

Rex Martin, MD, was elected and installed as our new President succeeding Richard L. Fruth, MD, who had served us for two years.

Other officers elected to support Dr. Martin were: Ernest Dettbarn, MD, President-Elect, Fred Baker, MD, Treasurer and A. A. Pearre, Jr., MD, Secretary.

Our January meeting was noteworthy for two reasons. We were privileged to have as our distinguished guest speaker George Yeager, MD, and as a bonus, we were introduced to the very nice and new Red Horse Restaurant in Frederick. Dr. Yeager's talk and the fine food were enjoyed by all present.

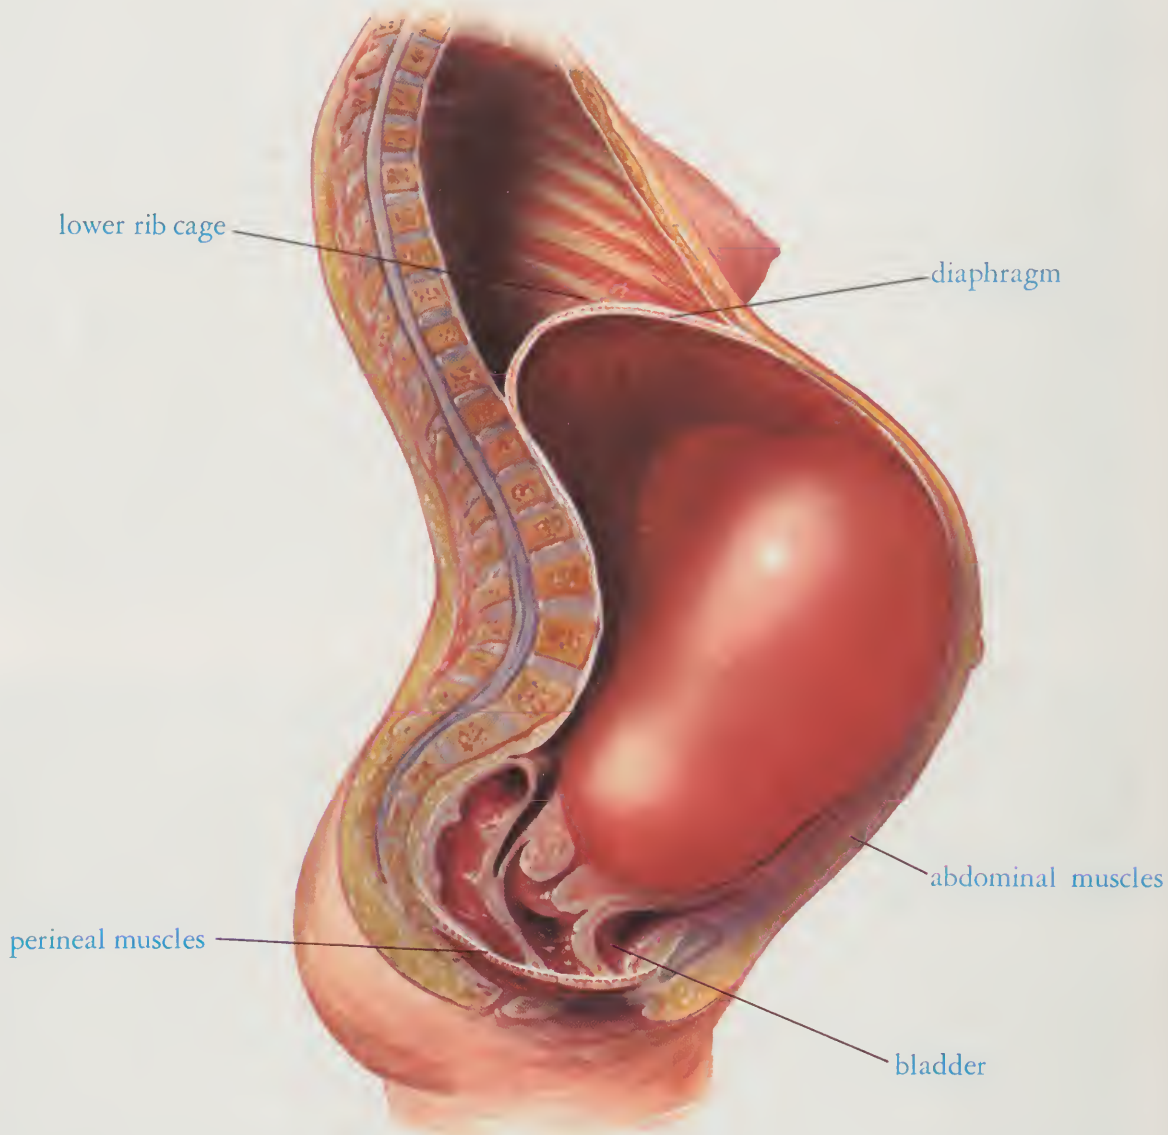
DORSEY Season

A journal within a journal published quarterly in the interests of better medicine by Dorsey Laboratories, a division of The Wander Company, Lincoln, Nebraska 68501. Address communications to Keith W. Sehnert, M.D., Medical Director.

this issue: the cold in pregnancy...



the cold in pregnancy

Frederick W. Goodrich, Jr., M.D.
Senior Obstetrician and Gynecologist, Lawrence and Memorial Hospital, New London, Connecticut

Since pregnancy and the common cold are both ubiquitous, it is not surprising that they often occur at the same time in the same patient. Incidence figures are hard to come by, but the chances are very good that any given pregnant woman will have a cold at some time during the nine months of her gestation. When she does, she will tell you that it is the worst cold she ever had. It seems to last longer and the symptoms are more distressing than they are in the non-pregnant.

For purposes of this discussion, the common cold is considered to be the well-known symptom complex which includes sore throat, stuffy nose, and a cough. Febrile states or extension of the disease process into the lower respiratory tree are not part of the common cold and will not be included in this discussion.

The clinical picture of a cold in pregnancy can be confused by a long-known physiological phenome-

non. Kiesselbach's area in the nose (on the anterior part of the nasal septum above the intermaxillary bone) becomes engorged, apparently due to hyperemia induced by the increased estrogen level which accompanies pregnancy. The amount of congestion can vary in degree from woman to woman. Some have very little congestion, others will have occasional nosebleeds from this area, still others will have symptomatic congestion to the degree that they will complain of having a "chronic" or constant cold.

Less well recognized is the occurrence of this type of hyperemia in any part of the nasopharyngeal mucosa, again in varying degree. Such swelling often produces a postnasal drip which, the patient will state, is present only when she is pregnant. Patients who do not have symptomatic congestion ordinarily, will find that when they do get a cold, the symptoms last much longer than those of a cold usually do. Occasionally, this hyperemia is responsible for closure of the medial end of the Eustachian tube; such patients will complain of "plugging" of the ears. Inspection of the ear drum will show a depression which confirms the presence of Eustachian closure rather than wax in the canal which is the patient's diagnosis. Symptoms related to this physiological congestion are more apt to occur in heavier smokers or those who have a history of allergic rhinitis, just as are the symptoms of the common cold. And when the cold does occur in pregnancy, the symptoms are worse because of the underlying congestion.

The pregnant woman with a cold is miserable for other reasons, dependent somewhat on her parity and the length of her gestation. As parity increases, so also does the relaxation of the abdominal and perineal musculature. The uterus, lying against a slack abdominal wall, and bearing down on relaxed perineal muscles, acts like a piston when the patient coughs, sneezes, or even blows her nose, pushing down on the bladder. Stress incontinence during colds is almost the rule.

As the length of gestation increases, so does the size of the uterus. As it grows, it pushes the abdominal contents above it and elevates the diaphragm. This results eventually in a lateral displacement of the lower rib cage, often to a point at which the patient will complain of soreness in this area. If such a

(Concluded on following page)

From a continuing study on nasal congestion...

timed to work while your patient does

A study begun in 1966 by the Department of Otolaryngology, Greater Baltimore Medical Center, has accumulated evidence that documents the effectiveness of Triaminic's timed-release action in the treatment of nasal congestion.

With its balanced formulation of an oral nasal decongestant and two antihistamines, Triaminic effected partial or complete relief in more than 82% of the 85 subjects treated. Clearing nasal obstruction. Reducing turbinate swelling. Making breathing easier.

It's a comforting thing to know that Triaminic really works.

Triaminic® *timed-release tablets*

Each timed-release tablet contains:

Phenylpropanolamine hydrochloride	50mg.
Pyrilamine maleate	25mg.
Pheniramine maleate	25mg.

Side effects: Occasional drowsiness, blurred vision, cardiac palpitations, flushing, dizziness, nervousness or gastrointestinal upsets. Precautions: The patient should be advised not to drive a car or operate dangerous machinery if drowsiness occurs. Use with caution in patients with hypertension, heart disease, diabetes or thyrotoxicosis.

(Advertisement)

patient has a cold, the coughing and sneezing will exaggerate this soreness. The diaphragmatic restriction caused by the enlarging uterus also makes breathing more difficult, particularly when the patient lies down. A cold compounds this difficulty.

Treating a cold in pregnancy requires two additional considerations. The patient should be told that the symptoms may last longer lest she become discouraged, and she should be reassured that the treatment will not damage the fetus. Although there are still some women who seem blissfully ignorant regarding matters of health (and these need to be cautioned not to take medication recommended by friends), most of our maternity patients are aware of the thalidomide tragedy. These women need constant reassurance that the symptoms of a cold can be treated, and that the medication is safe. Fortunately, many of the drugs which are of benefit have been in use long enough and widely enough so that such a statement can be offered. Occasionally one encounters a patient who is so anxious to avoid medication that she is extremely reluctant to take anything at all. Since cold is self-limited, it seems reasonable enough to give such a patient the choice and not to force drugs on her if she is obviously afraid of taking them.

The most distressing symptom of the common cold is the nasal congestion. This can be mitigated by the use of a decongestant which will help reduce the postnasal drip and the coughing caused by it. The kind of a cough which is described as a "tickling" in the throat and which is apt to occur when the patient goes to bed is usually due to nasopharyngeal congestion rather than inflammation in the lower respiratory tract.

There are many cough mixtures available. Most contain an antihistamine, a decongestant, and a cough "suppressant." Should cough suppression be desirable, it is important to remember not to use both a decongestant tablet and such a cough mixture as the patient would be getting a double dose of the decongestant. With some patients, the placebo effect of a cough syrup may be important and a liquid preparation might be substituted for an oral tablet.

For a sore throat, candy drops or lozenges at frequent intervals are soothing. It is not only unnecessary but unwise to use antibiotic lozenges or drop The use of antibiotics in an uncomplicated cold contraindicated and should be scrupulously avoide

In summary, a cold in pregnancy is more severe an longer lasting. The treatment of the symptoms wit local and systemic decongestants will make th patient more comfortable.

Apparently the cold is so common in pregnancy th it has received very little attention in the literatur References are almost non-existent and the fe which are available add little to the common know edge, are out-dated, or are not helpful. Thus th usual bibliography is not appended.

Relieve his sniffles, her concern, and about half your phone calls. Tell her to get "The Orange Medicine"

Triaminic® syrup

Each teaspoonful (5 ml.) contains:

Phenylpropanolamine hydrochloride	12.5 mg
Pheniramine maleate	6.25 mg
Pyrilamine maleate	6.25 mg

For nasal congestion you can bring quick, lasting comfort to your little patients with Triaminic Syrup. You may occasionally encounter these side effects: drowsiness, blurred vision, cardiac palpitations, flushing, dizziness, nervousness or gastrointestinal upsets. Precautions: the possibility of drowsiness should be considered by patients engaged in mechanical operations requiring alertness. Use with caution in patients with hypertension, heart disease, diabetes, or thyrotoxicosis.

"Breathing's a snap again," he said gingerly.
(COMPLIMENTS OF DIMETAPP)

Help clear up that miserable stuffed-up feeling with Dimetapp. Each hard-working Extentab brings welcome relief from the stuffiness, drip and congestion of upper respiratory conditions for up to 10-12 hours. Yet, patients seldom experience drowsiness or overstimulation. The key to success is the Dimetapp formula: Dimetane (brompheniramine maleate)—along with phenylephrine and phenylpropanolamine, two time-tested decongestants. They get the job done . . . in a hurry.

Indications: Dimetapp is indicated for symptomatic relief of the allergic manifestations of respiratory illnesses, such as the common cold and bronchial asthma, seasonal allergies, sinusitis, rhinitis, conjunctivitis, and otitis.
Contraindications: Hypersensitivity to antihistamines. Not recommended for use during pregnancy.
Precautions: Until patient's response has been determined, he should be cautioned against engaging in operations requiring alertness. Administer with care to patients with cardiac or peripheral vascular diseases or hypertension.
Side Effects: Hypersensitivity reactions including skin rashes, urticaria, hypotension and thrombocytopenia, have been reported on rare occasions. Drowsiness, lassitude, nausea, giddiness, dryness of the mouth, mydriasis, increased irritability or excitement may be encountered.
Dosage: 1 Extentab morning and evening.
Supplied: Bottles of 100 and 500.

Anxiety and tension often "switch on" a multiplicity of physical complaints.

a tranquilizer with particular usefulness in functional disorders

Tybatran™

(pronounced TYE-buh-tran)

brand of tybamate

Extensive clinical experience, including eleven double-blind studies,[1-11] indicates that Tybatran is an effective agent for the relief of anxiety and tension. It appears to lend itself particularly well to the management of the anxious patient who "somatizes"—whose anxiety and tension find expression in complaints such as headaches,[4,8,10,11] fatigue,[4] insomnia,[2,4,8,9,12] anorexia,[3,8,9] and pruritus.[7]

Two salient features seem to set Tybatran somewhat apart from certain other commonly used tranquilizers.

1. Tybatran often proves more effective than meprobamate and chlordiazepoxide. In one study,[4] severe anxiety responded more effectively to tybamate than to meprobamate; in another,[8] symptom-response superiority of tybamate over chlordiazepoxide was marked at statistically significant levels of confidence.

2. Tybatran appears to be less sedating than other widely used tranquilizers. Side reactions are relatively infrequent; when they do occur, they may take the form of drowsiness, although insomnia, ataxia and other adverse effects have been reported. Nevertheless, Tybatran impresses many clinicians by its comparative lack of undesirable sedative action.[3,6,12,13] (If drowsiness or vertigo is present, activities requiring optimal alertness should be avoided.)

For patients in whom anxiety is manifested in any of a multiplicity of physical complaints, Tybatran deserves a clinical trial. These are the challenging patients, those with recurrent, persistent, ever-changing symptoms for which there is no clinical or laboratory evidence of organic disease.

Usual adult dose: one or two 250 mg. capsules 3 or 4 times daily. Adjust to suit individual requirements.

A·H·ROBINS

Prescribing Information

Dosage and administration. The suggested adult dose of Tybatran (tybamate) is one or two 250 mg. capsules three or four times daily. Dosage should be adjusted to suit individual requirements. While clinical experience with Tybatran (tybamate) in children has been very limited to date, the recommended daily dosage for children 6 to 12 years old is 20 to 35 mg./kg. body weight, in three or four equally divided doses. Dosage should be adjusted to suit individual requirements. Until further clinical experience is obtained, administration of Tybatran (tybamate) to children under 6 years of age is not recommended. Daily doses larger than 3000 mg. are not recommended, although in a few instances doses in excess of this figure have been administered. Tybatran (tybamate) is also available in 350 mg. capsules, for convenience in dosage adjustment, e.g., one capsule three times daily and two at bedtime.

Contraindications. Tybatran (tybamate) should not be administered to patients known to be hypersensitive to the drug. Since no studies have been done with this drug in human pregnancy, it should not be used in pregnancy unless the potential benefit outweighs the risk.

Warnings. Simultaneous administration to psychotic patients of tybamate with phenothiazines and other central nervous system depressants has in a few instances been associated with the occurrence of grand mal or petit mal seizures. Seizures have been reported with administration of phenothiazines alone, but not with administration of tybamate alone; nevertheless, tybamate should be used cautiously in individuals who are receiving other central nervous system depressants or have a history of convulsive seizures. Also, it should be borne in mind that simultaneous administration of tybamate with alcohol or with other psychotropic agents, particularly phenothiazines or monoamine oxidase inhibitors, which are known to potentiate the action of other drugs, may result in additive actions.

Precautions. There has been no evidence to date of the development of habituation or addiction. Investigators have not observed excessive self-medication or any withdrawal symptoms with use of Tybatran (tybamate), but the latter should be kept in mind with cessation of the drug after prolonged use. Because of the occurrence of

Prescribing information continued on next page.

(pronounced TYE-buh-tran)

Tybatran™

brand of tybamate

a tranquilizer with particular usefulness in functional disorders

Prescribing information continued from preceding page.

withdrawal symptoms or exacerbation of presenting symptoms upon rapid withdrawal of other agents of this type, abrupt withdrawal of Tybatran (tybamate) should be avoided. Tybamate, like other psychotherapeutic agents, should be used with caution in addiction-prone individuals. Should symptoms of hypersensitivity occur, administration should be discontinued at once and appropriate symptomatic treatment initiated. Operation of motor vehicles or machinery or other activities requiring optimal mental alertness should be avoided if drowsiness or vertigo is present. As with any new drug, Tybatran (tybamate), should be used with caution in patients with a history of drug allergies, blood dyscrasias, and hepatic or renal disease; and prolonged and/or high doses of tybamate should be accompanied by periodic measurements of hepatic, hematopoietic, and renal function.

Adverse reactions. While these have only rarely required discontinuation of the drug, the most frequently encountered reactions have included drowsiness, dizziness, nausea, insomnia, euphoria. The drug was discontinued in one child because of a possible drug-induced urticaria, and skin rash and pruritus have been encountered in a few other patients. In a few patients, effects suggesting excessive stimulation such as hyperactivity, fidgetiness, flushing, and tachycardia have been encountered. Other reported side effects recorded only a few times to date have included ataxia, unsteadiness, confusion, feeling of unreality, "panic reaction," fatigue, headache, paresthesias, vertigo, gastrointestinal disturbances, glossitis and dry mouth. Grand mal or petit mal seizures have been reported in a few hospitalized psychotic patients to whom tybamate (up to 6000 mg. daily), phenothiazines, and other psychotropic agents were administered simultaneously. Convulsive seizures have not been reported with the use of tybamate alone.

Until clinical experience has accumulated with this drug, inasmuch as tybamate is related to meprobamate, the physician should be cautious about the possibility of rare, serious adverse reactions such as may be encountered with the latter drug. Should excessive doses of tybamate be ingested, it is recommended that any drug remaining in the stomach be removed and symptomatic therapy, including central stimulants, be used as necessary.

Supply. Tybatran (tybamate) is available in green, sealed capsules of three strengths: 350 mg., 250 mg., and 125 mg. Each strength is supplied in bottles of 100 and 500.

MEDICAL EDUCATION

Five new medical schools opened during the fall of 1967. Others increased their enrollments of beginning medical students.

The result is an increase of first-year medical students to an estimated 9,280, compared with 8,964 last year, according to the *AMA News*, published by the American Medical Association.

The new medical schools are the University of Arizona College of Medicine, at Tucson; Brown University's Program in Medical Science, at Providence, R.I.; the University of Hawaii School of Medicine, at Honolulu; Michigan State University's College of Human Medicine, at East Lansing; and, Pennsylvania State University's Milton S. Hershey Medical Center, Hershey, Pa.

The five new schools raise the number of U.S. medical schools to 94. Eleven other new medical schools are continuing development programs. By the mid-1970s, medical schools will be graduating about 10,000 students annually.

The *AMA News* warned editorially that the statistics should not be celebrated as marking a solution of medical manpower shortages.

"The American Medical Association's Board of Trustees has stated that while medical school output will continue to increase steadily, the increase will probably not be sufficient to resolve the medical manpower shortage," the editorial said.

"Medical educators know it takes from six to ten years from the time it is decided to build a medical school until the graduation of the first class. It requires a minimum of three years after money is available to develop a medical school to the point where it will enroll its first class."

The five new schools "can serve as inspirations," the editorial said, but they ought to serve as warnings that "the time to act—the time to begin planning and gaining the necessary support for a new school or the expansion of an existing one—is now."

Don't let monilia cut broad-spectrum therapy short...

start with Tetrex-F®

tetracycline phosphate complex-nystatin

Use of broad-spectrum antibiotics can cause fungal overgrowth in the alimentary tract... and give rise to symptoms so troublesome that therapy must be prematurely stopped. Tetrex-F (tetracycline phosphate complex-nystatin) helps you circumvent this problem.

The nystatin can prevent overgrowth of monilia; the phosphate complex delivers tetracycline to the blood rapidly. Side effects are infrequent.

High-Risk Patients

Tetrex-F (tetracycline phosphate complex-nystatin) is especially useful in patients most susceptible to fungal overgrowth during tetracycline therapy: (1) the elderly or debilitated, (2) young children, (3) the diabetic, (4) those on long-term tetracycline therapy, (5) those on steroid therapy, (6) those who have had moniliasis before, and (7) pregnant patients with a history of monilial vaginitis.

When you start with economical Tetrex-F (tetracycline phosphate complex-nystatin), you can complete the full course of broad-spectrum therapy with less chance of losing control elsewhere. A good start for a healthy finish.

PRESCRIBING INFORMATION. For complete information consult Official Package Circular. *Indications:* Infections of respiratory, gastrointestinal and genitourinary tracts and skin and soft tissues due to tetracycline-sensitive organisms, in patients with increased susceptibility to monilial infections. *Contraindications:* The drug is contraindicated in patients hypersensitive to its components. *Warnings:* Photodynamic reactions have been produced by tetracyclines. Natural and artificial sunlight should be avoided during therapy. Stop treatment if skin discomfort occurs. With renal impairment, systemic accumulation and hepatotoxicity may occur. In this situation, lower doses should be used. Tooth staining and enamel hypoplasia may be induced during tooth development (last trimester of pregnancy, neonatal period and childhood). *Precautions:* Bacterial superinfections may occur. Infants may develop increased intracranial pressure with bulging fontanels. In gonorrheal therapy, serologic tests for syphilis should be conducted initially and monthly for 3 months. *Adverse Reactions:* Glossitis, stomatitis, nausea, diarrhea, flatulence, proctitis, vaginitis, dermatitis, and allergic reactions may occur. *Usual Adult Dosage:* 1 capsule q.i.d. Continue for 10 days in Beta-hemolytic streptococcal infections. Administer one hour before or two hours after meals. *Supplied:* Capsules, bottles of 16 and 100. Each capsule contains tetracycline phosphate complex equivalent to 250 mg. tetracycline HCl activity and 250,000 units of nystatin. For Oral Suspension, 125 mg. tetracycline and 125,000 u. nystatin/5 ml., 60 ml. bottles.

On Medical Ethics

Frequently we hear physicians say they are not concerned with the specifics spelled out in regard to medical ethics. To them, practicing medicine according to their own standard of ethics is good enough.

The defensive comment, "I am not bound by what those who have no personal contact with my patients say I should do," is usually the reply to the Faculty's Mediation Committee when a physician has been advised that he has, indeed, been unethical in his dealings with his patients or other members of the profession.

Since the end of World War II, there has been an increasingly conscientious attempt to adequately police violations of ethics and to take action against the small percentage of offenders. The American Medical Association recognized the need for a written code of ethics and directed its Judicial Council to prepare one.

The task has been immense, as the conduct of the physician is subject to more laws, rules and regulations than any other profession in this country today. As a citizen, the physician is expected to obey all of the statutes and court decisions that apply to the public at large; as a specialized member of society, the physician is expected to abide by the provisions of the medical practice act governing the practice of medicine in each of the states; as a member of an organized profession, the physician is expected to abide by a self-imposed code set forth in the Principles of Medical Ethics of the American Medical Association; as a hospital staff member, the physician is expected to observe the rules and regulations promulgated by the hospital staff; and as a member of an old and honored profession, the physician is expected to live up to the public's subjective concept of how a doctor of medicine should look and act.

In a single issue of the JOURNAL, one could not hope to include sufficient materials on each of these aspects of medical ethics and discipline to enable anyone using it to make an exhaustive study of each. The goal of this issue is to furnish guidelines for the activities in which medical associations are engaged and to encourage physicians, active in organized medicine, to review and, where necessary, to make disciplinary practices more effective.

It is not enough for a physician to claim he practices medicine according to his own moral judgment, nor is it enough for a physician to assert he is above the criticism of his peers.

(The material included in this section of the JOURNAL has been excerpted from the American Medical Association's Manual, *Medical Ethics and Discipline,* compiled by the Office of General Counsel, 1965.)

Objectives of the Program on Medical Ethics

To stimulate the interest of the individual physician in the area of medical ethics and to encourage him to make this area more relevant and meaningful in his professional life in order that he may more nearly exemplify the finest traditions of the medical profession.

To improve and make more efficient grievance and disciplinary procedures and practices in all areas of the profession.

To give leadership and guidance to physicians to assist them in resolving moral problems of a professional nature.

To give leadership and guidance to the profession by anticipating and resolving ethical problems before they become acute to the extent that this is feasible and appropriate.

To enhance the understanding of physicians, lawyers, legislators, other public officials, and the public of the Principles of Medical Ethics and Professionalism.

To encourage physicians in all levels of group and organizational activity of a professional nature, to consider relevant ethical principles when formulating policy programs or procedures.

To promote unity in the profession by encouraging all physicians to be more aware of their common bonds of professionalism and by encouraging them to resolve any differences within, rather than without, the profession.

To promote the concept of professionalism within the medical profession and with other worthy professions.

History of Medical Ethics

The earliest written code of ethical principles for medical practice was conceived by the Babylonians around 2250 B.C. That document, the Code of Hammurabi, was indeed a *code* of conduct, setting forth in considerable detail for that era of history the nature of conduct demanded of the physician. Today that code would be subject to criticism because it went into too much detail. It may be doubted that it could have continued, as a practical document, through the centuries because, as medical science and cultural patterns became more complex, it would have required one skilled in jurisprudence to codify and interpret the myriad situations covered by it.

The Oath of Hippocrates, a brief statement of principles, has come down through history as a living and even workable statement of ideals to be cherished by the physician. This Oath was conceived some time during the period of Grecian greatness, probably in the fifth century B.C. It protected rights of the patient and appealed to the inner and finer instincts of the physician without imposing sanctions or penalties on him. Other civilizations subsequently developed written principles, but the Oath of Hippocrates (Christianized in the tenth or eleventh century A.D. to eliminate reference to pagan gods) has remained in Western Civilization as an expression of ideal conduct for the physician.

The most significant contribution to ethical history subsequent to Hippocrates was made by Thomas Percival, a physician, philosopher, and writer of Manchester, England. In 1803, he published his *Code of Medical Ethics*. His personality, his interest in sociological matters, his close association with the Manchester Infirmary, led to the preparation of a "scheme of professional conduct relative to hospitals and other charities," from which he drafted the code which bears his name.

At the first real meeting of the American Medical Association in Philadelphia in 1847, the two principal items of business were the establishment of a code of ethics and the creation of minimum requirements for medical education and training. Although the Medical Society of the State of New York and the Medico-Chirurgical Society of Baltimore had had formal written codes of medical ethics prior to this time, it is clear from the records and the preface to AMA's first adopted Code of Ethics that it was based on Percival's Code.

In general, the language and concepts of the original Code adopted by the Association in 1847 remained the same throughout the years. There were revisions, of course, which reflect the temper of the times and the eternal quest to express basic concepts with clarity. Major

revisions did occur in 1903, 1912, and 1947. In 1947 the language of the chapter dealing with compensation of physicians, contract practice, conditions of medical service, free choice of physician, and purveyal of medical services was redrafted.

In December, 1955, an attempt was made to distinguish medical ethics from matters of etiquette. A draft of a two-part code seeking to accomplish this was submitted to the House of Delegates at that time but was not accepted. This proposal was, in effect, a segregation of then existing statements, found in the *Principles,* into two categories. Little or no change was made in the language of the forty-eight sections of the *Principles.*

Subsequently, in June, 1956, a seemingly radical proposal was submitted to the House of Delegates for consideration. This proposal, a short version of the *Principles,* was discussed at the following session of the House, in December, 1956, after having had wide publication and broad consideration among members of the medical profession. It was then laid over for final consideration at the June, 1957, meeting of the House of Delegates, at which meeting the short version was adopted.

The format of the *Principles* adopted in June, 1957, is a change from the format of the *Principles* promulgated by Percival in 1803 and accepted by the Association in 1847. Ten short sections, preceded by a preamble, "succinctly express the fundamental concepts embodied in the present [1955] Principles," according to the report of the Council on Constitution and Bylaws. That Council assured the House of Delegates in its June, 1957, report that "every basic principle has been preserved; on the other hand, as much as possible of the prolixity and ambiguity which in the past obstructed ready explanation, practical codification and particular selection of basic concepts has been eliminated."

Almost immediately after the 1957 edition of the *Principles of Medical Ethics of the American Medical Association* was adopted, the Judicial Council of that Association expressed its formal opinion that:

> ". . . the 1957 edition of the *Principles* was not intended to and does not abrogate any ethical principle expressed in the 1955 edition of the *Principles of Medical Ethics of the American Medical Association.* The format and language of the 1955 and 1957 editions differ; certain items dealing with professional manners and etiquette have been eliminated. However, the basic ethical concepts they include are identical. Therefore, no opinion or report of the Council interpreting these basic principles which were in effect at the time of the revision has been rescinded by the adoption of the 1957 edition . . . "

PRINCIPLES OF

PREAMBLE

These principles are intended to aid physicians individually and collectively in maintaining a high level of ethical conduct. They are not laws but standards by which a physician may determine the propriety of his conduct in his relationship with patients, with colleagues, with members of allied professions, and with the public.

SECTION 1

The principal objective of the medical profession is to render service to humanity with full respect for the dignity of man. Physicians should merit the confidence of patients entrusted to their care, rendering to each a full measure of service and devotion.

SECTION 2

Physicians should strive continually to improve medical knowledge and skill, and should make available to their patients and colleagues the benefits of their professional attainments.

SECTION 3

A physician should practice a method of healing founded on a scientific basis; and he should not voluntarily associate professionally with anyone who violates this principle.

SECTION 4

The medical profession should safeguard the public and itself against physicians deficient in moral character or professional competence. Physicians should observe all laws, uphold the dignity and honor of the profession and accept its self-imposed disciplines. They should expose, without hesitation, illegal or unethical conduct of fellow members of the profession.

SECTION 5

A physician may choose whom he will serve. In an emergency, however, he should render service to the best of his ability. Having undertaken the care of a patient,

Medical Ethics

he may not neglect him; and unless he has been discharged he may discontinue his services only after giving adequate notice. He should not solicit patients.

SECTION 6

A physician should not dispose of his services under terms or conditions which tend to interfere with or impair the free and complete exercise of his medical judgment and skill or tend to cause a deterioration of the quality of medical care.

SECTION 7

In the practice of medicine a physician should limit the source of his professional income to medical services actually rendered by him, or under his supervision, to his patients. His fee should be commensurate with the services rendered and the patient's ability to pay. He should neither pay nor receive a commission for referral of patients. Drugs, remedies or appliances may be dispensed or supplied by the physician provided it is in the best interests of the patient.

SECTION 8

A physician should seek consultation upon request; in doubtful or difficult cases; or whenever it appears that the quality of medical service may be enhanced thereby.

SECTION 9

A physician may not reveal the confidences entrusted to him in the course of medical attendance, or the deficiencies he may observe in the character of patients, unless he is required to do so by law or unless it becomes necessary in order to protect the welfare of the individual or of the community.

SECTION 10

The honored ideals of the medical profession imply that the responsibilities of the physician extend not only to the individual, but also to society where these responsibilities deserve his interest and participation in activities which have the purpose of improving both the health and the well-being of the individual and the community.

Medical Ethics—Choice for Right

HOWARD A. NELSON, MD

"A PHYSICIAN should be an upright man, instructed in the art of healing . . . modest, sober, patient, prompt to do his whole duty without anxiety; pious without going so far as superstition, conducting himself with propriety in his profession and in all the actions of his life."

Thus did Hippocrates write the first principles of medical ethics more than three centuries before the birth of Christ. In less than 50 words of classical Greek, he established the foundation for nearly all systems of ethics to follow, and in 22 centuries of writing and rewriting men have failed to add or take away a single tenet. The Hippocratic essentials are conduct, obligation, character, and aim.

Time has produced only an interweaving of moral declarations, science, and religion. Nothing really new has been added. This suggests something strangely wonderful about the profession of medicine; the manner in which it is practiced predates, by thousands of years, the science actually practiced. But there is then an important distinction to be made between morality and science. Ethical principles are a priori while science is empirical. But this for many scholars, even those who disagree among themselves, is a meaningful interdependence and not a cleavage. The apriorist calls for a distinction between reason and experience where the former consists of eternal principles of validity not derived from the latter. But experience must include morality. Two contemporary scholars of theology and ethics, Brightman,[1] an empiricist, and Knudson,[2] an apriorist, seem most representative of this view.

The young physician must be no less proficient in the humanities than he is in the sciences if he is to succeed in bringing his career into a rich perspective of character and competence. If he is deficient in either, he is not likely to become the doctor his preceptors are striving to make nor the one an enlightened public expects and demands. There is no documentation to back up this notion, but the chances are that no physician grounded in serious training in ethics, morality, philosophy, and religion will find himself before the medical society grievance committee or the board of censors.

Evolution in systems of medical ethics is virtually limited to matters of statement and application. For 21 centuries, they were individually stated and informally applied. During the past 100 years, medical ethics has become a collectively stated proposition formally applied by the body politic to the whole of the profession. Medicine came of age in the 19th century, and Percival's Principles of Medical Ethics in 1803 preceded the organization of the American Medical Association by only 44 years. Although the historic AMA organizational meeting at Philadelphia in May, 1847, had the primary purpose of improving medical education, the founding fathers took time to adopt the first version of the familiar document.[3]

The present Principles of Medical Ethics of the American Medical Association[4] is not even twice as long as the oath of Hippocrates. It is a brief document of scarcely more than 500 words, a substantial reduction from the old 4,000-word

Principles which existed in essentially the same form for 110 years. The chief difference in the versions is the elimination from the older document of the dicta of etiquette and manners formerly intermingled among guides for moral conduct and professional obligation. There is a word to be said for the old Principles which will be all but lost to the next medical generation. (The Judicial Council of the American Medical Association has published an "abstract of opinion" which reproduces all the sections of the 1955 edition of the Principles, correlating them to the 1957 edition.)

At some point early in his professional career, each young physician should read the older version. This is not a plea to reverse the June 6, 1957, action of the AMA House of Delegates at New York, and return to the old. It is an exhortation to the coming generation of physicians to grasp and hold to everything of possible value which the past can provide. Complex society has made uncertain the navigation channels in the turbulent sea of modern professional pursuits, and the lighthouses of moral guidance are altogether too far apart. No thinking medical leader is thus crusading for a return to the horse and buggy doctor so often lionized in the legend of ideals. This is, conversely, a rare opportunity to draw on the riches of the past, while avoiding its error, and to reap the profits of now-apparent mistakes.

Although remembered historically as a symbol of material splendor, Babylonia apparently gave the world the first formalized expression of medical ethics in the Code of Hammurabi. The celebrated code, engraved on a priceless and magnificent stele, now in the Louvre in Paris, contains 282 sections providing for nearly every legal and moral problem of that ancient society. It even spelled out the physician-patient relationship! And that was as far from Hippocrates as his oath is from the 1957 version of the "Principles of Medical Ethics."

From Hammurabi to Hippocrates to New York is just about the history of the world, but the moral aim of the healer is consistent all along the way. The preamble to the Principles of Medical Ethics states, "These principles are intended to aid physicians individually and collectively in maintaining a high level of ethical conduct. They are not laws but standards by which a physician may determine the propriety of his conduct in his relationship with patients, with colleagues, with members of allied professions, and with the public."

That strength of character is a matter of self-determination obtains with the physician where it fails with others. The Principles are nothing more than a yardstick with which to measure conduct, obligation, and aim. Specifics are generally avoided, giving way to broad guiding principles. Except for eight words in section 5, there is no reference, direct or indirect, to professional freedom. Yet the whole of the document is a declaration of moral freedom—but only freedom to choose the right.

There is never a problem in ethics until the individual is confronted with a choice. Every choice we make commits us to consequences. At the precise instant the choice is made, we reach a point of no return. Some early moral codes provided generously for recalling poor choices through escape and exoneration devices following a determination of guilt.[5]

Roberts tells of a highly respected physician who was sure that lack of scientific medical knowledge had been disastrous to patients he was treating some years previously. The doctor had no fear of punishment and suffered no pangs of remorse because his treatment had been that which the medical profession of the day regarded as correct and acceptable. The doctor had no ethical or scientific alternative.[6] The important question arises, then; what is choice and what kind of situations compel us to make a choice? The answer is both eternal and temporal; morality is eternal, but the conditions of choice are temporal, based on empiricism of existing knowledge. For the ethical physician, there is never a point of turning back nor is there atonement. The choice he makes must stand as his best effort; to do less is to fail ethically.

The 10 sections of the current Principles of Medical Ethics of the American Medical Association deal with medicine's goals of service, improvements in knowledge and skills, and scientific attainment. Further, physicians are exhorted to uphold the dignity and confidence enjoyed by the profession and to safeguard themselves against incompetence within the profession. Responsibility to patients, disposition of services and professional attainment, and sources of income constitute principal ethical limitations. One section

alone is given over to the physician-patient relationship, and a final injunction emphasizes the responsibility of the physician as a citizen and member of society. Sectarian or cultist relationships are strictly prohibited as being unethical.

The first section outlines medicine's aims: "The principal objective of the medical profession is to render service to humanity with full respect for the dignity of man. Physicians should merit the confidence of patients entrusted to their care, rendering to each a full measure of service and devotion."

The words of Hippocrates ring in this simple and direct statement recalling that the physician should be "modest, sober, patient, prompt to do his whole duty without anxiety." It logically follows that in section 2 is demanded a continual striving to improve knowledge and skills, requiring that benefits of all professional attainments be made readily available to patients and colleagues alike. Thus does American medicine have a moral basis for prohibiting secret remedies and techniques; these are devices of the cultist, usually worthless, if not harmful. Not a few national-level organizations in medicine require certain postgraduate education minimums, thus insuring constant improvement of scientific knowledge and skills. Meetings of the county medical society, state medical association, and AMA are devoted principally to this necessary end.

In section 3 it is required that "A physician should practice a method of healing founded on a scientific basis; and he should not voluntarily associate professionally with anyone who violates this principle." This is the ethical basis for separation of cultism from science, superstition from knowledge. It is unethical to associate voluntarily in any manner with a chiropractor, naturopath, osteopath, or other irregular practitioner. Since 1955, when Resolution No. 77 was adopted by the AMA, the Judicial Council has held it unethical to associate voluntarily with an optometrist.[7]

One of the four cardinal hippocratic principles is specifically covered in section 4, which states, "The medical profession should safeguard the public and itself against physicians deficient in moral character or professional competence. Physicians should observe all laws, uphold the dignity and honor of the profession and accept its self-imposed disciplines. They should expose, without hesitation, illegal or unethical conduct of fellow members of the profession."

This injunction as to the physician's character raises the question of freedom of choice. More a matter of semantics than of morality, there is no question of being bound or free—only the question of by what the ethical physician shall be bound.[8]

Section 5 contains the only statement of freedom of choice permitting that "a physician may choose whom he will serve." Exception is made to provide for emergencies, and the ethical practitioner is enjoined against neglect of a patient once care has been undertaken. He may discontinue his services, apart from discharge by the patient, only after giving adequate notice. Solicitation of patients is forbidden.

Oddly enough, the sternest requirements of moral and legal responsibility are interwoven with the single statement of freedom. This is the one section of the Principles relating directly to most statutory provisions on patient neglect as well as that of patient solicitation through advertising or other public dissemination of self-laudatory information.

Generally, the basic unit of medical organization—the county medical society—exercises the greatest latitude in interpreting this section. Precisely what constitutes advertising, patient solicitation, and self-laudation is best determined at the local level. Appellate prerogatives are reserved to the state medical association and AMA Judicial Council. The practice of local determination and definition of these unwholesome practices is not to say that the state association is without prerogative of original hearing and ruling; there are many instances where this has, indeed, been done.[9]

Corporate practice and exploitation of a physician through employment arrangements are primary subjects of interest in section 6. It is stated, "A physician should not dispose of his service under terms or conditions which tend to interfere with or impair the free and complete exercise of his medical judgment and skill or tend to cause a deterioration of the quality of medical care."

This has been one of the most difficult portions of our system of ethics to interpret and enforce. Many physicians feel that the statement is vague and less than definitive. This lack of definition, however, permits state associations to examine problems in light of local conditions and permits

them to elaborate upon that principle for the guidance of its membership. For example, the Mississippi State Medical Association works through its House of Delegates. This House of Delegates has made the following statement:[10]

> It is essentially undesirable for professional services to be purveyed by hospitals, corporations, and/or political subdivisions where fees for services are involved either from the patient or a responsible third party except for those statutorily established and medically accepted programs of government which are not disapproved by the association.
>
> Reasonably expeditious and conscientious effort should be exerted by all physicians to provide medical services privately, whether gratuitiously or paid, in a climate of free choice, where possible.
>
> Patience and indulgence should characterize the efforts of all concerned to achieve these objectives without unnecessary delay. Litigation and the development of profound differences of viewpoint which, when publicly exposed, tend to lessen confidence of the people in the American system of medical care should be scrupulously avoided.

"In the practice of medicine," section 7 states, "a physician should limit the source of his professional income to medical services actually rendered by him, or under his supervision, to his patients. His fee should be commensurate with the services rendered and the patient's ability to pay. He should neither pay nor receive a commission for referral of patients. Drugs, remedies, or appliances may be dispensed or supplied by the physician provided it is in the best interest of the patient."

Here is the one reference to the economics of medical practice in this entire system of ethics. Previously, the older and longer version had a number of references, especially with respect to financial gain being a subordinate objective to that of service. It must be noted that there is no ethical taboo against the dispensing of drugs and appliances, but there is a strong qualification that such action must be in the best interest of the patient. Formerly, dispensing was generally held as unethical; practical experience has demonstrated that this former restriction was not always in the interest of the patient.

Sections 8 and 9 require the exercise of moral judgment by the physician in the pursuit of scientific activity. The former requires that a physician seek consultation upon request, in doubtful or difficult cases, or whenever it appears that the quality of medical service may be thereby enhanced. Here is a situation where the physician must make a qualitative evaluation in ethical judgment.

Section 9 makes it incumbent upon a physician not to "reveal the confidences entrusted to him in the course of medical attendance, or the deficiencies he may observe in the character of patients, unless he is required to do so by law or unless it becomes necessary in order to protect the welfare of the individual or of the community."

Finally, in the Principles of Medical Ethics the physician is required to have a balance of conscience and a proper investment of emotional and civic capital. It states, "The honored ideals of the medical profession imply that the responsibilities of the physician extend not only to the individual, but also to society where these responsibilities deserve his interest and participation in activities which have the purpose of improving both the health and the well-being of the individual and the community."

Perhaps the best commentary would be to say simply that the doctor must also be a citizen. It is good advice to the doctor for him to seek the ideal balance in community and professional living which avoids an exaggeration of moral consciousness just as it does that of incompetence. The heritage of medicine is rich, but the exacting requirements on the disciples of a sometimes inexact science make doctors servants of a "jealous mistress."[11]

To give your career to medical science, you must give your life to morality and dedication.

Medical Ethics and some of its Problems

HOMER L. PEARSON, MD

From the very beginning of the practice of medicine, physicians have adhered to certain ethical concepts even before they were expressed and reduced to writing. This has been true because medical ethics are basically the same as the ethics for any other homologous group of people working together in a common cause. They differ only in specialized particulars concerned with the service or activity which may be unique to a particular group and of little or no concern to another.

Ethics are principles. They represent generations of experience by trial and error. As such they are blueprints for the practice and behavior of the individuals who make up the group. They distill the best of the past, sustain the needs of the present and point to the possibilities for improvement of the future.

All too frequently of late a distinction was being made between conduct that was "unethical" and conduct that was "contrary to the Principles of Medical Ethics." Such rationalization is erroneous. All men are guided by the same ethical principles and conduct is ethical or unethical as it is or is not in accord with basic principles. The reason for principles of medical ethics is to accent basic, universal and permanent ethical principles which have particular application in the practice of medicine. They do not carve out exceptions to basic ethical concepts.

While it is said with some truth that the honest, conscientious doctor does not need a written code of ethics, it must be admitted that one can act from a right conscience only if he has a right conscience. And it must be recognized that there are occasions when conscience may be doubtful.

The high opinion in which the profession is held by the public is due in large measure to the wholehearted manner in which the great mass of physicians have conducted their professional life in accordance with the accepted Principles. The Principles have always stressed that the duty of the physician is to his patient. They remind him of the full responsibility that is his, once he has accepted the patient. They also point out that the physician is free to choose whom he will serve but that he also should respond to any request for assistance in times of emergency, or whenever public opinion expects the service.

The tragedy is that there are a few doctors who put aside any idealism they might have had, and work only for their own financial betterment. It is this small group that aids in stimulating the growth of insidious, indiscriminate smearing of doctors as a class and the general disparagement of all of our profession's ideals.

While hundreds of doctors do thousands of dollars worth of work without receiving any fee, there are a few who overcharge the patient. This group fails to realize that by making money their supreme goal, they are cutting off their own nose. They don't realize that sooner or later it will become known that they indulge in sharp practices, and their patients will lose trust in them and go elsewhere. However, as a well-known surgeon said many years ago, "Let us brush the dust of hypocrisy from our knees and admit that learning is, in part a commodity." Most of us depend upon this commodity for our living and

we thus earn our daily bread. While we earn our daily bread, however, we can see to it that our conduct is such that it will not bring criticism on ourselves or on our profession.

We have our faults and our virtues. We meet with failures and achieve successes. Many of our faults are entirely unavoidable and arise from the fact that medicine is not an exact science. We must recognize our limitations; we must be able to distinguish between what we know and what we simply guess; we must be able to recognize the essential and fundamental from the non-essential and accidental; we must cease to confuse vague hypothesis with established fact.

Sir William Osler said, "Let the doctor pay heed to his education and ethics and his reputation will take care of itself." This philosophy is one followed by the vast majority of physicians and pays rich dividends in the end. Today, more than ever before, medicine is in the public view. We see it on TV and in the magazines and daily press, and hear about it on radio. Much of this is good but a certain amount is stimulated by aggressive, irresponsible individuals who would like to destroy the very system upon which the free practice of our profession is based. There is a great deal of unrest, and predictions of the future are constrained and narrow. This means that it is more important than ever that the physician adhere to his ideals.

It is this sort of idealism which has always led the public to rank medicine with the ministry. Like the minister, the physician has the traditional moral responsibility of "going the second mile"—of rendering care over and above the call of duty, to rich and poor, just and unjust, friend and foe alike.

Medical ethics face their greatest crisis when the young man or woman leaves college. The world of actual practice gives them a rude shock.

The young doctor quickly learns that in the practical affairs of life, ethics and economics overlap. His idealism leads him to place ethics first. His desire for economic gain often sets up a sharp conflict of purposes. Nowhere is this relation between ethics and economics closer than in medicine; nowhere are the issues between the two more important.

There are a few important points that seem to lead to confusion in the minds of many physicians and laymen alike. Most of our problems originate in the area where ethics and economics tend to overlap.

Free choice of physician is an expression used to reflect at once both an economic and an ethical principle. Simply, it means that it is the inalienable right of the patient to choose the doctor he prefers and to change physicians when he feels he is not receiving satisfactory medical care. Obviously the application of this right is not absolute. Natural factors limit it. There may be only one physician in a community. Or, the physician chosen may not choose to accept the patient. Civilians, for example, cannot choose Army doctors.

These limitations of application must be kept at a minimum. Arbitrary or economic limitations on the patient's exercise of his inherent right to choose his physician are detrimental to the patient's medical welfare.

The areas in which we have the greatest problem are in the case of certain panel groups employed by some insurance plans and by certain industrial groups.

There are many industries which choose certain doctors in a given area to care for their employees in that area.

The industry being of the opinion that if they are paying for the service they have the right to make the choice. There are many variations to this situation but all have to do with "free choice." It is my opinion that to choose your own doctor is your inherent constitutional right to be exercised, or not, as you wish.

The public, forgetful that all that glitters is not gold, tends to accept without critical evaluation any new service or product if it is sufficiently publicized and promoted. It is prone to accept proposals claiming professional services can be obtained wholesale, according to the practices of the commercial world.

Members of the medical profession do not believe that professional services can be bought, sold, packaged, stored, delivered, appreciated or depreciated, as a commodity in trade. Members of the medical profession, however, subscribe to the principle that the prime objective of the profession is to make medical service ever more readily

available, and always available to him who needs it regardless of cost.

Both medicine and the public desire the same end and thus it is strange that misunderstanding arises as to the end that is sought. The public is impatient. It wants to take the time element out of orderly social and professional development. Medicine, more critical of the end sought, is more critical of the means used to reach that end and is more patient. Doctors, and perhaps lawyers too, know how important time can be.

To the medical profession "free choice of physician" is a fundamental issue. To some of the public and to some public figures this is said to be a selfish shibboleth; and some commercially minded interests are ridiculing the concept. Although the issue is primarily an economic one it has ethical overtones.

Perhaps there has been a failure of communication between the medical profession and the public it serves. The same type failure may plague you and your profession as social planners tell the public how your professional services should be made available, not according to professional ideals, but according to laws of the market place.

Physicians have not found in their collective experience that the quality or quantity of medical care increases when some third party chooses the individual's physician. Physicians have found that the intervention of a third party may disrupt the intimate, close, personal relationship which is so important to both the art and science of medicine. In this area the concept of free choice has ethical implications.

MEMBERS of the medical profession know, as the public should know, that good medical care cannot result when a designated doctor is limited to giving the patient only what the patient paid for. Medicine must give what individual independent professional judgment dictates.

Our Principles of Medical Ethics recognize that we cannot and may not dispose of our professional services under terms or conditions which tend to interfere with or impair the free and complete exercise of medical judgment and skill or tend to cause a deterioration in the quality of medical care.

The matter of free choice of physician has another aspect which should be of interest to you. In a limited, special sense medicine is competitive. But the competition is cooperative and altruistic. Each doctor competes with himself and with his colleagues so that each procedure is an improvement over the last. As professional men, you recognize the sense of this competition. You agree it is an intangible but integral component of professionalism.

Where this idealistic and healthy competition flourishes, the art and science of medicine flourishes. This competition flourishes in the United States. The principle of free choice, the knowledge that a patient has chosen you, stimulates and actually forces improvement. If you need proof of this just recall that the medical centers of Austria, Germany, England, and France, where a patient's choice has been limited, no longer stand preeminent. Today's doctor does not go to Vienna or Paris for post-graduate work. He comes to your community in the United States.

The right of a patient to choose his doctor, within normal limitations, is one of the vital contributing factors to the status of leadership acquired by the medical profession in the United States. The sum total of all practice of all doctors accounts for the stature of the profession. Free choice exercised countless times, every day effectively prevents the individual doctor from resting on his laurels and past achievements. It lifts the entire profession through the collective achievements of its members.

Medicine's job today is to re-awaken the public to the importance of this concept. At the moment, commercially minded groups, social planners, do-gooders, and others are promoting wholesale medicine, promising that a package deal will save money and provide security. Patients are like clients. They listen to rosy promises without thought of the cost they pay. The money they save will be of little worth if health has been sacrificed to obtain it.

The division of fees, or fee splitting, is another area in which we have difficulty. Our ethics adhere to the principle that you should not collect money for something you did not do. Such a principle could well be adopted by all professions and trades. We can look around us everywhere and see people getting paid all out of proportion to the amount of work they do and in fact getting paid for no work at all.

It is unethical to stand in with the surgeon at the

operation in order to get part of the fee for assisting. It is, however, right to be present at the operation and charge a fee if the patient requests the physician to be there and to visit her following the surgery. This fee must be separate and distinct from that of the surgeon. There are all sorts of ways to juggle a patient, most are unethical.

Then there are rebates, kickbacks, commissions, etc. the practice of which is unethical and if left unnoticed can well get out of hand. This practice can be manipulated in various ways. For example, a druggist might offer to pay office rent if the physician channels all prescriptions through his drugstore. A group or clinic with a building may rent to a druggist on a sliding rental scale. The rent depending upon the profit made by the druggist on the prescriptions from the group. A firm which grinds lenses and makes glasses may give a rebate to the ophthalmologist who prescribes the glasses. In like manner, the orthopedist who prescribes braces, corsets, artificial limbs, crutches and the like may receive a rebate from the appliance manufacturer. All these things are unethical because if it were permitted the temptation would be for the doctor to send his patients not where they could get the best service for the least cost but to the company who would give him the largest kickback. To give the doctor a good rebate it would be necessary to charge the patient more for his prescription or appliance.

Advertising is another area in which physicians are misunderstood and have difficulty. The Principles of Medical Ethics do not proscribe advertising as such; they proscribe the solicitation of patients. Advertising in its broad sense means the action of making fact, information or intention known to the public. Solicitation as used in the Principles, means the attempt to obtain patients by persuasion or influence. The public is entitled to know the names of physicians, the type of their practice, the location of their office, their office hours and the like. The doctor may ethically furnish this information through the accepted local mediums of advertising which are open to all physicians on like conditions. Telephone listings, office signs, professional cards, dignified announcements—all are acceptable mediums of making factual information available to the public.

The public is eager to hear and learn all it can of the most recent advances in the cure of diseases that so far have baffled the efforts of men to cure; it is eager to hear of the brilliant operations by which men have seemingly been saved from certain destruction and brought back to useful existence. It is anxious to learn and put in practice the best methods of public hygiene and preventive medicine. The public press has correctly considered such subjects as news, as that is what interests its daily readers, but the medical profession has been placed at a disadvantage . . . we must realize that if the AMA endeavors to arouse public interest in medical matters and increase the knowledge of public health and hygiene, with this increased knowledge will come a demand for more knowledge concerning the various diseases which may be acquired by any individual. The daily press has a right to publish that which is of interest to its readers; hence it has a right to a knowledge of medical matters that shall be accurate and given by honorable men. On the other hand; there is every reason why the medical profession shall keep up its barriers against the self-advertising of individuals for selfish purposes.

By purveyal of medical services we mean the providing of medical services by a third party for profit to himself at the expense of the doctor, or the profiteering on medical care by a third party. This third party may be a person or a hospital or a corporation.

With regard to the practice of medicine by corporations it is our opinion that such practice is detrimental to the best interests of scientific medicine and of the people themselves. When medical service is made impersonal, when the humanities of medicine are removed, when the coldness and automaticity of the machine are substituted for the humane interest inherent in individual service and the professional and scientific independence of the individual physician, the greatest incentive to scientific improvement will be destroyed and the public will be poorly served.

The Judicial Council believes that the remedy for the evils associated with contract practice resides in the county medical societies. These societies should use influence and power not to condemn the physician who must take the contract by ostracizing him but to prevent underbidding for these contracts below what would give fair reward for medical services rendered.

Medicolegal

Code of Cooperation

Preamble

Acknowledging that substantial part of the practice of law and medicine is concerned with the problems of persons who are in need of the combined services of a lawyer and a physician; that the public interest and individual problems in these circumstances are best served only as a result of cooperative efforts of all concerned; that members of both the legal and medical professions share an obligation to the individual and to society, we the members of the Maryland State Bar Association, the Baltimore City Bar Association and the Medical and Chirurgical Faculty of the State of Maryland, do adopt and recommend the following declaration of principles as standards of conduct for attorneys and physicians, in interrelated practice.

Adopted September 11, 1964, by the House of Delegates of the Medical and Chirurgical Faculty of Maryland. Also adopted by the Baltimore City Bar Association and the Maryland State Bar Association, 1964. Amended and Adopted by the Baltimore City Bar Association and the Maryland State Bar Association, July, 1966. Adopted as amended by the Medical and Chirurgical Faculty on September 9, 1967.

Medical Examinations and Reports

1. *Authorization of Patient Required:* A physician shall furnish to any person, any information concerning the history, physical condition, diagnosis or prognosis of the physician's patient only upon the signed authorization of the patient (or, in the case of a minor, of the minor's parent or guardian), or where authorized by law.*
2. *Reports to Patient or his Attorney:* The patient, or his attorney, upon written request, when accompanied by a signed authorization from the patient, shall be entitled to a prompt report from the attending physician, containing the history, physical condition, diagnosis, and prognosis, but need not include an evaluation of the disability in Workmen's Compensation Cases. The physician's fee for such a report should be commensurate with the time and effort devoted to its preparation.
3. *Request for Report:* When a medical report is requested of a physician, whether he be an attending physician, consulting physician, or examining physician, the lawyer requesting the report should make clear in his request the specific information desired; should disability evaluation and the prognosis be desired, the lawyer should so specify.
4. *Examination of Adverse Party:* Where there has been an examination of an adverse party, the examining physician shall not furnish to the person examined or his attorney or anyone else other than the person arranging for the examination a copy of his report or any information concerning his findings on such examination. The examining physician, acting for a party adverse to the person he is examining, should, where taking a medical history, attempt to elicit only such facts as are pertinent to his examination.
5. *Referrals by Attorneys:* Attorneys are cautioned not to refer a patient under treatment to another physician for examination, consultation or treatment without the knowledge of the physicians involved. The physician to whom the patient is referred may be guilty of a breach of ethics if he accepts a patient for examination, consultation or treatment without the knowledge of the treating physician.

* Examinations made in Workmen's Compensation Cases fall in this category.

Medical Testimony

1. *Conference Before Trial:* In order that the patient and client may have his case properly presented to the Court or other tribunal and to see that justice is done, it is the duty of each profession to present fairly and adequately the medical evidence in legal controversies. To arrive at that end pre-trial conference between the lawyer and the physician regarding medical testimony is encouraged and recommended. The members of each profession shall do their utmost to co-operate with the other in arranging a time and place satisfactory to both for such a meeting.
2. *Subpoena for Physician, Conference:* A subpoena should not be issued to any physician without prior notice and conference with such physician, where possible, concerning the matters regarding which he is to be interrogated, unless the physician and the lawyer agree that such conference is unnecessary.†
3. *Cooperation with Court:* It is recognized that the proper and efficient dispatch of the business of the courts cannot depend upon the convenience of litigants, the lawyers or the witnesses, including physicians who may be called to testify; both the lawyer and the physician should recognize, accept and discharge their obligation to aid and co-operate with the courts in the presentation of medical testimony.
4. *Arrangement for Court Appearance:* In arranging for the attendance of a physician at a trial or other legal proceeding, the lawyer should always have due regard and consideration for the professional demands upon the physician's time, and accordingly, the lawyer should, whenever possible, give the physician reasonable notice in advance of his intention to call the physician as a witness, and of the probable date on which the physician will be expected to testify.‡ The lawyer should also advise the physician to bring with him to court such records as the lawyer or the physician may need for the proper presentation of the

† Careful preparation of a case requires that the lawyer issue a subpoena for each important witness including physicians. A lawyer should explain to the physician that the issuance of a subpoena for the physician is in accordance with the standard practice of procuring physicians as witnesses.

‡ It must be understood that the lawyer does not control the date of trial in any case since this is a matter in the sole control of the court.

physician's testimony. Furthermore, during the course of the trial the lawyer should endeavor to keep the physician advised from time to time as to the approximate hour when he will be called to the witness stand; and upon the physician's appearance at the hearing at the hour agreed upon the lawyer should endeavor to arrange with the court for the prompt calling of the physician to the witness stand.

When arrangements are later cancelled for the court appearance and the physician has cancelled his regular appointments, he shall, nevertheless, be entitled to be paid a reasonable fee.

5. *Fees for Expert Testimony:* A reasonable expert witness fee is a proper and necessary item of expense in litigation involving medical questions. When a physician is called to testify as an expert witness he should be paid such expert witness fee as may be agreed upon between the physician and the lawyer calling him. In every instance in which the lawyer makes arrangements for expert testimony it shall be the duty of the lawyer to see that the physician is paid his fee.
6. *Contingent Fees:* Neither the physician called as a witness nor the lawyer so calling him shall invite or enter into any arrangement whereby the making of a charge for the physician's appearance as a witness or for the giving of testimony, or the amount of any such charge, shall be contingent on the outcome of the litigation or on the amount of damages awarded in the case.
7. *Physician Called as Witness:* The attorney and the physician should treat one another with dignity and respect in the courtroom. The physician should testify solely as to the medical facts in the case and should frankly state his medical opinion. He should never be an advocate and should realize that his testimony is intended to enlighten rather than to impress or prejudice the court or the jury.

   It is improper for the attorney to abuse a medical witness or to seek to influence his medical opinion. Established rules of evidence afford ample opportunity to test the qualifications, competence and credibility of a medical witness, and it is always improper and unnecessary for the attorney to embarrass or harass the physician.

Payment for Medical Services Rendered

Upon final disposition of any case wherein services rendered by a physician are involved, the lawyer shall forthwith notify the physician of such disposition and upon the receipt of the physician's bill and an order from the patient to pay the same direct to the physician, the attorney shall use every reasonable effort to see that the physician's bill is paid forthwith. The attorney shall make no charge to the physician for any services rendered in connection therewith. Unless otherwise agreed, the primary responsibility for payment of medical expenses rests with the client-patient.

Committee on Interprofessional Relationships

For many years the Medical and Chirurgical Faculty of the State of Maryland and the Maryland State and City of Baltimore Bar Associations, recognizing the need of a committee composed of both physicians and lawyers for the purpose of promoting a closer and more harmonious relationship between the two professions, have designated annually a group of physicians, now (12) twelve, to work with a corresponding number of lawyers (agreed upon and appointed jointly by the two Bar Associations).

The subcommittee on interprofessional relations of the said Joint Committee of 24, which subcommittee is composed of 4 physicians and 4 lawyers, who shall be designated by the chairmen of the respective groups and shall annually select its own chairman alternately from the medical members and the legal members; it shall consider all matters concerning interprofessional relationships between these two professions, including but not limited to the following:

1. Promotion and perpetuation of harmony between the professions.
2. Achieving a fuller understanding of mutual problems.
3. Consideration of legislation affecting medical-legal professional relationships.
4. Hearing of grievances stemming from interprofessional relationships.
5. Referral of grievances to the Medical and Chirurgical Faculty of the State of Maryland or the Bar Association concerned where that committee deems such reference warranted.

Physician/Patient Relationship

The legal profession recognizes that the practice of medicine is a hazardous task and that it is obviously not always possible for the physician to obtain a good result even with the best of attention and professional skill, and that an unfortunate result does not indicate in itself that the physician did not exercise the highest degree of skill and attention in the treatment of the case; and that a lawyer should not undertake to make any claim against a physician without thoroughly investigating the essential facts and details and being reasonably certain that if a harm has been done a patient, that it was due to genuine carelessness or negligence or lack of professional skill as distinguished from honest difference of opinion or the difference in honest judgment in a particular case. It should, nevertheless, also be considered that by the Canons of Professional Ethics the lawyer owes devotion to the interest of his client, warm zeal in the maintenance and defense of his rights, and the exertion of his utmost learning and ability, and that the client is entitled to the benefit of any and every remedy and defense that is authorized by law, and he may expect his lawyer to exert every such remedy or defense.

The medical profession recognizes that there are cases in which the patient suffers injury as a result of negligence, carelessness, or lack of professional skill on the part of a physician and that in these cases, there should be just compensation to the injured person. That in cases of this character, it is as much the duty of a physician-expert to assist the injured person as it is the duty of a physician-expert to defend a fellow-physician when he is proceeded against improperly.

General Provisions

Nothing contained in this Statement of Principles is intended to be inconsistent with the rules of law, Canons of Ethics of the local, state and national Bar Associations, and the Principles of Medical Ethics of the American Medical Association.

Physician/Pharmacist

Code of Cooperation

Preamble

Acknowledging that the practices of medicine and pharmacy need the combined services of both groups, this Code of Cooperation is hereby adopted as a declaration of principles of conduct for the two professions to follow. It is clearly understood that local laws, regulations and Codes of Ethics of both professions clearly take precedence over these principles of conduct.

It is the hope of the two professions that the adoption of this Code of Cooperation will result in an improved understanding and closer relationship between the professions of medicine and pharmacy in the interest of better health care.

Adopted by the House of Delegates of the Medical and Chirurgical Faculty of the State of Maryland and the Maryland Pharmaceutical Society's Executive Committee on October 12, 1967.

Physician

The American Medical Association's Code of Ethics states, in part:

"It is not unethical for a physician to prescribe or supply drugs, remedies or appliances as long as there is no exploitation of the patient."

Notwithstanding this statement, the Medical and Chirurgical Faculty of the State of Maryland believes that drug dispensing by physicians should be discouraged if adequate pharmaceutical service is available. A physician's professional source of income should be from the services he renders to his patients, and only from this source.

Physicians collectively, through the Medical and Chirurgical Faculty, recognize the following:

1. A patient should be permitted the free choice of his pharmacy, just as he should be permitted free choice of physician.
2. Physicians should not advise a patient as to the charge for professional pharmaceutical service.
3. The physician should cooperate with a pharmacist by specifying the number of times a prescription is to be refilled, and by making himself available to the pharmacist to determine whether or not his original orders should be altered after the original number of refllls has been obtained. A prescription should never be marked for a refill contrary to current laws or regulations.
4. Physicians may, at their own discretion, indicate on the prescription order they write, that the prescription label include the name of the drug ingredients, as well as any other information deemed necessary. This is an individual decision and one that will depend upon the expert judgment of the physician based on the patient as an individual. (House of Delegates, 5/64).
5. Physicians should not dispose of drug samples to pharmacists for any consideration, either direct or indirect. The use of drug samples in a physician's practice should be done in a manner that recognizes the position of the pharmacist in his role as a provider of drugs to the public. It is the responsibility of the physician to dispose of any undesired drug samples only through destruction, disposition to charitable organizations or through the approved program of the Woman's Auxiliary of the local medical societies. In no event should such drug samples be disposed of in a manner that would permit their falling into the hands of unauthorized persons.
6. Physicians should not enter into any rental, ownership or financial agreements or any other activity with pharmacists that would directly or indirectly affect the prescribing of medication by a physician in favor of a particular pharmacy or pharmacies.
7. The patient is always entitled to a written prescription. It is recognized, however, that it is permissible for a physician to prescribe by telephone to pharmacists of the patient's choice rather than writing prescriptions out individually.
8. Sale of drug samples either to patients or others, which have been given free to physicians, is to be condemned. In general, complimentary drugs should be used only as starter doses. (Council, 11/21/1961)
9. Mail order prescriptions are condemned, as this method of handling vital prescription matters would seem sharply at variance with the detailed, personal, professional care so essential to the safe distribution of prescription drugs. (House of Delegates, 9/14/62)
10. The use of prescription blanks imprinted with the name of a pharmacist, pharmacists or pharmacy is specifically prohibited by law.
11. Physicians are free to use either the generic or brand name in prescribing drugs for their patients. However, physicians should consult with the pharmacist as a member of the medical team in order to assure that the patient is properly served by being provided with medication of the highest quality.
12. Physicians should not write prescription orders in "code."
13. Physician's bills should include only those charges for professional services rendered by him or under his supervision.
14. When prescription blanks are not imprinted with a physician's name, his name and degree should be printed or typed legibly below his signature.

Pharmacist

Recognizing that pharmacists and physicians must work as a team, the pharmacists, through the Maryland Pharmaceutical Association—the state professional pharmaceutical society—hereby adopt the following principles: It is understood that the foregoing principles for physicians, insofar as they affect the profession of pharmacy are also subscribed to by the profession of pharmacy. It is also understood that some of these principles are presently incorporated in Federal and State laws and regulations as standards and requirements for pharmacy practice.

Pharmacy recognizes the inestimable value of the professional pharmacist to the health team, encourages him to fulfill completely the professional requirements of his calling, and desires that he decrease his activities in commercial enterprises which presently may be associated with but are not and should not be related to the practice of pharmacy.

1. Pharmacists, as well as physicians, are obligated to serve the public whenever their services are needed. On nights, Sundays and Holidays prescription services should be readily available in cases of emergency.
2. The pharmacist should never diagnose or prescribe, even at the insistence of the patient but should refer those needing medical attention to a physician of the patient's choice.
3. The sale of proprietary products and home remedies that have been approved by the Federal Food and Drug Administration for over-the-counter sale for self-medication shall not be considered counter prescribing by the pharmacist.
4. In an emergency, or preceding arrival of the physician, the pharmacist will render such emergency treatment as is indicated by his training, experience, scientific knowledge and good judgment.
5. If there is any question in the pharmacist's mind regarding the ingredients or labeling instructions of a prescription order, possible error, or safety of the drug, he should privately and tactfully consult the physician before making changes and never discuss it with, or in the presence of, the patient.
6. There should be no substitution of ingredients by the pharmacist, and he should follow the prescriber's directions in the refilling of prescription orders. If no refilling instructions are contained on the original prescription, the pharmacist should not, in accordance with law, refill such prescriptions without the authority of the prescriber.
7. The pharmacist should not discuss the composition of a prescription or its therapeutic effects with the patient except when in the best interest of the patient he finds it necessary to identify or differentiate medication. When such questions arise he should tactfully suggest that the prescriber is the proper person with whom such matters should be discussed.
8. The pharmacist shall be responsible for providing a comprehensive supply of drugs on which the physician may draw by prescription order for the treatment of his patient and serve as a source of information on new drugs and their combinations in order that the physician and his patient may have the advantage of the latest pharmaceutical developments.

General

Neither physicians nor pharmacists should approach each other with respect to the completion of illegal arrangements such as a pharmacist working as an employee of a physician. Pharmacists shall not engage in, and physicians shall not accept, advertising of a pharmacy in a physician's office or waiting room.

The physician has a responsibility to make clear to the patient that even though a specific drug may be expensive, it is the best therapeutic agent he feels can be administered in treating the condition of the patient. Pharmacists, in turn, should not comment on the efficacy of the drug prescribed or of a substitute drug.

Publicity in connection with professional activities of either pharmacists or physicians should be cleared through the appropriate professional group. In all cases, news or feature stories affecting both professions should be developed cooperatively by the two groups.

Addition: The Council of the Medical and Chirurgical Faculty of the State of Maryland at its September 7, 1967 meeting voted to adopt the following recommendation:

Approved the policy that prescription blanks printed for physicians after January 1, 1968, *not* contain *printed* information indicating refills.

Statement on Report on Protocol on Registered Nurse Responsibilities and Duties as Related to the Medical Practice Act

A major concern of nurses and of the professional nursing organization is related to the professional and legal scope of their practice in the administration of medications and treatments prescribed by a licensed physician or dentist (the dependent area of nursing function).

The American Nurses' Association has encouraged liaison activities between state nurses' associations and state medical societies to study problems occurring within the dependent area of nursing function in order to arrive at joint policy statements on any procedures under question. The American Medical Association has encouraged such liaison activities. In June, 1965, a Nursing Liaison Subcommittee of the Liaison Committee of the Medical and Chirurgical Faculty of the State of Maryland became formal.

The Report on Protocol on Registered Nurse Responsibilities and Duties as Related to Medical Practice Act is the outgrowth of a survey of practices within the dependent area of nursing function conducted by an Ad Hoc Committee of the Maryland Nurses' Association and the Hospital Council of Maryland in conjunction with the Maryland Nurses Association Committee on Professional Nursing Practice in 1964. This brief report, of course, does not cover all areas of dependent function in nursing.

The Maryland Nurses' Association views the report as constituting guidelines for further definition and policy development within individual institutions and agencies. It is implicit 1) that the registered nurse performing these acts shall have received formal theoretical instruction and supervised clinical practice and shall have demonstrated proficiency in performance satisfactory to the medical and nursing staffs: 2) that she act under *written* orders of a licensed physician or dentist; and 3) that she act under *written* policies established by medical, administrative, and nursing staffs.

Although the physician, hospital, or agency assumes responsibility for acts delegated to the nurse, she must always be aware that she is still responsible for her own acts.

Registered Nurse Responsibilities and Duties

as Related to Medical Practice Act

Preamble

Discussion took place on procedures now performed by nurses and the desirability of their being in scope of practice of medicine and still being practiced by registered nurses, under the order of a licensed, registered physician who assumes full responsibility for the act. Specific permissions and restrictions may be made by the local medical staff in each hospital in the state. Generally, if the act performed by the registered nurse is basically mechanical, not requiring the exercise of medical judgment, and is done by order of or supervision by a physician, it is legal.

The following suggestions were made on the items listed, provided by the Maryland Nurses Association:

Report on Protocol on Registered Nurse Responsibilities and Duties as Related to Medical Practice was adopted by the Executive Committee of the Board of Directors of the Maryland Nurses Association on July 23, 1965, with the addendum contained in the statement on the preceding page. Adopted by the Council June 17, 1965.

1. *Initiation of external cardiopulmonary resuscitation and artificial respiration [mouth-to-mouth or mouth-to-nose]*: This would be done as a first-aid measure, and any person adequately trained and accepted as qualified to do it would normally proceed with such action. Nurses should have a training program for the persons who perform this service. They should also be taught protective measures in training to prevent contracting a disease such as tuberculosis, syphilis or meningitis.

2. *Administration of investigational drugs:* This would be done on orders of a physician, with permission of the patient (consent form), and approval of the medical advisory committee or board at the hospital.

3. *Administration of subcutaneous infusions*: Approved administration by nurse, with orders of a physician.

4. *Vena puncture*: Approved administration by nurse, with orders of a physician.

5. *Administration of intravenous a) Fluids, b) Blood, c) Medications, d) Medications added to fluids:*

(a, c) The procedure and specific fluid must be ordered in writing and signed by a licensed physician.

Wherever the professional Registered Nurse is working, the medical, nursing and administrative staffs should establish written policies which clearly and specifically state the conditions under which the professional Registered Nurse may administer intravenous fluids.*

The following shall be included in the written policies:

- The specific requirement for instruction and supervised practice. A requirement that the
- Administration of intravenous fluids and medications by professional Registered Nurses be performed under medical supervision.
- A requirement that a current roster of nurses who have had sufficient supervised practice and instruction and who have demonstrated satisfactory ability to perform the procedure be included.
- A current list of specific solutions which a professional Registered Nurse may administer and of specific drugs which he or she may add to the solution. This list should be reviewed and revised at designated intervals.
- Provision of continuing in-service education.

(b, d) The above policies should apply to transfusions of whole blood and/or blood derivatives. In those situations where whole blood or blood derivatives must be administered by a nurse, it is imperative that the nurse work directly under medical supervision, *preferably the hospital Pathologist or physician who has been appointed in charge of the Blood Bank.*

---

*Approved by the Executive Committee on February 22, 1966.

Explanation of Terms

Supervised practice and instruction: It is not feasible to construct one specific instructional pattern for use in the many and varied existing agencies. Instruction should be based on a formal course which teaches the principles of intravenous therapy and provides enough supervised practice to insure the development of sufficient skill for safe performance of the procedure.

Professional Registered Nurse: A graduate of a professional school of nursing, currently registered by the Maryland State Board of Examiners of Nurses.

Intravenous Administration: Introduction into a vein where the procedure involves vena puncture by needle but does not involve incision into or incision to reach a vein.

Medical Supervision: A physician is immediately available.

6. *Removal of inter-cath (indwelling intravenous catheter):* Approved administration by nurse.

7. *Deep intratracheal suction*: No, should be anesthesiologist, or anesthetist under the direction of anesthesiologist.

8. *Administration of anesthesia during labor:* No, should be anesthesiologist, or anesthetist under the direction of anesthesiologist.

9. *Vaginal examination during labor:* Approved on order of physician.

10. *Rectal examination during labor:* Approved on order of physician.

11. *Removal of sutures:* Approved on order of physician.

12. *Suture of minor lacerations:* No—unqualified.

13. *Exchange fluids in peritoneal dialysis:* Qualified—yes.

14. *Performance of tracheotomy:* No—unqualified.

15. *Insertion of gastric tubes:* Approved.

16. *"Milking" chest tubes to keep them open:* Approved.

17. *Interpretation of electrocardiograms:* No—unqualified.

18. *Substitute for the pharmacist in his absence:* The night nurse supervisor is authorized to utilize the services of the pharmacy under the following conditions *

*Adopted February 15, 1966 by Liaison Committee of the Medical and Chirurgical Faculty of Maryland.

a. The pharmacist must provide an emergency pharmaceutical kit containing drugs necessary for the peculiar or particular needs of the hospital from the time the pharmacist leaves the hospital until he returns.

b. An appropriate record shall be kept in the pharmacy which the nurse shall sign, showing the name of the drug withdrawn, the exact amount of each dose, and the total amount of each drug withdrawn.

c. For any drug not included in the emergency pharmaceutical kit, the pharmacist should be called and should provide emergency service in the procurement and the dispensing of the drug required.

19. *Application of pressure bandages to control hemorrhage:* Approved.

10. *Operation of intermittent positive pressure machine:* Approved, if properly trained.

21. *Care of the patient with cardiovascular diseases in coronary care or intensive care units:* The Med-Chi Faculty and Maryland Nurses' Association recognize the propriety of registered nurses using monitoring, defibrillating and resuscitative equipment. In addition, under certain conditions it is appropriate for registered nurses to institute life-saving corrective measures—if the licensed physician is not immediately available and if all other conditions below are adhered to: *

- The Registered Nurse must have had a special and intensive course of instruction in the above techniques and have the knowledge necessary for her to perform these duties safely.
- Registered Nurses may be allowed to perform these procedures in line with policies carefully stated and voted on by the medical group responsible for the care of patients in the specific hospital.
- These techniques should be carried out only by licensed professional nurses who are working in Coronary Care Units or an Intensive Care Units.
- Only nurses who have demonstrated that they are capable of performing these tasks may be designated to do so.

*Adopted by the Council of the Medical and Chirurgical Faculty of Maryland on June 8, 1967.

Laboratory Services

On May 28, 1964, the Liaison Committee established the Laboratory Services Subcommittee to "consider laboratory services as they related to the general public health and requirements of the people of Maryland."

Three meetings of the subcommittee have been held and a letter addressed to all state health departments in the United States, asking for information with respect to the operation of clinical laboratories in their state. The response to the query was very gratifying but, in general, most states seemed to have little regulation except for serology tests. In view of this the subcommittee was of the opinion that it must develop its own ideas in this area. (Adopted by the Council, June 17, 1965.)

Guides for Ethical Conduct

The Subcommittee feels that with the full cooperation of the medical profession and others concerned, a program can be maintained in Maryland obviating the need for legislation to enforce rules which basically call for ethical conduct. The medical profession has guides for the development of such a program in the *Opinions and Reports of the Judicial Council of the American Medical Association*. The tenets of this document, subscribed to by all medical societies in the United States, basically point out that an unearned addition to a fee for a laboratory test constitutes an unethical practice and further suggest that direct billing by all who render service is the most desirable method.

The first recommendation of the Subcommittee is that all component societies of the Faculty thoroughly review the aforementioned document, that such a review be held in a regular meeting of the medical societies for all members.

Clinical Laboratories

It is recognized that clinical laboratories both in and out of Maryland perform tests for Maryland patients. It is the feeling of the Subcommittee that adequate supervision by competently trained individuals is necessary in every laboratory.

The best interests of the patient are uppermost in the physician's mind; therefore, the laboratories best equipped, both with personnel and equipment, should be used to perform the tests needed. The necessity for the highest quality of work in performing laboratory tests is without question. It is the feeling of the subcommittee that all physicians should assure themselves that the tests being performed for their patients meet the highest standards. By education of the medical profession and other disciplines involved, it is felt that any laboratories now doing substandard work would be forced to meet the demands of the public by providing higher quality work.

Laboratories in Physicians' Offices

The subcommittee recognizes that certain physicians maintain laboratories in their offices for the convenience of their patients. This statement in no way reflects negatively on this practice. These laboratories should maintain the same high quality of performance, and the recommendations are equally applicable to them as to all physicians.

Education

It is the recommendation of this subcommittee that all disciplines concerned with this matter establish a program of education of its members regarding an ethical program based on the tenets of the *Opinions and Reports of the Judicial Council of the American Medical Association,* which interprets in detail the *Principles of Medical Ethics of the AMA.*

Such a program should include the material contained in this subcommittee report which supplements to a certain degree these Principles.

Billing

A contractual agreement between the laboratory and the physician is not in the best interests of the patient. The absence of a contract will eliminate the possibility of a conflict of interest for the physician. In addition, such an agreement makes it difficult, if not impossible, to conform to the principles of direct billing, since a true cost cannot be determined for a specific test under a contract which allows a sliding scale of fees depending on the volume of tests performed.

Conclusions

In order that the highest standards of work be performed in clinical laboratories in Maryland and that the highest quality of laboratory services be made available to the citizens of Maryland, the subcommittee recommends that the following guidelines be established.

1. Laboratory medicine is the Practice of Medicine and should be practiced only in laboratories owned (except in licensed hospitals and governmental facilities), operated, and professionally adequately supervised by licensed and registered physicians.
2. It shall be considered proper for a physician to send to any other physician of his choosing an announcement that he has opened an office, changed the location of an office or changed the professional composition of his office for the practice of medicine, in the format approved by the Medical and Chirurgical Faculty. Return forms that serve only to facilitate the communication between the interested physician and laboratory but do not in themselves give specific information, such as fees, office hours, special qualifications, other than membership in professional Board or Societies, are acceptable. Fee schedules and other specific information material may be sent only to those physicians who request them or who *regularly utilize* the facilities of the laboratory.
3. It shall be considered unethical for:
   (a) A lay employee, directly or indirectly, to solicit work from physicians.
   (b) To advertise laboratory services in any media such as magazines, journals, newspapers, etc.
   (c) To display any advertising material on vehicles.
   (d) To distribute mailing containers except on request.
4. Whenever any physician collects fees for laboratory services which are not performed by him or his regularly employed assistants, the opportunity exists for him to split the fees and to receive income to which he is not entitled; therefore, all billing should be done by the laboratory billing the service. If a clinician and a laboratory share the responsibility for a laboratory procedure, each should send a bill for services rendered. No physician should be denied a reasonable fee for obtaining a specimen for testing purposes and/or interpreting the results of the test, but this should be itemized separately and appear on the physician's statement.
5. It shall be considered unethical for any physician to:
   (a) Submit specimens to any laboratories not owned (except in licensed hospitals and governmental facilities), operated and professionally adequately supervised by a licensed and registered physician.
   (b) Bill for laboratory services not performed by him or his regularly supervised employed assistants.
   (c) Send specimens to any laboratory rendering laboratory services at a flat fee (so-called contractual agreements).

(d) Share income from laboratory services directly or indirectly with any lay person.
(e) Offer laboratory services under a fictitious name.
(f) Offer laboratory services for the care of patients as a corporate structure.
(g) Have a financial interest in any clinical laboratory where the physician is not personally and professionally responsible for the quality of the work performed in the laboratory.
(h) Collect fees from any insurance company for laboratory services not performed by him or his regularly employed assistants.

6. The subcommittee also recommends that, with the approval of the Liaison Committee, these recommendations involving the question of professional ethics should be submitted to the Faculty's Mediation Committee for endorsement and approval and final submission to the Council for its approval as Faculty policy.

The Nature of Blood Banking

From the selection and bleeding of a donor to the administration of his blood as a transfusion, the two main pertinent processes comprise: (1) blood banking—obtaining the blood and its storage, processing, and issue; and (2) transfusion service—its selection, preparation for, and administration to an individual person. These two processes may occur either in close proximity both in time and place, or at great distances in place, variable but limited separation in time. This report takes into consideration, primarily, the first of these processes, blood banking. Blood banks are of three general classifications: hospitals, community, and commercial.

Professional Medical Interest and Responsibility

The attending physician holds uppermost in mind the welfare of his patient. Individually, it is impossible for him to take precautions that blood transfused on his orders is reasonably safe from harming the patient. These precautions can be undertaken through the collective expression of professional ethics incumbent upon his fellow physicians. This concept involves a series of professional responsibilities. The potential harmful effects of transfused blood are so varied that the selection of donors and all subsequent steps must be retained under ethical, medical professional supervision. It is on the basis of these considerations that professional associations have issued statements of policies and principles as follows:

1. American Association of Blood Banks Standards for a Blood Transfusion Service, Fourth Edition, 1964
   (a) All phases of the selection of blood donors and of the collection, storage, processing and transfusion of blood shall be the responsibility of a qualified, licensed physician with a thorough knowledge of blood bank methods and of transfusion principles and practices.
2. College of American Pathologists, 1964 Directory
   Statement of Principles Relating to the Practice of Pathology
   (a) Whereas, The Practice of Pathology is defined as pathologic anatomy and clinical pathology, including such subdivisions as clinical chemistry, clinical microbiology, hematology, diagnostic radioisotopes, exfoliative cytology, blood banking, clinical microscopy, and other related disciplines, and
   (b) Whereas, Pathology is recognized as the practice of medicine by statutes of various states, courts of law, and organizations such as the American Medical Association and the College of American Pathologists . . . Therefore be it
   (c) *Resolved,* That contracts or agreements between pathologists and institutions must be in accord with the requirements of law and with the codes of ethics and statements of principles of the American Medical Association and of the College of American Pathologists; and be it further
   (d) *Resolved,* That such contracts or agreements must preclude the sale of the services of a pathologist by institutions, organizations or nonmedical persons, for a fee; . . .
3. American Medical Association, Judicial Council Opinions and Reports, 1964. Section 6.

RELATION OF PHYSICIANS AND HOSPITALS

"A physician should not dispose of his professional attainments or services to any hospital, corporation or lay body by whatever name called or however organized under terms or conditions which permit the sale of the service of that physician by such agency for a fee . . ."

Practical Considerations

The quantities of blood required for transfusion have greatly increased in recent years because of the development of techniques for surgery of the heart, blood vessels, and respiratory organs, the care of acute injuries, and for other therapeutic purposes. Increased knowledge of the hazards of tranfusion have tended to limit the use of transfused blood, but further knowledge in this field and its dissemination and application are needed. Nevertheless, demands for increased amounts of blood for transfusion are expected. To meet these demands, if the medical profession should take the attitude that blood for transfusion is a commodity rather than a professional service, commercial enterprises can be expected to undertake, as has already been started, the procurement and banking of blood as a profit-making endeavor. Unless ethical, medical supervision can be maintained over all aspects of blood banking, the reliance by attending physicians on blood for transfusion is unsound. Therefore, your committee believes that every blood bank of any type must operate only under full authority of an ethical, licensed physician, who is, thereby, professionally responsible. The arrangements for his remuneration should be such as to preclude his providing medical services for the profit of a non-medical agency.

Conclusions

In order to attain optimum standards of medical care, your subcommittee recommends the adoption of the following principles:

1. The practice of blood banking constitutes the practice of medicine requiring full supervisory authority and responsibility of a licensed physician.
2. Any physician who allows his name and professional status to be used by a noncommercial blood banking agency without first assuring himself that he has full professional authority over the operations of the agency, and without actually assuming the professional responsibility for the products of the agency, is to be considered an unethical practice until it is otherwise demonstrated.
3. It shall be unethical for a physician to allow his name and professional status to be used by or receive remuneration from any blood bank operated primarily as a commercial enterprise.
4. All licensed and registered physicians, particularly members of the Medical and Chirurgical Faculty of the State of Maryland, should encourage and support ethical agencies for the provision of blood for transfusion, in order to guide, under medical supervision rather than commercial or non-medical supervision, the provision of the amounts of blood necessary for proper medical care.

Use of Terms Medical Center or Medical Clinic

The committee was of the opinion that the terms *medical center* and *medical clinic* bring a wide difference of opinion as to their meaning. In the instance of the term *medical center,* it felt that this was of no real significance and that no formal action was necessary insofar as designation of what constitutes a medical center.

The use of the term *medical clinic* also brought forth a wide divergence of opinion as to its meaning. The committee, therefore, is of the opinion that some definition should be provided to members of the Faculty for their guidance. The committee recommends that the definition of *medical clinic* as defined by the AMA be used and that this use be disseminated to the Faculty members for their information. This definition is as follows:

Diagnostic Clinic

The name "clinic," because of its association with the earlier uses of the term, implies a very superior service by very superior individuals. This is frequently not the case. If the American Medical Association is to define a diagnostic clinic, it must be done in a way that will represent the efficiency that modern scientific progress has made possible to the doctor of medicine who has kept abreast of that progress and the idealism or ethical principles that for hundreds of years have been our most cherished heritage as a profession. The Council submits the following as its opinion of a proper definition of a diagnostic clinic:

1. A diagnostic clinic is an organization of physicians whose sole work in the clinic is to make or supervise diagnostic examinations of patients referred to the clinic by doctors of medicine, or to collaborate in general diagnostic surveys.
2. The reports of the diagnostic clinic on examinations and tests are made only to the referring physician unless he requests that the case and the recommendations for treatment be discussed with the patient as a part of a professional consultation at which time the relationship of the results of the diagnostic studies to the general condition of the patient is open for discussion. In such case, discussion is only by a member of the staff.
3. The staff of the diagnostic clinic should include representatives from all the specialties that are of recognized diagnostic usefulness. Every clinical examination, laboratory test or X-ray procedure is made by a physician who specializes in that field or under his supervision. The clinic must be equipped to allow the various specialists to exercise fully their abilities.
4. The control of the clinic must be vested in one or more members of the professional staff. Any profits are to be apportioned only to the members of the staff actually engaged in the work of the clinic. There must be no dividends, bonuses or salaries paid any individual except for services rendered.
5. The clinic must be governed in its activities by the same ethical principles as apply to any individual member of the American Medical Association.

It is recognized that under this definition only in cities large enough to support the various specialists needed can a diagnostic clinic be established or maintained. Unless the specialists are available it is not a diagnostic clinic worthy of the name. (AMA House of Delegates, 1939)

From report of the Policy and Planning Committee. Adopted by the Council, June 17, 1965.

Modification of AMA Specialty Listings for use in Yellow Pages of the Telephone Directory

Policy on Telephone Directory Listings As Approved By Council, November 16, 1967.

Recognizing that a single, statewide policy should be in existence with respect to physician listings in the "yellow pages" or classified telephone directory listings, because many telephone books cross over political subdivision lines, the Mediation Committee recommends adoption of the following policy:

1. Listings shall be made under the heading Physicians and Surgeons. It is understood that where a physician has a specialty that warrants listing under another heading, this is permissible (such as Clinical Laboratories).
2. Listings may include the following ONLY:
   name, address and phone number; office hours; an "if no answer" number; "physicians" or "surgeons" home address and telephone number;
3. Listings may be made ONLY as follows:
   practice limited to ..... (Using only those specialties approved by the American Medical Association or as modified and approved by a special liaison group to be named by the Faculty to work with the C & P Telephone Company)
4. Listings must be uniform in size and type face
5. Display or box advertisements are strictly prohibited
6. Listings may not be carried in a telephone directory where a physician does not have an office or residence, except in combined area directories where a listing may be published in all three yellow page directories, viz., Washington, Maryland Suburban, Virginia Suburban, Baltimore City, Baltimore Suburban West, Baltimore Suburban East.
7. It is preferable for physicians to list the letters "MD" following their name rather than the title "Dr." preceding their name, inasmuch as this leaves no doubt that the person listed is a medical doctor. At times, other types of "Doctorates" can be listed in error.
8. Where multiple offices of a physician are listed, each office listing MAY NOT be preceded by the words "Physicians Office." The same applies to any other category of listing that might arise.
9. The Medical and Chirurgical Faculty may list, in the Metropolitan Baltimore area, a telephone number where the public may call to receive assistance in selecting a physician.
10. Items 2, 3, 4, 6, and 7 apply also to telephone directory listings in the White pages.

* * * *

1. Substitution of following words, rather than those shown in AMA Specialty Listing:
   (a) Diagnostic Radiology rather than Diagnostic Roentgenology
   (b) Ear, Nose and Throat rather than Otolaryngology
   (c) Eye, Ear, Nose and Throat rather than Otorhinolaryngology
   (d) Proctology, rather than "Colon and Rectal Surgery"
   (e) Separation of specialties, "Obstetrics" and "Gynecology," if the physician wishes to pursue only one of these areas
   (f) Eye rather than Ophthalmology
2. Physicians may use only one specialty and may not state items such as "General Medicine and Cardiovascular," "Internal Medicine and Gastroenterology," "Internal Medicine and Endocrinology"
3. Clarification on use of expressions such as:
   (a) Rosedale Medical Group
   (b) Perry Hall Medical Center
   (c) Central Medical Center
   (d) Franklintown Medical Center
   (e) Industrial Accident Clinic

PROFESSIONALISM

There is great emphasis on professionalism today. Professional status is sought after; professional people constitute a growing proportion of the labor force; and an impressive percentage of the gross national product is devoted to the training of professionals.

In spite of this emphasis on professionalism and the common usage of the term, there is no universally acceptable definition. The essential characteristics of the professions are poorly known by the general public. The research on the nature and functions of the professions in modern society has resulted primarily from the efforts of the sociologists. Yet, even among sociologists theoretical and methodological consensus is not yet so great that there is any absolute agreement on the definition of the professions.

Traditionally, there have been three recognized professions: medicine, law and theology. All three are characterized as occupations having the service of man as a goal. The attraction of the three has been not the love of the reward that can be gained in terms of material acquisitions; but rather, the altruistic goal of service to others.

There are certain essential attributes of professions on which general agreement ordinarily is possible. The more important of these are: the obligation to study and acquire knowledge in order to engage in the practice of the profession; primary orientation to the community interest rather than to individual self-interest; a high degree of self-discipline standardized through codes of ethics voluntarily adopted and enforced by the professional group itself; and a system of rewards signifying work achievement and thus a goal in itself, rather than a means to some end of individual interest.

Medicine has been characterized as the queen of the professions. In medicine, personal judgment in the application of technical competence is required to a high degree, since the information at the physician's disposal must be applied to individual cases, each of which differs in some respect from all other cases. The profession of medicine carries a high responsibility which cannot be fulfilled without specialized education. And yet, academic achievement is not sufficient as a guarantee of professional competence. Licensure is required in addition.

Medicine traditionally has had two principal means by which to guarantee to the public that it is performing its function. The first is strengthening the great graduate centers of education which are the sources of research and teaching. The second is strengthening the professional association and its internal disciplinary procedures against all forms of less-than-professional practice. The trend now has the vast majority of American physicians embracing the thesis that by being their professional brother's keeper they are keeping their art pure and holy.

There are many pressures on physicians as professionals today. Rapid changes in contemporary society through technological developments have complicated the physician's life. New knowledge is being accumulated so rapidly that no individual physician can keep up with the entire field of medicine. Patterns of urbanization and mobility resulting from technological advances further complicate his life. The number of people to be helped requires different practice arrangements and new economic patterns change the opportunity for profit. Standards of professional behavior appropriate a century ago tend to become outdated.

Homo Medicus Americanus

JAMES HOWARD MEANS

The character which the doctor of medicine has assumed in the United States today is the subject of our inquiry. The behavior pattern of any profession does not develop overnight; it takes time to evolve. Its characteristics and configuration are formed by its environment and its heritage, as are those of a species in the course of its evolution.

To understand fully the doctor in the United States today, we must know something of his past. How did he get to be the way he is? He and his medicine, of course, came first from Europe. Medicine of the 16th and 17th centuries was rather medieval in character. Authoritarian since the time of Hippocrates (460-377 B. C.), it had finally run into scholasticism and intellectual stagnation. In addition, it had probably declined somewhat in quality in the process of exportation from the Old to the New Worlds. It is unlikely that those doctors who were well established in the Old World would have left their comfortable practices to settle in an unknown wilderness.

Those intrepid medical souls who did venture to cross a dangerous ocean and invade a hostile continent, accompanying other pioneers and settling where they pleased, probably were distributed fairly adequately with respect to need. In New England, at least, some of these men were members of the Puritan clergy who, having resolved to migrate to America, took the precaution of also obtaining a medical education before embarking, thus equipping themselves to care for the bodies as well as the souls of their flocks in the wilderness. All of these doctors had their heritage of Old World medicine to guide them, but what had that to offer them in their new circumstances? Some elementary knowledge of anatomy, physiology and materia medica, a bag of drugs and a few technical gadgets of one sort or another were their equipment. Their method of practice was highly empirical. They purged, they puked, they sweat and they bled, especially the last, all on the basis of tradition rather than of experience or of scientifically proven fact. Their drugs were chiefly medicinal herbs, generically called "simples," which they also used in accordance with accepted custom. They could do very little for their patients beyond relieving certain symptoms and bestowing comfort and moral support.

In the early days, the colonies were swept by one deadly epidemic after another, all imported, in the face of which the doctors were helpless: smallpox, measles—very deadly in those days—scarlet fever, plague, typhus, diphtheria and many others. These epidemics at least left behind a considerable number of immune survivors, whose presence in the community tended to slow up the rate of spread in subsequent epidemics. Until 1800, when vaccination to prevent smallpox was introduced by Dr. Benjamin Waterhouse, who got his vaccine directly from Edward Jenner, there was no specific way of controlling these pestilences. However, attempts to block their importation by the establishment of quarantines at the ports began as early as 1648. These restrictions were perforce imposed by government, and thus we may say that the principle of governmental responsibility for the safeguarding of health was established.

European-trained doctors of medicine were few and far between in the early settlements, and as the population in the new country expanded, they became in short supply. It is said that between 1620 and 1650 about 25,000 English settlers arrived in New England, after which they largely stopped coming. Probably the doctors stopped as well as the rest, yet the population doubled every

25 years from its own growth potential. For a continuing supply of doctors the colonists were obliged to train their own by the apprentice system or to send some of their young men of promise to Europe to obtain proper medical education in the great centers of learning. Increasing numbers of the more gifted and privileged of these students followed the latter course, or perhaps a combination of both courses—first an apprenticeship at home followed by a visit abroad for truly learned instruction, or vice versa. This pattern continued to be followed until well into the 19th century. To walk the wards of the great European hospitals afforded an opportunity to see and learn about all manner of diseases and the treatment thereof, a practical clinical* experience obtainable at that time nowhere else in the world.

With the arrival of the 18th century, progress in American medicine became more perceptible. Practitioners of considerable distinction began to appear, most of them, but not all, located in the larger cities and towns. The wars which beset America in the 18th century called forth a flock of surgeons to attend the wounded and thus gave great impetus to surgery in America.

American medicine, however, could not have survived indefinitely on the momentum imparted by Europe. It had to develop its own medical institutions on this side of the Atlantic before a truly indigenous medical profession could come into being. Medical schools were the prime necessity, for without them no physicians or surgeons could be adequately qualified. The first of these was established in Philadelphia by the University of Pennsylvania in 1765; in New York City, King's College (later Columbia University) founded one in 1767. Harvard University founded a medical school in Cambridge, Massachusetts, in 1783, and the College of Philadelphia did likewise in Philadelphia, Pennsylvania, in 1790. Dartmouth College started a two-year school in Hanover, New Hampshire, in 1798, and Yale University started its medical school in 1813 in New Haven, Connecticut.

* The words "clinic" and "clinical" can be confusing to the nonmedical person. Derived from the Greek word meaning "bed," they came to be applied to a patient in a bed, and finally to anything having to do with patients whether in bed or out of it. Thus "clinical" means having to do with patients, and "clinic" denotes a place where patients are cared for. We speak of clinical medicine to mean practical medicine—diagnosis and treatment of patients—in contrast, for example, to laboratory medicine or public health medicine.

But medical schools alone, in which instruction is given largely by lectures, are far from sufficient for the education of good practical physicians and surgeons. Hippocrates himself insisted that the training of the physician should be primarily through personal observation of patients. It is in hospitals that patients can be had for teaching purposes in the greatest abundance and variety. In the English colonies in North America, no hospital was available for such a purpose until the Pennsylvania Hospital in Philadelphia, of which Benjamin Franklin was one of the founders, opened its doors in 1756.* A teaching hospital was set up in New York (the New York Hospital) in 1791, and another in Boston (the Massachusetts General Hospital) in 1821. These were the first of the so-called voluntary hospitals in the United States, and with their establishment American medical education can be said to have been launched.

In a learned profession, if it is to remain learned, there must be free interchange of ideas among its members. All knowledge must be shared. Agencies for the discussion of professional knowledge beyond the medical school level become indispensable. The facilities needed to meet these requirements are chiefly medical societies, medical journals and medical libraries. In the latter part of the 18th century, there was a great burgeoning of medical societies in North America—state societies, county societies and societies for various local and special types of medicine. These societies were where doctors gathered to exchange experiences, to argue things out with one another. They provided a form of intellectual sharpening which Sir William Osler called "brain dusting"—not to be confused with the present-day term "brain washing"—without which the attainment of professional excellence is impossible. Doctors took to it with avidity and gusto.

Finally in 1848 a national medical society emerged, which was the creation of a congress called together for that purpose by the Medical Society of the State of New York. All medical societies and schools of medicine in the country were invited to send delegates. This national body took the form of a superstructure federating the

* Both French and Latin American colonies were ahead of us in establishing hospitals. For example, Cortez founded a hospital in Mexico City in 1524, and the Hotel Dieu was founded in Montreal in 1644.

state medical societies, and chose the name of American Medical Association—the AMA. The original intent was that it should be democratic in character, patterned somewhat after the nation itself.

In the beginning the AMA's avowed purpose was "to initiate reforms to correct the deplorable condition of medical education which then prevailed." Its establishment was a very important event in the history of American medicine, for it was the beginning of "organized medicine," so-called, and it made the American doctor an organization man. We cannot, therefore, understand him without knowing something of his societies, which determine much of his behavior. They have made him a conformist and a conservative to a considerable extent. Through the years, the AMA has gained steadily in political power. It has learned that through collective action it can exert great political pressure effectively to further the ends favored by its leadership. It has become oligarchic rather than democratic in character.

The establishment of native medical schools and teaching hospitals inevitably had a profound effect upon the nature and quality of American medicine and on the direction and speed of its progress. In the beginning the schools were flimsy affairs and a very far cry from the multimillion-dollar university medical centers of today. They were nonetheless their precursors. The facts that these schools required faculties, and that these needs for the most part be trained in Europe, provided a strong stimulus to the improvement of medical scholarship in the United States. A great many of these early professors were actually trained in Edinburgh, some in London, and a bit later, many in Paris.

The 19th century saw many scientific discoveries and technological advances in the practice of medicine. It was the time, especially in France, of the great clinicians. It also saw the beginnings of our principal preclinical sciences of today—physiology, biochemistry, histology, pathology, bacteriology, immunology and pharmacology. These subjects, which constitute the usual first and second year subjects of the modern American medical school, had their initial greatest effulgence in Germany, and also to a considerable degree in Britain. Even the United States at this time had its William Beaumont, a great pioneer in the physiology of digestion. Also, although there has been much controversy as to who discovered ether anesthesia, no one can contradict the fact that it was an American contribution. About this time another discovery was made by an American doctor, that by Oliver Wendell Holmes of the infectious nature of puerperal or childbed fever. Thus the United States began to contribute on its own account to the progress of scientific medicine and was no longer solely dependent on Europe for advancement in the basic sciences.

The last two decades of the 19th century were the time in American medicine when the great clinicians were paramount. In the United States they reached their ascendency before the medical scientists reached theirs. It was also a time when the private practitioner was in his glory. The vast majority of doctors of medicine in the United States in the 19th century and into the 20th derived their livelihoods exclusively from fees received from private patients for services rendered. They became segregated into categories in accordance with their aptitudes and preferences. In rural areas there were the country doctors, who were general practitioners and family doctors. They had immense self-reliance and would undertake to do nearly anything. When they ran into problems they could not handle, they called in consultation doctors better equipped than they were themselves. The education of these men was usually inadequate. To a considerable extent they got their training on the job, in their own practices. Many of them were products of proprietary medical schools, of which there were many in the 19th century. The faculties of these proprietary schools were practitioners who voluntarily banded together, called themselves a faculty, offered instruction consisting largely of lectures, and financed the affair by the tuition fees they collected.

These general practitioners and family doctors worked hard and developed wonderfully good relations with their patients and families of patients. They made endless house calls, day or night, driving long distances over the countryside in their horse-drawn vehicles, and saw many patients in their offices, which were usually located in their own homes. When patients required bed care, the doctor usually looked after them in their homes. Only rarely did he send them

to a hospital, of which there were very few. Such care, if rather primitive medically, was a humane service of inestimable value. The doctor's availability gave the patient a feeling of confidence and security which is by no means always to be had today.

In urban areas the situation was similar, but on a somewhat more exalted level. The doctors, again almost entirely in private practice, were for the most part unspecialized, but it was during the mid-19th century that specialization began to appear. To get training in a clinical specialty one was practically obliged to study abroad, preferably in Vienna. Then one came home, hung up the certificate of his specialty training in his waiting room, and went to work on much the same basis as the general practitioners, except that much more of the work would be done in the office than in the home. It was from all these practitioners that the faculties of medicine in the clinical subjects were recruited.

Those physicians and surgeons in each field who had the most acclaim in their communities, who were most highly thought of by their fellows, and who had had the most distinguished educations were likely to be made professors and chiefs of service in hospitals. These doctors were usually unpaid. They were happy to serve for nothing on the staffs of the teaching hospitals because of the acclaim to be gained and because of the experience in both the care of patients and the teaching of students which was to be had there. These great clinicians became the idols of the medical students. To walk through a hospital ward in the wake of such a one was as stimulating an experience as they could have. Much of the diagnostic technology of today was still undreamed of. Far more dependence was placed on direct observation, history taking and physical examination than today. The teacher who could discover a great deal about the patient and his disease by the power of his own unaided senses was greatly revered.

One very important difference between those days and today lay in the matter of hospital care for private patients. The great voluntary hospitals and the municipal and county hospitals did not ordinarily admit to their wards the wealthy or well-to-do. If the doctor wanted to hospitalize a private patient and care for him himself, he had to send him to a private hospital of one sort or another, and these were few and far between before 1900. But he was not likely to seek hospitalization if he could possibly manage in the patient's home. With the much greater availability of good private-duty nurses in those days, this was usually possible. Surgeons did even major surgery in homes, usually on the kitchen table. I can recall vividly how in 1897 my younger brother was cared for quite successfully in our home through typhoid fever with two relapses. Everything that was available in a hospital was made available at home.

With the arrival of the automobile, the practicing medical profession very rapidly became motorized and it was possible for physicians to cover much wider areas than their horse-drawn predecessors. Surgeons often traveled through several counties in a morning, doing three or four major operations at widely scattered points and instructing the local family doctor on subsequent treatment. One of Boston's leading surgeons in my boyhood lived a few doors away from where my family did. Often I saw them taking off early on a winter's morning in a huge open touring car. Surgeon, chauffeur, assistants, nurse, and maybe a medical student or two, all in great coonskin coats, made a very impressive sight.

But even this sort of care was on the way out. Gone are the days when the doctor went to the patient. Now the patient usually must go to the doctor. In those days, too, there were consulting physicians who would answer calls by motor up to 100 miles or so. In some cases such work constituted the major part of a doctor's practice. The memory of this style of practice remains vivid in the minds of some people, who long for its return. Doctors who remember this era may also regret that today's civilization no longer permits them to practice in this manner.

Such briefly is the background and evolutionary heritage of the American doctor of today. We must now investigate what use he is making of his inheritance. Before doing that, however, let us take note of three momentous events which stirred American medicine around the turn of the present century.

The first of these was the opening of The Johns Hopkins Hospital in 1889, in which four men played vital roles. There was Mr. Johns Hopkins himself, who had the vision of a new kind of higher education for the United States and who gave the money to found a university to

implement it. Next was Dr. John Shaw Billings, who planned and built The Johns Hopkins Hospital and participated in the selection of its staff. The third, William Henry Welch, was selected by the university's President Daniel Coit Gilman—who in turn had been proposed for The Johns Hopkins presidency by President Charles William Eliot of Harvard University—to be the first professor of pathology. Welch had been thoroughly trained in Germany at the time when the basic scientific disciplines were blossoming in almost explosive fashion. France had had its Claude Bernard and Louis Pasteur, but it was in Germany that scientific medicine had its first most vigorous growth. Welch was thoroughly cognizant of this new knowledge and transplanted it to Baltimore for the benefit of American medicine.

The fourth, William Osler, who came to Baltimore from Canada via Philadelphia to be the first medical chief at Hopkins, revolutionized the clinical training of the medical student. He got him to the bedside and gave him a responsible role under guidance in the care of the patient, as Robert Graves had done in Dublin a half century earlier. This system of teaching, which Osler imported from Britain, represented a great advance in clinical instruction in the United States. Indeed, what Osler and Welch accomplished between them was the fusion of Germany's best in basic medical science with Britain's best in clinical teaching. The blend was better than the sum of the ingredients, and it constituted an uplifting force in American medical education which has been felt ever since.

The second of the great events which I mentioned was the founding in 1903 of the Rockefeller Institute for Medical Research. The chief significance of this event was that it pointed up the facts that without research there is no progress, and that effective research requires specially skilled people abundantly supported in all their basic needs, scientific and otherwise. It was a first step in the chain of events, continuing to the present time, which led to the stupendous expansion of medical research facilities and activities which we see all about us today, and which constitute a large segment of the total medical establishment.

Finally, the third event, the publication of the Flexner Report in 1910, rocked medical education in the United States to its roots. Abraham Flexner, an educator and a brother of the famous Dr. Simon Flexner, made for the Carnegie Foundation for the Advancement of Teaching a survey beginning in 1908 of nearly every medical school in the United States. His findings were shocking. Nearly everywhere he found grossly inadequate teaching facilities. Faculties "consisted of busy practitioners with no time for teaching and no thought of research." This reminds us of the purpose avowed by the AMA in 1848, "to initiate reforms to correct the deplorable condition of medical education which then prevailed." It still prevailed apparently at the beginning of the 20th century. Nor had the claim of the first AMA president that "the medical profession always cleans its own house" been substantiated. After the publication of the Flexner Report many medical schools were closed and many others were reformed and upgraded to meet certain set standards. The only school which Flexner found completely satisfactory was at The Johns Hopkins University.

Full-time university medicine came into being because of the drawing realization that the teaching of medicine required as much pedagogic skill as the teaching of anything else at the university level. It could not be left to amateurs. The fact that a doctor was a superb clinician did not imply that he was *ipso facto* a competent teacher nor that he had the requisite ability to organize and administer the various activities of a teaching clinic in a way to make them effective. For some years before the clinicians, the basic science members of the medical faculties had been on a full-time salaried basis. Osler, perhaps earlier and more clearly than anyone else, perceived the necessity that there be on faculties of medicine a certain number of salaried teaching clinicians. As early as 1911 he wrote: "The professor [that is to say of a clinical subject] has three duties—to see that patients are well treated, to investigate disease, and to teach students and nurses. He should be a man of wide sympathies and of trinocular vision. He should have a comprehensive and thoroughly scientific training, and should enter clinical medicine through one of three portals—physiology, chemistry, or bacteriology and pathology. He must be keenly practical, keenly scientific, fond of his patients, fond of his work, and devoted to his students. He should live as much in his wards and laboratories as do his [preclinical] colleagues in their laboratories of anatomy, physiology, or physics." How one finds such

paragons has become the number-one question for faculties of medicine today.*

With Osler this kind of medicine began germinating, and after the Flexner Report, its growth and spread through the United States were greatly accelerated. An educational revolution it truly was, and its effects have been felt by nearly all of our present day medical doctors. Although relatively few of them have gone into full-time university medicine themselves, at least most of them will at some point in their education have come under the influence of full-time clinical teachers who will have left some mark on them. They will be better educated than they otherwise would have been, and they will have a broader understanding of the nature of medicine, in consequence, than did their predecessors.

SINCE the last war, there has been, also, a growing public interest in health matters engendered by innumerable articles on health in newspapers and periodicals, and in advertising of the drug industry. All this printed matter has created in the people a greater concern about their health than had ever entered their minds before. In consequence they have developed notions about how they should be treated, and sometimes they have even told their doctors what to do for them.

Very often in the early antibiotic days, a patient entered a doctor's office and said, "I have a cold, doc, and I want a shot of penicillin." If the doctor refused to give it, the patient went off and found another doctor who would. This sort of thing is detrimental to the doctor-patient relationship, which to be good requires confidence on the part of the patient in the doctor. With irritation on both sides, the gap between doctor and patient is widened. There are other factors which tend to widen this gap. For one thing, so much of the diagnostic process is now done through technological procedures that the doctor has lost some of his apparent omniscience, prestige and mystique. For another, along with the development of the affluent society and the increasing demand for medical services, the incomes of doctors and people in allied professions and occupations have risen to incredibly high levels, which did not drop off much even in the depression years, thus causing some resentment among people who were having financial difficulties, often very severe.

The most conspicuous change in the behavior of the doctor is that nowadays he is usually in such a hurry that he is less accessible and less communicative. This also widens the gap. He is usually in a hurry because he is overworked: Too many people need medical care, people demand more medical care; and there are not enough doctors to supply it. The doctor is busier than he wants to be or than is good for him. I also suspect that at times his devotion to his patients is lessened and the quality of medical care which he provides is impaired. Moreover, owing to the advance of medical science and technology, the care he is expected to supply becomes ever more complicated. A greatly increased burden of work is thrown upon him. No wonder he is in a hurry. He is desperately trying to catch up, and despite the longest working hours of any of the professions, he can never quite do it. This is veritably a doctor's dilemma. Will the doctor inevitably have to confine himself to strictly medical matters, or can he continue to be the family friend and counselor?

An outstanding example of a corner cut is the disappearance of the home visit, especially the night call, which has been supplanted by the telephone. Something essential can be lost when the home visit is not made. Seeing the patient in a relaxed and leisurely manner in his customary setting and in contact with his family can be very important to the doctor in developing a complete understanding of the case. In the old days the doctor was the intimate friend of the family, almost a member of it. He was the family counselor for all sorts of things other than medical.

ACTUALLY, under present-day working conditions in medical practice, home visits have become so difficult for the doctor that he cannot be blamed very much for not wanting to make them. If he has a waiting room full of patients eager to be seen and very likely there by appointment, or if he is conducting a ward round or holding a clinic in a hospital, how can he rush off to pay a home visit? Traffic jams and parking difficulties are also inimical to house visiting. Another change in today's way of life which impairs the quality and continuity of medical care is the greatly increased moving about of individuals and families. Continuity of care becomes difficult—sometimes impossible.

One of the greatest responsibilities of the prac-

* See W. Osler, "The Hospital Unit in University Work," Lancet 1191, i, 211.

titioner of medicine is to be available to his patients. As time goes on, this he is less and less likely to be. He will accept, for example, the care of a patient with a prolonged illness for whom curative medicine has nothing to offer, but who for psychological reasons needs frequently to be visited. The doctor may get more and more irked by having to make such visits; he regards them as a waste of his precious time, which he would rather spend on patients he thinks he can help specifically. The element of compassion ceases to count very much. Of course, there is a solution for a problem of this nature. The doctor can, and should, withdraw from the case and turn it over to another doctor who is competent and willing to accept full responsibility in his place. The official code of medical ethics prescribes just such a procedure.

Our doctor's professional forebears of the 19th century, and earlier, practiced medicine in a serenely individualistic and leisurely manner, not permitted by our present society. Now the doctor is inevitably part of a great social structure which we may call "American medicine," or the "health forces of the nation." In these forces the doctor of medicine, together with his counterparts in public health, may be said to constitute the top echelon. He is also surrounded by, and dependent upon, a host of other professional people known as paramedical—nurses, social workers, therapists of many kinds, administrators and technicians of endless variety. Without access to this great array of skills, our doctor could not make available to serve sick people the vast stockpile of medical knowledge which exists. Nor can the doctor who does have access to them utilize them for the people's benefit without organization for medical care.

There are other evidences of a declining sense of responsibility among doctors. For example, we have recently seen doctors walking out on strike, quite like labor union members, in Saskatchewan, and threatening to do so in New Jersey. This would have been unthinkable a few decades ago. The increasing willingness to practice medicine by telephone and the custom of giving patients appointments weeks in advance, during which time their illness may become seriously aggravated, seems to me to fall short of the ideal doctor-patient relationship. The growing gap between patient and doctor should give the profession some uneasiness.

Another feature which characterizes the medical practice of today is the great increase in specialists. Nearly everyone in medicine nowadays seems to wish to be a specialist. Even the most bona fide generalist* will find some little area in which he seeks to acquire some touch of authority or expertise. Specialization is favored by doctors because it is easier to know a great deal about a little than the reverse. The specialist, moreover, makes a better income and enjoys a somewhat higher status in the public mind. It is interesting and perhaps significant that figures show that the abler medical graduates prefer to go into specialties. It is generally the scholastically lower-standing men who go into general practice.

In medicine the diseases of most of the organs or systems of the body are regarded as fit subjects for specialization: neurology, hematology, gastroenterology, dermatology, ophthalmology, as well as many others. Sometimes a specialty is built up around a technology, such as radiology and endoscopy—of course, surgery actually is in this group. These are clinical specialties, the older of which are now being further split up into splinter specialties. To practice any of them exclusively and with expert skill, the doctor must first have become a well trained general physician or surgeon, and upon these qualifications superimpose his training as a specialist. In order that the public can be assured that a doctor is a properly qualified specialist, a flock of so-called specialty boards has been established to define training requirements and conduct examinations which, if passed, permit the doctor to be declared a certified specialist in his particular field. These boards are voluntary, not official; nevertheless, they have with the passage of time acquired sufficient prestige so that their accreditation is as good as official. A specialty may be said to have reached full maturity when it gets its board. This process can easily be carried *ad absurdum*.

It is not usually best that patients go directly to specialists since they may choose the wrong ones.

* By generalist, I mean that which is left of the general practitioner of an earlier day, the opposite of the specialist. He is a nonspecialized physician with a broad spectrum of competence. He is the one to whom the patient ideally goes first and who very likely becomes the patient's regular personal physician. His first duty is to make a diagnosis and then secure for the patient whatever treatment this diagnosis calls for. Usually nowadays he is an "internist." This classification is essentially confusing and useful only to indicate the kind of training the doctor has had.

Their generalist should refer them to appropriate specialists. Sometimes patients engage in what we call medical shopping; that is to say, they make their own list of specialists on the basis of information picked up by hearsay.

Consultative activities have also changed a great deal within my memory. In the Victorian spirit, the consultation used to be a formal affair. If the attending physician reached an impasse, he asked to be allowed a consultation; or if the family were concerned about his capacity to deal with the case, they could ask for one. Under these circumstances the ethical code required that the attending physician call in a consultant. Consultations, then, were personal meetings; a date was set and the doctors—sometimes several of them had been called—gathered at the bedside. After observing the patient as much as they liked, they adjourned until they had arrived at a consensus of opinion. Now the attending physician refers the patient to such specialists as he deems necessary, and the patient must go to all their offices to see them. In due course he goes back to his personal physician, who will have heard from the several consultants and digested their separate opinions to form a final one of his own, on the basis of which he instructs the patient, or should instruct the patient.

It has seemed to me that in recent years, doctors have become increasingly reluctant to call for consultations, especially in smaller towns and rural areas. One reason given is that they wish to save their patients expense, but a more likely reason is that they fear some loss of face if they ask frequently for consultations. They fear the implication may be drawn that they lack professional self-confidence or skill; they may be fearful of losing a patient to a consultant or of having the embarrassment of being proven wrong.

In similar fashion many doctors seem to be reluctant to call in paramedical people, such as social workers, visiting nurses or occupational therapists, when they could render important benefits to patients. Doctors even seem to be ignorant of what resources of this kind are available in their communities, or how to call them into action.

The ethical standards of the doctor today form an essential part of our characterization of him. Have they been maintained at the highest level ever achieved by the profession, or have they deteriorated? The code of ethics to which the profession has at least given lip service through some 23 centuries is embodied in the Oath of Hippocrates. It is completely valid and appropriate today, but there are certain very urgent ethical problems which bedevil the modern doctor about which the Oath gives but limited help. The most important of these are birth control and euthanasia. It is for society, not for the medical profession, to solve both of these problems. Both birth control and euthanasia involve the taking of human life and are therefore repugnant, but the former need not do so. It may rest upon measures designed merely to prevent conception, not to abort life already started. I believe that the problem it poses will be solved by society as soon as population density gets so high that the people living at the time can no longer tolerate it.

Euthanasia by definition involves the taking of life, but nowadays it often takes the form of merely permitting nature to end life for us. The questions may well be asked: How long are we justified in prolonging life by artificial means in the person who has no prospect of recovery? Are we justified in curing pneumonia with penicillin in the old or chronically ill person who has nothing but a life of misery to look forward to? How long are we obligated to maintain life by mechanical artificial respiration when there is evidently no chance whatever of the patient's being able to live without it? May we turn it off and let nature take its course? The humane answer would seem to be yes, but we have, inadvertently, trained our young doctors to consider it a virtue to prolong life for the sole purpose of prolonging it.

Thou shalt not kill but needst not strive
Officiously to keep alive.*

It is necessary that we consider how doctors behave when organized as well as how they act as individuals. The founding of the AMA in 1848, which to all intents and purposes was the beginning of so-called organized medicine in the United States, has already been mentioned. In seeking to identify the role played by organized medicine in the progress of medicine in the United States, it will best serve our purpose to consider the whole establishment of national, state and county medical societies as constituting, from the sociological and political points of view, a single great apparatus. This is organized medicine or the doctors'

* Arthur Hugh Clough, "The Latest Decalogue."

guild. Its ideology is very like that of the big labor unions. It is out to improve medical education and medical care, but in its own way; and it has done much to accomplish these ends. But what it does is always done in such a way that the best interests of the doctors are never contravented. Thus in 115 years the AMA has stood steadfastly against any extension of government participation in medical affairs. "Keep the government out of medicine," is its primary slogan. To that end it has spent huge sums of money on lobbying and propagandizing the public and on other pressurizing tactics, and it has now set up a continuing political action committee quite like those of the fighting labor unions. Every attempt that has been made by liberally minded groups to improve medical care and make it more accessible—and there have been a succession of such attempts since 1932—the AMA has attacked with ever increasing truculence.

When organized groups become truculent, it is usually because they feel threatened or insecure in some way. Just how do the organized doctors feel threatened? Presumably they are fearful that any further extension of government into medicine (we already have considerable) would sabotage certain prerequisites of practice which they cherish or would diminish their power in the community. They wish to be the sole arbiters of their own professional affairs. They wish to maintain a monopoly in medical practice. They forget perhaps that medicine is for the people, not for the doctors. They need some enlightenment on this point.

Not only is the doctor of today under constant pressure from his guild to conform to its tenets and ideology, but also various other socio-economic forces peculiar to our times bear down upon him and condition his behavior to some degree.

One very characteristic problem of the doctor today is the constant and growing pressure that he is under from the drug industry. Of course, our whole society during most of its waking hours is under constant bombardment by Madison Avenue through all the mass media, but the technique used with the general public is a bit different. In the case of the doctor, it includes a daily deluge of advertising material by mail, invitations to try out new drugs on unsuspecting patients, and free samples left by detail men on the doctor's desk. The effort is to make the doctor "beholden" to a drug company and thus oblige him to prescribe its products. And consider the increasing amount of iatrogenic disease—disease produced by the doctor. Many of the new drugs can produce very serious untoward side effects, which are worse from the patient's point of view than the malady for the treatment of which they were prescribed. One of my teachers once said, very wisely, "Gentlemen, in the practice of medicine, for God's sake at least do as little harm as possible."

And now one may ask what is to be done to make the situation better. If the primary trouble is the shortage of medical manpower, more effective recruitment would seem to be one way. Medicine must be made to appear more attractive to our young people seeking professional careers, for it requires the longest and most difficult of all professional education programs in the United States today. It is especially arduous for married couples, among whom it sometimes creates very difficult emotional problems. The wives of medical students and house staff members are left alone a great deal, so long are their husbands' hours of work. Medical education is also the most costly. The situation is much worse in these respects than it was a decade or so ago. And to cap it all, there is the threat of military service always in the background.

A good suggestion for increasing recruitment of medical personnel is to entice more women into medicine. Some countries, notably Russia, have a very much higher percentage of women in medicine than we do. From my own experience in this matter, which goes back at least to the middle twenties, when we began taking women interns and residents on the medical services of the Massachusetts General Hospital, I have formed the opinion that women are as capable of becoming fine physicians as are men, and that we should welcome as many well qualified ones as we can get. If these recruitment difficulties could be overcome, and a great increase in medical enrollment should result, then we would be short of teachers and of teaching facilities. To many educators and others it seems that these difficulties can only be overcome by government aid, but organized medicine always has and may be counted on to continue to oppose such aid.

Another important way in which medical care can be made more available is through increased

efficiency in the use of the doctor's time by organization for medical care. Since one doctor can himself no longer provide all a patient may need, doctors will have to work in well integrated groups in which the various members play individual roles, the sum of which will add up to a good medical care program—group practice. Group medicine is, actually, the multiple representative of the single practitioner of earlier days. There is nothing particularly new in the concept of group medicine or group practice. Every hospital with a closed visiting staff and an organized house staff is, in effect, practicing group medicine. There is nothing particularly new in the concept interest in group medicine, and a steadily increasing proportion of doctors in the country are practicing as members of organized groups. There is now even a national society working vigorously to promote group health plans (G.H.A.A., or Group Health Association of America). The existing groups run all the way from small ones with less than 20 doctors to great chains of such facilities as in the Health Insurance Plan of Greater New York or Permanente in California. The Mayo Clinic is certainly a group medical unit of a sort.

In group practice at its best, the doctors are paid by salary, and patients pay for services on prepayment plans of some sort. As such medical groups proliferate and especially as they become arranged in chains and networks, they well may be expected to cover the country and afford what amounts to a national health program on a private enterprise basis. Under the challenge of group practice, the presently prevailing system of solo practice for a fee for service may be expected in time to disappear, to be replaced by the prepayment group system. Under these circumstances a given number of doctors should be able to bring better medicine to more people than under the present system. Then indeed we could have prepaid comprehensive medical care for all, which this writer would regard as the ideal.

Such then in very broad outline is a representation of the practitioner of medicine in the United States today. Whether he likes it or not he is inevitably a functional unit in a vast network of services which collectively have the overall function of preserving, promoting and restoring the health of the American people. He is a very far cry from his horse and buggy professional ancestor, but it is very surprising that he is not as aware of this fact as he ought to be. He clings to that rugged individualism of the colonial doctors. As indicated earlier, he is very well organized for political action, both at the national and at local levels; he has his own professional politics conducted within the framework of the medical societies, often by professional medical politicians. But within the realm of providing medical care, which after all is his *raison d'etre,* the doctor is hardly organized at all. For the most part he is hostile to organization at this level; he calls it socialized medicine if and when government has any part in it, and he may even occasionally brand private efforts to achieve the purpose "socialized medicine." The public should be aware of this animus.*

In conclusion, we can say that the doctor of today is hard pressed from many points of view. He is to a considerable degree a harassed person. He is engulfed by a deluge of new scientific knowledge, which his conscience tells him he is obligated to grasp and apply to his patients' betterment, but which his education has not prepared him always to understand easily. He finds in a sorry state of chaos the organizational machinery which is necessary to make the medical care he can provide easily available to any or all people, and finds very little good will or intent to set it aright. If he tries to find a better way by experiment, he is chastised by his powerful union. He is under constant pressure to conform. While the total professional work load is increasing, he sees a steadily increasing number of his fellow professionals being siphoned off into research or other full-time medical occupations and thus rendered unavailable to help him meet the total medical care problem. He has every right to feel frustrated, but the amazing thing is that he rarely, if ever, shows any outward or visible evidence of it.

Thus the functions and character of *Homo medicus americanus* are extraordinarily diverse and far flung. Yet the basic principles of Hippocrates still apply to them all, and bind them together into one great profession.

---

* For a good description of group practice and what it has to offer the patient, see E. P. Dearing, "The Challenge of Comprehensive Health Care," *American Journal of Public Health* (1962), p. 2071.

Medical Discipline

The Medical Disciplinary Committee, through its various activities, sought to find out if satisfactory disciplinary mechanisms exist and if they are being effectively used. The results of the study show that, by and large, adequate medical disciplinary mechanisms do exist and that they are used. The frequency and effectiveness of their use, however, are less impressive. There has been a failure, in some areas, to act promptly, impartially, and objectively when the necessity arises.

Based on the belief that there is room for improvement in the discharge of medicine's disciplinary obligations and the realization that disciplinary mechanisms must be constantly reviewed and improved, the committee recommends the following:

Medical Associations

Your committee believes that state medical associations have not been as effective as they could be in the area of medical discipline because of the practice of limiting their concern to matters that are appealed to them from the local level. Some defects in basic mechanisms and considerable apathy at the county and state level in taking action against offenders have contributed to the situation which exists.

It is the recommendation of your committee, therefore, that:

1. State medical associations become actively concerned with the disciplinary programs of county medical societies and develop a greater interest in and knowledge of the activities of their component societies in the discharge of disciplinary obligations;
2. State medical associations review their disciplinary programs critically and at once to the end that changes in disciplinary mechanisms at state or local level may be made as necessary;
3. State medical associations develop indoctrination programs for use by their component societies to acquaint new members with ethical principles and acceptable socio-economic practices;
4. State medical associations continue to encourage the widest development and use of grievance committees and urge that their component societies make the services of such grievance committees more widely available;
5. State medical associations increase their concern and activities with respect to complaints of overcharging, medical advertising and solicitation of patients, abuse of prepayment and insurance mechanisms, as well as all other conduct inimical to the best interest of the public and the profession;
6. State and county medical societies utilize grievance committees as "grand juries" to initiate action against an offender so as to obviate the necessity of making an individual member of a medical society complain against a fellow member;
7. State medical associations amend their bylaws to provide that the state association

Conclusions and recommendations in the report of the Medical Disciplinary Committee to the Board of Trustees, American Medical Association, June, 1961.

may take necessary disciplinary action when it believes that serious violations of ethical principles have occurred without necessary corrective action being taken first at local level or when the state association believes that serious charges brought against an individual are not being given proper or prompt consideration by the disciplinary committee of the county medical society concerned;

8. Each state medical association and all doctors within the state give increased support to the state board of medical examiners as it seeks to obtain proper appropriations for the conduct of its affairs and that the state medical association and its membership be concerned with the selection of qualified and dedicated members for its state board of medical examiners;
9. Each state medical association develop and administer review and utilization committees; and
10. County medical societies review their by-law provisions relating to disciplinary procedures and revise them as necessary.

American Medical Association

Your committee believes that the American Medical Association should become more aggressive and active in supplying advice and assistance to state boards of medical examiners and state and county medical societies in all aspects of medical discipline. It is recommended, therefore, that:

1. The Executive Vice President be requested to provide this assistance, on request, through the proper department of the Association;
2. The American Medical Association, in cooperation with the Federation of State Medical Boards, the Council of State Governments, and other interested groups draft a model medical practice act;
3. The American Medical Association encourage and urge each state medical association to report annually to the American Medical Association all major disciplinary actions taken within its jurisdiction during the preceding calendar year;
4. The American Medical Association encourage and urge the Federation of State Medical Boards to cooperate with it in developing a means whereby each state board will report promptly all major disciplinary actions taken by it to the American Medical Association;
5. The American Medical Association distribute annually to all senior medical students in the United States copies of the Principles of Medical Ethics and Opinions and Reports of the Judicial Council;
6. The American Medical Association prepare a syllabus or lecture guide on the subjects of medical ethics, medical practice acts, and proper socio-economic conduct for the use of physicians called upon to give lectures on these subjects in medical schools, hospitals, or before medical societies;
7. The bylaws of the American Medical Association be changed to confer original jurisdiction on the Association to suspend or revoke the AMA membership of a physician guilty of a violation of the Principles of Medical Ethics or the ethical policy of the American Medical Association regardless of whether action has been taken against him at local level;
8. The American Medical Association request that adequate lectures on ethics and proper socio-economic practices be given in all hospitals approved for internship or residency training; and
9. The American Medical Association instruct its representatives to the Joint Commission on Accreditation of Hospitals to urge the Joint Commission to adopt, as a requirement for accreditation, the giving of adequate lectures on ethics and proper socio-economic practices each year within the hospital.

Finally, your committee recommends that American medicine at the national, state, and local level maintain an active, aggressive, and continuing interest in medical disciplinary matters so that, by a demonstration of good faith, medicine will be permitted to continue to discipline its own members when necessary.

The Physician as a Defendant in Discipline

THE HONORABLE CHARLES L. TERRY, JR.
Judge, Superior Court of the State of Delaware

One of the most delicate subjects with which a doctor can be confronted is the imposition of discipline upon his fellow practitioner.

It would be a clear impertinence on the basis of a law profession to presume to define those limits beyond which a doctor could not go without incurring disciplinary sanctions, or to propose just what those sanctions should be in each instance of an infraction. Such a task, if it can be done at all, could best be done by you, and you have always had a just call to the responsibility it imposes.

The ill-informed and misguided are always in our midst and the lunatic fringe seemingly has a never ending supply of novel and dangerous schemes by which they seek to cure all of the real and imaginary ills of society. The advocation of socialized medicine might well be viewed by you in just such a light.

When the hue and cry goes out for such an extreme program you can rest assured that you, as the potential victims, have failed somewhere along the line. To be dangerous, such a proposal needs considerable popular support, and if such support can be marshaled, then there must be something not altogether right in the status quo.

Presented at Annual Meeting of Federation of State Medical Boards, Chicago, February 6, 1962.

The law profession has often felt the bite of this type of discontent, and when the legislative axe had fallen we were forced to admit that we had become too complacent, too jealous of our presumed prerogatives, and even too contemptuous of outside criticism. The area of procedural reform is the area where we became most vulnerable. Cumbersome and stilted court procedures surviving from hoary antiquity were blindly preserved to the disgrace of the profession and the frustration of justice.

When the profession failed to move, the legislatures did, and the result was often an unwholesome hodgepodge. In Delaware, the legal profession recognized the danger before it was too late, and effected its own reform. The result was most salutary. A little more delay and it might have been tragic. This analogy may not be perfect but it should illustrate the point.

One often hears petty digs and sly innuendoes leveled at various members of the medical profession and at the profession in general. Ill-founded? Perhaps. But does it matter? It should not be ignored, rather it should be feared, and it should prompt introspection, analysis and action, otherwise the public concept is distorted. The criticism continues and grows. The stature of the profession is being eroded—piecemeal.

If the thesis has any validity, if there is an undercurrent of criticism and discontent, and if it can be traced to various acts of individual practitioners, then the most obvious corrective device is the disciplinary process.

First of all, as a judge, I believe I know something of the problems that confront men when they sit in judgment of their fellow men; when they try to dispense that illusive essence called justice. To that end I have spent the better part of my adult life. But I also know something about the peculiarities of enforcing the strictures of medical discipline. This last bit of insight I have gathered from sitting on the Medical Council of Delaware. By law, my position as President Judge of the Superior Court requires me to serve in the company of two physicians as a member of that three-man board. Among other things, we are charged with the enforcement of medical discipline, and more than any other body in our State we are faced with these problems in their varying complexities.

It should always be foremost in our thoughts, that when we enforce discipline upon an errant physician we sit in a judicial capacity and we punish the doctor in much the same fashion as criminal courts punish a malefactor. To suspend a license for a specified time or to revoke it altogether is close to being the most harsh punishment you could wish to inflict on a doctor. Even the lesser disciplines such as probation or reprimand might seriously affect a man's reputation and practice. Because the charges and consequences are often so severe, we must exert every effort to be scrupulously fair in our procedure.

As a Judge, this procedural question is one of the paramount considerations in disciplinary cases. The whole action is quasi-criminal in its scope and effect. A man stands charged with unprofessional, unethical or dishonorable conduct. He may lose his entire livelihood if he is convicted. Therefore, he must be guaranteed every possible device to defend himself in these most crucial proceedings. The procedural rules being the rules by which he is tried, if they be anything less than fair his trial can only be a mockery and justice will be subverted.

In Delaware we have a very up-to-date Medical Practice Act, and we have incorporated in that Act various rules of procedure which are well calculated to provide all the desired safeguards. If you should wish more information, refer to the Act itself, particularly Title 24 of the Delaware Code, Section 1741.

The main thing to be considered in such procedural schemes is that they must have full and ample provisions for the receipt of all the evidence, fair and impartial evaluation thereof, adequate review, and the right of appeal.

In Delaware there are provisions for a three-man censor committee in each County, composed of physicians recommended by the County Medical Society, and appointed by the State Medical Council. Anyone may present charges to the committee, or the committee may act on its own motion. Once the possibility of misconduct is presented to the committee the procedures for notice, hearing and determination are activated. The alleged offender is notified of the charges and the date and place of hearing. He has the right to be represented by counsel and the charges are presented to the committee by the Attorney General who represents the prosecution throughout all the proceedings up to final conclusion.

Both sides have full privileges to subpoena witnesses and documents and to take depositions. Thus we are assured of a complete production of evidence and a craftsmanlike presentation. A stenographic transcript is prepared. After all the evidence is in, the committee of physicians makes its evaluation and in a draft report sets forth findings of fact and conclusions. The respondent is given a copy of the report and he has an adequate time in which to file all of his objections. The committee considers his objections and then files a final report with the Medical Council with a recommendation as to whether or not discipline is justified. The doctor also gets a copy of this report. And once again he is entitled to file exceptions, this time to the Medical Council. The Council then receives briefs and hears arguments. Only after all of these opportunities have been offered does the Council sit to determine what action should be taken. It may revoke or suspend a license, place the offender on probation, censor him in some other fashion or acquit him as it sees fit. Two doctors and a judge make this decision. If the offender is still not satisfied he may appeal the matter to the Superior Court where he can have a full review of all the foregoing proceedings on the

record as prepared. Once more there are briefs and arguments. The Superior Court has the power to remand the case for further hearings before the Medical Council or it may reverse, affirm or modify the decision from below.

All of the major safeguards are included in this procedure. Full notice, right to counsel, right to production of all evidence, right to subpoena, right to examination of all witnesses, right to be judged by competent judges from among ones "peers," right to appeal, right to review. No more could be asked.

Our law, however, does not provide for closed hearings. This might be a weakness, for if a man is acquitted he may still suffer from the publicity of trial. Perhaps all of the proceedings should be confidential until such time as a final judgment was entered and all available redress exhausted. Then if the decision were adverse it should be widely published, not only in the offender's home state, but throughout the land. I suggest that a national clearing house be established, by some group like the AMA, to collect the results of disciplinary actions everywhere, making its files available to all who might wish to determine that a particular doctor does not have a record of ethical or professional infractions.

So much for procedure. But let me observe that all of the procedure that we can adopt means not one thing if the law is not fair or is not enforced.

Many times a doctor does something to cause adverse comment, but no one calls him to task. Why? This reluctance often stems from an uncertainty of just what the standards are, an uncertainty as to whether or not the doctor has really done something wrong. This uncertainty coupled with a natural aversion to "blow the whistle" conspires to let many abuses which really deserve attention, go by the board. This is fertile ground for the public malcontent which has been discussed. Without well-defined standards, enforcement is retarded. But what is equally important, enforcement without adequate standards is productive of injustice.

In the criminal law punishment is imposed for the violation of the law. But there must be a law or standard upon which we can determine a breach. The law must be reasonably specific; it must be published. If it is vague and indefinite as not to give reasonable notice of what it proscribes, it would be unjust and unconstitutional to enforce it. The standard of precision required often varies with the nature of the offense, and where this is true of the criminal law it would seem to be equally true in the field of professional ethics. Because of this, there is a real need to formulate a relatively comprehensive and specific code of professional ethics for the practice of medicine.

The Delaware Medical Practice Act gives the medical council a broad base upon which to mete out discipline. There are 12 enumerated areas in which we are empowered to act. In 11 of the 12 the grounds are adequate. Hence, there is little difficulty in understanding what was meant by such offenses as "conviction of a felony, including an unlawful abortion," or "drug addiction or chronic and persistent addiction to intoxicants to such a degree as to render the licensee unsafe or unfit to practice medicine," or "the practice of medicine under a false or assumed name." These are fairly clear-cut offenses. But what precisely do we mean by saying it shall be improper to engage in "any dishonorable, unethical or unprofessional conduct likely to deceive, defraud or harm the public?"

With most of the more flagrant violations of good ethics or good practice we would have little trouble. For example, the indiscriminate writing of prescriptions for narcotics so as to enable an addict to keep up his source of supply, is such an offense as would prompt anyone to consider revocation. This and other such clearcut areas of misconduct are recognized by all physicians. They are the black zones. But what of the gray zones? When does a doctor disgrace his profession by too much social drinking? How much, if any, restrictions are desirable in such an area? Certainly we would be foolish to try and specify the number of drinks a doctor could take in a public cocktail lounge, but if his carousing becomes a source of gossip, does not the entire profession suffer to some degree? And if so, should he be admonished by some agency with authority to do so?

The field of professional ethics and practice is continually shifting with the mores of our time and the advance of medical science. Such national organizations as the American Medical Association and the Federation of State Medical Boards should continually re-examine and revise a code of ethics such as would provide physicians throughout the country with readily understood and generally accepted standards by which they should conduct themselves. Such standards should

be continually re-examined and, to be effective, should be generally circulated.

The key here, however, is the word "general." No nationally accepted standards can solve all specific questions, nor should they be expected to. In most instances such codes would merely give expression to conduct generally recognized as the norm.

Once such general standards have been formulated and published, then the particularities can be determined in a variety of ways. One obvious way would be to charge an errant practitioner with a particular violation under a general and broadly worded canon, and then try him before the appropriate tribunal to ascertain whether or not the alleged offense is truly within the ambit of the general standards as interpreted by the tribunal.

Another way would be to have the local medical societies add their own embroidery to the general standards. Furthermore, various societies of specialists might also find the need for spelling out certain particular standards for their brother specialists, which might not otherwise apply to those not of their specialty.

Within this area of ethical draftsmanship it must always be borne in mind that nationally accepted standards will probably be rather general in their pronouncements, while local standards may justly be somewhat more specific. This would be so because the standard of professional conduct in the profession in a large municipal medical center might vary quite a bit from the standards in a small rural community.

The desirability of such a definition of standards would seem self-evident. Not only would it serve to provide a proper notification to an offender so as to insure due process, but it would benefit the entire profession in several other distinct ways.

To preserve for the profession that high standard of perfection that it deserves and needs, will require that all physicians be held to the highest possible standards. Enough venial sins can damage you every bit as much as the mortal sins with which we are usually concerned.

It is not valid to assume that all medical practitioners are properly aware of the full scope of professional ethics. Many of our American medical schools do not even teach courses in the subject, it being presumed that the young doctor will absorb the standards more or less by osmosis as he goes through his training.

What is more, we are becoming more and more reliant upon foreign-born and foreign-trained physicians of whom we often know very little. These doctors meet a crying need and help to fill the gap made by our failure to train enough physicians at home. But they also point up a need for well-defined and well-published canons of ethics and practice. To these men, if to no one else, we owe a duty to spell out our standards.

It should also be noted that in this day and age the doctor's potential for financial reward has gone to great heights. The field of medicine can be expected to attract a certain number of men who have more interest in the financial benefits to be derived than in the ancient concept of dedicated service to humanity. Such men may always have been with us but perhaps their number is subject to increase.

A dedicated effort to formulate, restate, keep current, and enforce such ethical and professional standards would have the salutary effect of making the professional rank and file more and more alert to the erosions which might otherwise creep up and undermine the practice of medicine as we now know it. You may find problems which you never dreamed existed. If you are alert you can protect yourselves. If you are not, you may one day find a scandal has come to life which will prompt a state or federal legislature to seize the initiative from the defaulting hands of those who should have done their own policing. This should be avoided at all costs.

No doctor should be abused and damaged by unfounded rumors or malicious bias, therefore the recommendations for full legal safeguards and secrecy of proceedings; but also offenders should not go unpunished and thus cast shame on the profession and cause injury to the public—therefore my suggestion for a definition of principles.

It takes courage to bring charges against a fellow practitioner. He may be a personal friend. But if he is forewarned and knows that he is expected to live up to the fine standards and yet fails to do so, it would be foolhardy to let him run his course. Your profession can be great only if you keep it so through jealous and diligent protection of its standards.

Relation of Grievance Committees and State Boards of Medical Examiners

GEORGE A. WOODHOUSE, MD
Chairman, Judicial Council American Medical Association

There must be good relations between *all* medical society committees concerned with the good conduct of their members and the state boards.

Too often both the public and the medical profession forget the purpose of a grievance committee. When the true purpose of a grievance committee is forgotten, the reasons for its cooperation with other groups are forgotten.

The Guides for Medical Society Grievance Committees, published by the American Medical Association, state that the purpose of grievance committees is to prevent or to resolve misunderstandings and to clarify and adjust differences between the physician and patient. The Guides continue to suggest that when grievance committees are properly organized and operated they can accomplish these objectives with increasingly improved public relations.

Grievance committees receive all kinds of complaints and investigate most of them. If possible, they mediate or arbitrate the complaint. If not, they refer the matter to an appropriate body for further action.

Presented February 6, 1962, Annual Meeting of the Federation of State Medical Boards, Chicago, Illinois.

It is clearly stated in the Guides that discipline is not a proper function of a grievance committee under any circumstance. Medical society discipline is the function of the appropriate judicial body of the society.

The purpose of an ethics committee or a board of censors is to hear and resolve complaints of unprofessional or unethical conduct by its members. The purpose of this type of committee is to police the society's membership. A board of censors handles matters of discipline within the society whereas a grievance committee handles complaints between a member of the lay public and a member of the society.

We have every reason to believe that grievance committees and boards of censors, by and large, accomplish their purpose. In the vast majority of instances their duties are discharged with care. Occasionally, however, a grievance committee or a board of censors is presented with a more serious or a novel complaint. Does it act as promptly and effectively in this instance as it does in the more or less routine case?

There are unexplored areas which need our attention if we are to develop good working

relations between medical society committees and boards of medical examiners.

A key question is jurisdiction. This is important to all three groups. A complaint about the size of a fee is properly within the jurisdiction of the grievance committee. Is it within the jurisdiction of that committee to consider the complaint of a patient that her doctor was intoxicated?

No one would question the jurisdiction of a board of censors to take action on a complaint that a society member violated the Principles of Medical Ethics because he solicited patients. Should a medical society take action against a member who has been fined on his plea of guilty to a charge of federal income tax evasion?

Besides these questions, there are others we must answer. Should a local, that is a county medical society, deal directly with the state board of medical examiners? Should the state board deal directly with the county society's committees? What formal liaison should there be between state and county medical society committees and state boards of medical examiners?

State medical societies undoubtedly should give serious consideration to this three-way relationship. The information which is available at the local level, plus the manpower which is available for investigation, should be utilized to the fullest extent. But this information and this manpower should be utilized efficiently.

Perhaps it would be well to develop a direct and continuing relation at state level between medical society and board of medical examiners. Exploratory meetings should be held and one of the first items of discussion should be the relation between county medical society committees and the state medical society and the board of medical examiners. Members of the state grievance committee, if there is one, and members of its council or its judicial council should be present. The purpose of this liaison should be to develop a working relation at state level.

Experiences should be exchanged, files opened and suggestions freely made. The relation should be such that neither society nor board err or suffer inconvenience in the same manner that the other had. Mistakes should not be repeated because of lack of communication or a lack of warning.

Perhaps now is the time to start thinking about the development and maintenance of central files at state level. There may be legislative, legal or just practical problems connected with the establishment of such files. Now is the time to find out what these problems are. If they are serious, now is the time to correct them. If relations between grievance and ethics committees and the board of medical examiners are to be helpful, some sort of assembled information would seem desirable if not essential.

Of course, it goes without saying that both the state board and the medical society committees should maintain a relationship which would enable one to refer matters to the other to handle. Relations should develop to the point where each would help the other gather facts to prove or disprove charges under investigation. Some day state boards will have full-time, well-trained investigators. Perhaps when that day comes relations will have developed to the point where the investigator may be loaned or the results of his investigation made available to the grievance committee or board of censors of the medical society.

By the same token, members of grievance committees and boards of censors should be willing to lend themselves, their time and their talent to help the boards conduct investigations. There are many cases where a doctor at community level can gather some small bit of information for the board, thus eliminating a trip for the board or its staff. The savings to the board would far outweigh the expense to the doctor.

We have heard of some unpleasant situations because attempts to cooperate were not fruitful or because there was no attempt to cooperate. A medical society should not concern itself with trying to punish a violation of the medical practice act and a board should not concern itself with trying to discipline for a violation of the Principles of Medical Ethics.

There are other medical society committees which should be included in this discussion of good relations—review or utilization committees. More and more, these committees will develop information that requires disciplinary action. It may well be that the board of medical examiners should be acquainted with this information.

Each committee and every board should make a report annually. This report should be considered

tangible evidence of the group's stewardship to the public and the profession.

The committee or board that does not believe it is obligated to the public and the profession is deluding itself. In those matters which effect or influence the physician-patient relationship, the patient has a right to know medicine is policing itself for patient's welfare. The sooner we realize the full extent of this obligation, the easier our task will be. We will appreciate that we are not sitting in judgment on our fellow physician but, instead, are resolving misunderstandings or preventing abuses which cause medicine to suffer.

The Report of the Medical Disciplinary Committee carried two exhibits which reported the disciplinary action taken in 1960 by state medical societies and state boards of medical examiners. These exhibits reported disciplinary actions *only* and this was the first time an effort was made to assemble national figures on medical discipline.

Despite these extenuating circumstances, it is unpleasant to note that 13 state boards and 31 state medical societies are listed as not having taken any disciplinary procedure at all during the year 1960. There may be, and undoubtedly are, reasonable explanations for these omissions. We need to know and we need to make public the number of disciplinary actions taken during the preceding year. Unless an adequate system of record keeping is maintained, unless reports are made by county societies to state societies, unless reports are made by state societies to their membership, and unless reports are made by state boards, full value will not be obtained from our efforts. It should go without saying that half the effect of disciplinary action is lost if the action is kept "top secret."

The Medical Disciplinary Committee suggests, "Each state board of medical examiners make an annual report of its disciplinary activities to the governor of its state, sending copies of its report to the state medical association, the American Medical Association, and to the Federation of State Boards."

These reports need not, and should not, contain names of the doctors called before the committee or board. The item of first importance is that discipline was taken or that a grievance was resolved. Following in order would be the number of actions taken, the nature of the complaint or offense, and finally, the disposition of the matter, that is, what punishment was imposed or what solution was reached.

Many county societies do report grievance committee activities in this manner. Their reports are educational to their membership. Their reports are valuable to all medicine. And their reports have not embarrassed anyone, nor have these reports precipitated litigation. On the contrary, these reports are concrete evidence that medicine is interested in its relations with the public.

As we discuss relations between medical society committees and state boards of medical examiners, we are aware that a discussion of the subject at a meeting like this does not exhaust it. We need to think more and talk more about relations between these two groups.

We can and should work together. Grievances, violation of ethical principles, violations of medical practice acts do occur. Our responsibility is to see that they do not occur. We must educate, we must discipline. As doctors, whether we represent a grievance committee, a board of censors, or a board of medical examiners, our ultimate goal is the same.

As we serve medicine and the public we must not permit our interprofessional relations to deteriorate. To the contrary, individually and collectively we must strive to make these relations as near perfect as humanly possible.

Your MEDICAL FACULTY at Work

JOHN SARGEANT EXECUTIVE SECRETARY

The Council at its January 25, 1968, session took the following actions:

1. Ratified Physicians' Defense for various members who requested it.
2. Denied Physicians' Defense for (a) a member who had failed to pay his dues by January 31 of the year in which the alleged offense occurred; and (b) a member whose application for membership was dated after the alleged offense occurred.
3. Heard that a case was considered closed because it was dismissed for want of prosecution and that judgment was entered in favor of the defendant for costs.
4. Approved recommending Emeritus membership to the House of Delegates for several members whose component society had requested it.
5. Remitted 1968 dues for a member on account of illness and at the request of his component society.
6. Voted to support the concept of legislation that would remove all reference to abortion from Maryland's criminal code; and leave this as a medical decision; and adopted "Guidelines for Hospital Medical Staffs for the Performance of Therapeutic Abortions."
7. Appropriated up to $200 from the educational fund for the purpose of conducting the 1968 Seminar on the Medical Aspects of Sports to be held in conjunction with the Catonsville Community College.
8. Approved a proposed Physical Examination Form and Guidelines for Medical Evaluation of Candidates for School Sports.
9. Adopted the report of the Ad Hoc Committee on PKU Legislation.
10. Deferred action on a recommendation dealing with Mumps Virus Vaccine.
11. Approved a recommendation that would establish a voluntary Central Cancer Registry under the auspices of the Faculty, in cooperation with the American Cancer Society and the Regional Medical Program.
12. Referred for further study a recommendation for Workshops on Cancer Detection.
13. Declined to take action on a proposal to oppose the transfer of Tuberculosis patients from City Hospital to Mount Wilson Hospital because this was in Baltimore City Medical Society jurisdiction.
14. Adopted an official statement dealing with Air Pollution.
15. Approved co-sponsorship of a Statewide Seminar on Respiratory Diseases, along with the Maryland Academy of General Practice, the Maryland Tuberculosis Association, the United States Public Health Service, the Maryland Thoracic Society and the State Department of Health.
16. Elected Arthur T. Keefe, MD, Chestertown, to succeed Eldridge H. Wolff, MD, deceased, as a councilor from the Eastern District.
17. Selected March 31, April 1 and 2 as the dates for the 1971 annual meeting in Baltimore.
18. Stated it would be receptive to a suggestion to hold the 1969 annual meeting at the new auditorium-seminar complex at The Johns Hopkins University School of Medicine; but asked for further details.

19. Recommended various Blue Shield Board and Committee appointments to the Nominating Committee of Blue Shield.
20. Approved the 1968 budget as recommended by the Treasurer and Executive Committee.
21. Authorized expenditure of up to $2,000 for employment of actuarial assistance if needed to develop statistical data or figures for discussion with the State Government or Legislators.
22. Authorized an official statement of the Council in connection with the current studies of fees paid to a certain group of physicians in the operation of the Title 19 program; and requested an audience with the Governor to discuss this. (see statement in full below)
23. Referred a proposal in connection with Health Manpower Recruitment to the Public Relations Committee for consideration and report.
24. Authorized a pilot program of information and education through distribution of pamphlets to selected patients, and approved expenditure of up to $500 from the educational fund for this purpose.
25. Requested the MEDIC Subcommittee to investigate other means of financing the MEDIC network than as is presently done through the Educational Fund at a cost of some $17,500 per year.
26. Rejected a proposal that the Faculty withdraw all sponsorship of overseas travel in accordance with the President's request.
27. Reaffirmed a previous decision that Blue Shield be used for the purpose of making payments under Maryland's Medical Assistance program.
28. Authorized the Professional Medical Services Committee to request formal approval of payment under Workmen's Compensation of the Physician's Usual Customary and Reasonable Fee.
29. Distributed a memorandum dealing with the AMA's reasons for non-participation by AMA on Educational Television in a national debate on Health Care.

STATEMENT OF COUNCIL ADOPTED THURSDAY, JANUARY 25, 1968 IN CONNECTION WITH TITLE 19 PROGRAM OPERATION IN MARYLAND

The Council of the Medical and Chirurgical Faculty of Maryland takes the position that it will continue to urge its physicians, for the time being, to support the Title 19 program. The matter will be reconsidered not later than the Council's March 28th meeting.

In the meantime, it is requesting an audience with the Governor and State legislative leaders to exchange information and to insist on a solution to the overall problems of the Title 19 program.

For the past 22 years, the medical profession has subsidized the medical care program to the extent of at least 10 million dollars per year. It is difficult to envision successful execution of a more comprehensive program for additional persons with a 2½ million dollar reduction in physicians' services from last year's budget, which was, in itself, grossly inadequate, especially since all other services in the proposed medical care program budget remain at the same level as last year, or have been increased. The physicians of Maryland would like to lend support in making the program more effective and more efficient by participation in improved program planning.

The Council expressed grave concern over whether or not physicians who have been singled out as receiving "exorbitant fees" under the Medicaid program will wish to continue caring for such patients. If they elect not to do so, it is a question of where these patients will receive their care.

Those physicians practicing in areas where the preponderance of patients are on public assistance deserve the undying gratitude of the medical profession, the public, the Governor and the Legislature.

Hospital outpatient departments are already overcrowded and overburdened with work. In addition, it would cost the state more than double the amount paid to physicians to take care of the same patient in a hospital outpatient department.

As revealed in discussions connected with this program, patients prefer receiving their care at the private physician's office, where more personalized service can be given.

CHRIS PAPADOPOULOS, MD, EDITOR

A service of the Heart Association of Maryland

THE RENIN-ANGIOTENSIN SYSTEM AND HYPERTENSION

GLENN D. LUBASH, MD
Associate Professor of Medicine;
Director, Division of Hypertension and Renal Diseases
University of Maryland School of Medicine
Established Investigator of the American Heart Association

In this year 1968, synthetic angiotensin is available in ampules, and human angiotensin which eluded isolation for just over a decade has now been characterized. Aldosterone assays are commonplace, plasma renin assays have become clinical tests in addition to research tools, and radioimmunoassays of angiotensin seem only a few years away from the same possiblity. Over the last 30 years a series of brilliant investigations have unraveled renin-angiotensin-aldosterone biochemical and physiological interrelationships. Expectations of concomitant understanding of the pathogenesis of hypertension have been only partially realized, however. At this time, it seems appropriate to review advances in this exciting area, to reassess the role of renin and angiotensin in blood pressure control, and to outline territory still in need of imaginative exploration.

Renin-Angiotensin System

Renin is manufactured, stored, and secreted by renal cortical juxtaglomerular (JG) cells located in the wall of afferent arterioles of the glomerulus. The specialized tubular macula densa cells of the ascending limb of Henle's loop are in intimate contact on one side with the renin-containing JG cells and on the other with tubular fluid leaving the loop of Henle. Thus, anatomical arrangements are such that changes in renal arterial perfusion pressure and in urinary sodium content can be appreciated by receptors located in these strategic sites. In response to decreased perfusion pressure or increased tubular sodium, the system is set in motion and renin secretion is enhanced. Renin is an enzyme with no known direct pressor function. It ruptures a leucine-leucine bond in its α-2 globulin substrate, and the biologically inactive decapeptide, angiotensin I, is released. A plasma substance called converting enzyme cleaves two additional amino acids to produce the octapeptide, angiotensin II, which has several important and potent biological activities.

Angiotensin II is by weight the most powerful pressor substance known. It also affects renal handling of salt and water in such a way that it is an antidiuretic in normals and a diuretic in severe hypertensive patients. This difference has never been adequately explained. Angiotensin II stimulates two adrenal gland functions as well: Catecholamine secretion is increased in acute experiments, and aldosterone secretion from the cortical zona glomerulosa cells is also increased. Under the influence of aldosterone, increased renal tubular potassium-for-sodium exchange results in sodium (and water) conservation. In the negative feed-back part of the system, these last changes signal the JG apparatus to decrease renin secretion. It should be apparent that salt and

water depletion will increase renin-angiotensin system activity and that repletion will decrease it. Thus, this biochemical and physiological chain-of-events exquisitely maintains salt and water homeostasis.

Clinical Variations

Clinical changes in plasma renin activity (PRA) are easily understood. Because of the slight decrease in renal plasma flow in the upright posture, PRA increases slightly compared to that in the recumbent position. Thus, there is some diurnal variation. PRA is also increased in the luteal phase of the menstrual cycle and during the third trimester of normal pregnancy, but these changes are less easily explained. PRA and serum sodium concentration are inversely correlated, and anticipated increases in PRA do occur in Addison's Disease and "salt losing" renal disease. Since other factors such as plasma volume also affect PRA, the situation in congestive heart failure is more complex. Expanded plasma volume will tend to decrease PRA and diuretics to increase it. Cirrhosis with ascites, nephrotic syndrome, and hemorrhage are frequently associated with serum hyponatremia or decreased plasma volume, and PRA may be elevated. Aldosterone excretion rates are also increased, presumably due to the influence of renin and angiotensin. The aldosterone excess is properly characterized here as "secondary." Blood pressure is most frequently normal (or even low) in these conditions.

In hypertension, the same inverse correlation with serum sodium holds, and this is the only constant relationship which is apparent. Etiology of hypertension, duration, severity, complications, and treatment do not seem to affect PRA. The only exceptions are (a) malignant or accelerated hypertension where increased PRA and secondary aldosteronism have been described and (b) antihypertensive therapy with diuretics where sodium balance is changed. In renovascular hypertension, PRA has been found to be normal and high, but the overlap of these results with those found in other hypertensive or normotensive states precludes diagnostic usefulness. More precise correlation of diagnosis with bilateral renal venous PRA and inferior vena cava PRA is presently being sought.

PRA determinations are extremely helpful in distinguishing between primary and secondary aldosteronism. In the primary situation, aldosterone secretion from the diseased adrenal gland (adenoma or hyperplasia) is autonomous. The hormonal action to produce salt retention causes suppression of renin secretion. Low or absent PRA results, and the suppression cannot be overcome by usual stimuli such as salt restriction, upright posture, and diuretic therapy. When PRA is normal, high, or responsive to positive stimuli and associated with increased aldosterone excretion, secondary aldosteronism is said to be present. In practice, PRA assays under these conditions supplement other means of testing for primary aldosteronism.

Blood Pressure Regulation

Though there is no apparent parallelism between renin and arterial pressure, some role for renin and angiotensin in blood pressure regulation may still be possible. Such a role must take into account another determinant of blood pressure response, sensitivity of the arterial wall smooth muscle target tissue.

In such conditions as cirrhosis, Addison's Disease, and pregnancy where serum sodium is low and PRA is high, pressor sensitivity to infused synthetic angiotensin II amide is decreased. Increased sensitivity has been demonstrated in reverse situations where sodium is high and PRA is low, eg, primary aldosteronism, DOCA excess, and salt-replete normals. Though renin (angiotensin) and blood pressure responsiveness vary in opposite directions, the amounts of circulating renin and angiotensin may be important determinants of the changed responsiveness to infused pressor substance. Stated another way, it seems quite possible that variable amounts of renin and angiotensin are required to raise blood pressure and that changes in plasma concentrations of these substances are important contributors to the response. That such variation in sensitivity to renin and angiotensin occurs within the clinical range of renin measurements has been documented in animals and supported by some studies in humans. The most likely factor responsible for these changes in vascular smooth muscle sensitivity seems to be redistribution of arterial wall electrolytes. In any case, the proposition that the renin-angiotensin system helps to regulate

blood pressure both by the amount of circulating renin and angiotensin and by related responsiveness to these same substances seems worthy of critical evaluation. How dietary sodium affects the pressor response remains to be explained.

Future Investigations

There are many unknowns and uncertainties in the overall renin-angiotensin scheme. The precise stimulus responsible for renin secretion must be further pinpointed within the JG apparatus or macula densa. Renin must be purified, characterized, and restudied physiologically. Assays of PRA are presently quite crude. Those of renin concentration are more accurate but also more cumbersome. Better methods for renin and angiotensin assay must be devised. Characterization of converting enzyme has not yet been possible. Various enzymes (angiotensinases) which degrade angiotensin *in vitro* may vary in some disease states and may have some role in blood pressure control. Clarification of the role of these proteins will probably not be possible until isolation of specific enzymes has been accomplished. The relationship of the renin-angiotensin system to catecholamine metabolism is an exciting new field for investigation. Variations in renin substrate could have a role in blood pressure regulation. Finally, the pathogenesis of essential hypertension has so far eluded definition on a renin-angiotensin system basis or, in fact, on any basis. These unanswered questions and others should stimulate continued and vigorous investigations.

Rubella Syndrome Subject of MEDIC Program

A comprehensive seminar on the identification and referral of rubella-damaged children will be presented over the MEDIC network Thursday, February 29, from 1 to 4 P.M. The possibility that as many as 6000 children may be victims of congenital rubella as a result of the 1964 epidemic has grave implications for educators as well as medical care personnel. The importance of identifying these children before they reach school age is the basis for the MEDIC presentation, a joint effort of the School Health Section of the Division of Maternal and Child Health, and the Exceptional Children's Committee of the Maryland State School Health Council.

HIGHLIGHTS

Additions to Laboratory Capabilities

The Biochemistry Division of the Bureau of Laboratories for more than a year has had the capability of automated blood sugar determinations on micro-quantities of blood for detection of diabetes in screening programs. Recently, the capabilities of automated procedures have been extended to determinations of blood cholesterol for guidance in assessing arteriosclerosis, blood uric acid for detection of gout, and blood urea nitrogen for evaluating kidney disease. (These multiphasic determinations have not yet been developed for micro-methods.) The addition of these increased capabilities in public health biochemistry will aid materially in programs for the early detection of previously unrecognized chronic illnesses in which early medical management can greatly improve community health.

Governor Rescinds Medical Assistance Cutback

On December 29, 1967, Governor Agnew directed that Medical Assistance to persons aged 21 through 64 be limited to federally-assisted categories. The action affected some 10% of the 270,000 eligible recipients. In response to petitions from various concerned sources, and after further consultation with his fiscal advisers, the Governor wrote to the Commissioner on January 5, 1968:

"I shall recommend to the 1968 General Assembly a deficiency appropriation of $5,000,000 for this program. Please make all administrative arrangements to continue to pay medical expenses of these 27,000 persons to the extent made possible by this additional appropriation."

The Governor warned, however, the program would face curtailment July 1, as continuation at the present level would require an $18,000,000 increase for the next fiscal year. He expressed the hope that the Federal plan would be revised to provide incentives for more efficient hospital operations, and requested the Department to appeal Federal regulations which presently prohibit the State from effecting economic restrictions in the program's provisions.

A-2 Influenza Confirmed

The Bureau of Laboratories' Division of Virology early in January isolated A-2 virus from specimens collected during a year-end outbreak of illness among high school students in Allegany County. This confirmed earlier serological studies which had shown "a significant rise in antibody titres to the A-2 type influenza." Isolations of para-influenza 3 virus from several Allegany County specimens and one from St. Mary's County indicate more than one virus may have been involved in the outbreaks of illness which have occurred in other counties of Maryland.

University of Maryland Food Service Facilities Found Lacking

A father's complaint that his daughter had been made ill by contaminated food served in a University of Maryland dining hall prompted a state senator to request inspection of the facilities by the Division of Food and Milk.

On receiving the Division's report of the preliminary inspection of one dining hall, the senator released the information to the press, which took intense interest in the ensuing inspection of this and other University food service areas. Less well publicized has been the response of University officials, who have taken steps to improve the areas where deficiencies were noted, and have promised cooperation with the Health Department to effect further needed improvements. Division sanitarians have found no evidence that food is inferior in quality at the time of delivery to the University.

Screening Program Locates New Diabetics

Diabetes screening during the past year in six Maryland locations tested 6,423 persons, mostly in the high risk group, with 142 new and 52 borderline cases identified and given intensive follow-up to insure that physician referrals were accomplished. These findings were reported by the Adult Services Division, Bureau of Chronic Diseases. Four of the screenings were in the Baltimore area (Fifth Regiment Armory, Jewish Community Center, Harlem Health Fair, Social Security Administration), others in Salisbury and Westminster. Co-operating with the State Health Department in the project were the Maryland Diabetes Association, Baltimore City and Wicomico Health Departments, the Social Security Administration's Medical Department, Maryland Pharmaceutical Association and the Women's Auxiliary of the Medical and Chirurgical Faculty.

During the recent Maryland Health Fair, an additional 3,551 persons were tested for diabetes with 387 screening positive. These individuals are being retested and referred to their local physicians for final diagnosis and treatment if necessary. Laboratory work for the screenings and retesting is being done by the Bureau of Laboratories. It is anticipated a considerable percentage will be identified as new diabetics.

Department Assists CBS Smoking Program

In cooperation with the Heart Association of Maryland, the Maryland Tuberculosis Association, the Maryland Division of the American Cancer Society, and the Maryland State Department of Education, the Health Department assisted in the distribution of more than 1 million National Smoking Test forms which were used in conjunction with an audience participation telecast January 16 over the CBS network. Most of the test forms were distributed through the public school system, to all pupils. Forms were also distributed through non-public schools, colleges, industries and retail druggists.

One part of the test, "Insight Development Questionnaire," was designed to give smokers a better understanding of what motivates them to smoke, and hopefully to help them quit the habit.

Clinical Laboratories in Maryland High in Performance

A recent proficiency testing program, conducted by the Bureau of Laboratories, revealed a relatively high level of performance in biochemical determinations performed by private clinical laboratories. Previously assayed blood serum specimens were distributed periodically to 98 hospital and clinical laboratories throughout the State, each laboratory performing three tests on each of seven constituents, or a total of 21.

In the determinations of serum chloride, sodium, calcium and total protein, 85% of the laboratories attained a score of at least 95% accuracy. In the determinations of glucose and potassium, 84% scored 90% or better. In urea determinations, 78% scored over 80% accuracy.

For the relatively few laboratories which showed poor proficiency in the tests, the Bureau will give consultation and training to improve performance. The proficiency testing program, offered on a voluntary basis by the Bureau for close to 20 years, is now mandatory under the 1966 Federal law and regulations governing clinical laboratories.

Newly appointed Chief of the Division of Certification and Field Services is Calvin B. Galloway, MD, RAdm, MC, USN (Ret.). During his naval career, Dr. Galloway commanded laboratory and research activities both in the United States and overseas.

Let's be specific about Campbell's Soups... and *reducing diets*

There are more than 30 million people in America who are overweight. During the next year, you probably will see more than 1,000 of them in your own practice.

One good way to help these patients is to give them a reducing diet based on ordinary eating patterns.

Campbell has prepared a sensible plan for weight control based on ordinary eating patterns. The plan consists of a patient instruction booklet and a set of menus which provide approximately 1,200 calories daily. The menus are balanced to provide the minimum daily requirements of nutrients.

To obtain a supply for your office write to:
Campbell Soup Company, Box 265, Camden, N. J. 08101

new evidence for TAO® (triacetyl-oleandomycin)

a macrolide antibiotic for the frequently seen respiratory infection in the office and for a problem pathogen* in the hospital.

*Staphylococcus aureus

study I[1]

Results of a 1967 in vitro—in vivo correlation study involving 116 patients with Gram-positive coccal infections in five institutions. All patients were given TAO prior to determining the susceptibility of the offending organism.

97.0%
of the organisms were susceptible to oleandomycin*

98.0%
of the patients responded favorably to TAO® (triacetyloleandomycin)

n some cases more than one pathogenic organism was solated from the patient.

study II[2]

Effect of oral therapy with TAO, erythromycin, and cloxacillin on the survival time of Rhesus monkeys after intravenous inoculations of lethal doses of staphylococci, phage type 80/81.
(8 monkeys in each group)

conclusion:

*Under the conditions of this study and the doses employed, it was found that

TAO® (triacetyl-oleandomycin)

was far superior to erythromycin, as was cloxacillin, a bactericidal agent, and of particular interest, "...bacteriostatic triacetyloleandomycin was as effective or perhaps superior to cloxacillin in preventing lethal (staphylococcal, phage type 80/81) infection."

*It should be pointed out that results obtained in an experimental study of this nature may not necessarily be directly extrapolated to the clinical situation as it pertains to man.

AO Rx Information

IDICATIONS: Include streptococci, staphylococci, pneumococci and gonococci. Recommended for acute, severe infections here adequate sensitivity testing has demonstrated susceptibility to this antibiotic and resistance to less toxic agents. **ONTRAINDICATIONS AND PRECAUTIONS:** Not recommended for prophylaxis or in the treatment of infectious processes nich may require more than ten days continuous therapy. In view of the possible hepatoxicity of this drug when therapy eyond ten days proves necessary, other less toxic agents should be used. If clinical judgement dictates continuation of erapy for longer periods, serial monitoring of liver profile is recommended, and the drug should be discontinued at the st evidence of any form of liver abnormality. When treating gonorrhea in which lesions of primary or secondary syphilis e suspected, proper diagnostic procedures, including darkfield examinations, should be followed. In other cases in which ncomitant syphilis is suspected, monthly serological tests should be made for at least four months. Contraindicated in e-existing liver disease or dysfunction, and in individuals hypersensitive to the drug. Although reactions of an allergic ture are infrequent and seldom severe, those of the anaphylactoid type have occurred on rare occasions. When used in reptococcal infections, therapy should be continued for ten days to prevent the development of rheumatic fever or omerulonephritis. The use of antibiotics may occasionally permit overgrowth of nonsusceptible organisms. A resistant fection or superinfection requires re-evaluation of the patient's therapy. In the event such occurs with this drug the edication should be discontinued, and specific antibacterial and supportive therapy instituted.

HALT DIARRHEA!
SHERIFF

LOMOTIL®

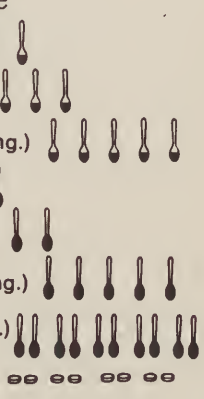
TABLETS / LIQUID

Each tablet and each 5 cc. of liquid contains:
diphenoxylate hydrochloride . . . . . 2.5 mg.
(Warning: may be habit forming)
atropine sulfate . . . . . 0.025 mg.

Halts Diarrhea Promptly

in children with . . . Gastroenteritis ▪ Spastic bowel
Influenza-like infections ▪ Antibiotic-induced diarrhea

Lomotil helps get children with diarrhea off toast and tea and back to normal diets and normal activity with gratifying dispatch. ▪ Lomotil lowers intestinal motility and permits absorption of excess fluid. This usually controls diarrhea promptly. ▪ Moreover, lowered intestinal motility achieved with Lomotil often relieves the abdominal cramps and discomfort so distressing to children.



Precautions: Lomotil is a Federally exempt narcotic preparation of very low addictive potential. Recommended dosages should not be exceeded, and medication should be kept out of reach of children. Should accidental overdosage occur signs may include severe respiratory depression, flushing, lethargy or coma, hypotonic reflexes, nystagmus, pinpoint pupils, tachycardia; continuous observation is recommended. Lomotil should be used with caution in patients with impaired liver function or those taking addicting drugs or barbiturates.

Side Effects: Side effects are relatively uncommon but among those reported are gastrointestinal irritation, sedation, dizziness, cutaneous manifestations, restlessness, insomnia, numbness of the extremities, headache, blurring of vision, swelling of the gums, euphoria, depression and general malaise.

Dosage: The recommended initial daily dosages, given in divided doses until diarrhea is controlled, are:

Children: Total Daily Dosage

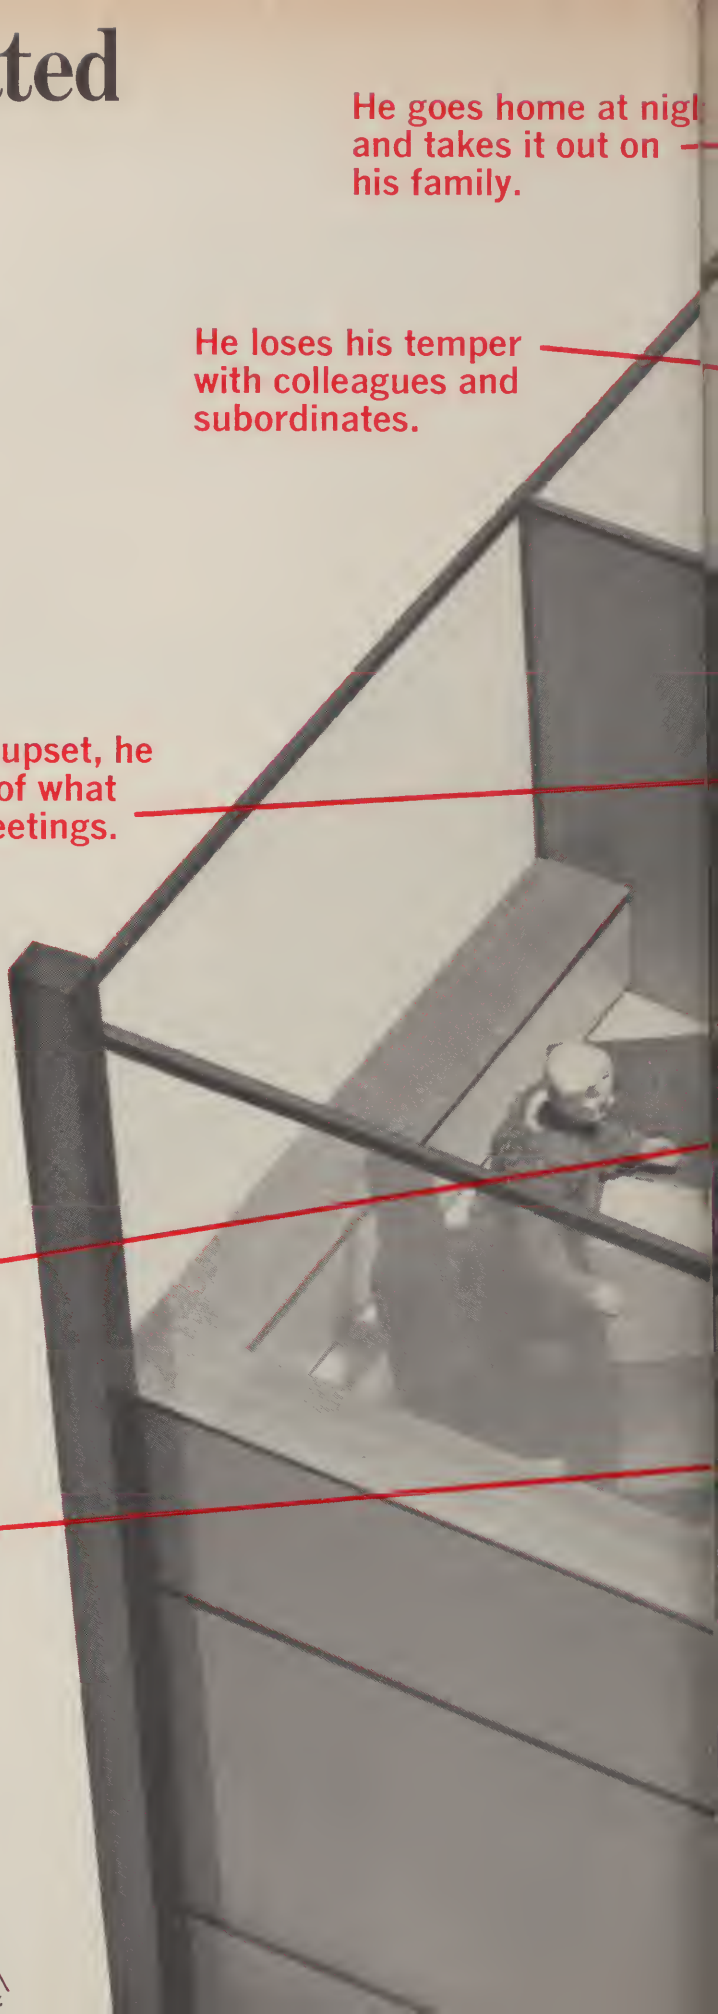
3-6 mo. . .½ tsp.* t.i.d. (3 mg.)
6-12 mo. .½ tsp. q.i.d. (4 mg.)
1-2 yr. . . .½ tsp. 5 times daily (5 mg.)
2-5 yr. . . .1 tsp. t.i.d. (6 mg.)
5-8 yr. . . .1 tsp. q.i.d. (8 mg.)
8-12 yr. . .1 tsp. 5 times daily (10 mg.)
Adults: . .2 tsp. 5 times daily (20 mg.)
or 2 tablets q.i.d.

*Based on 4 cc. per teaspoonful.

Maintenance dosage may be as low as one-fourth the initial daily dosage.

SEARLE *Research in the Service of Medicine*

When the agitated businessman goes to work...

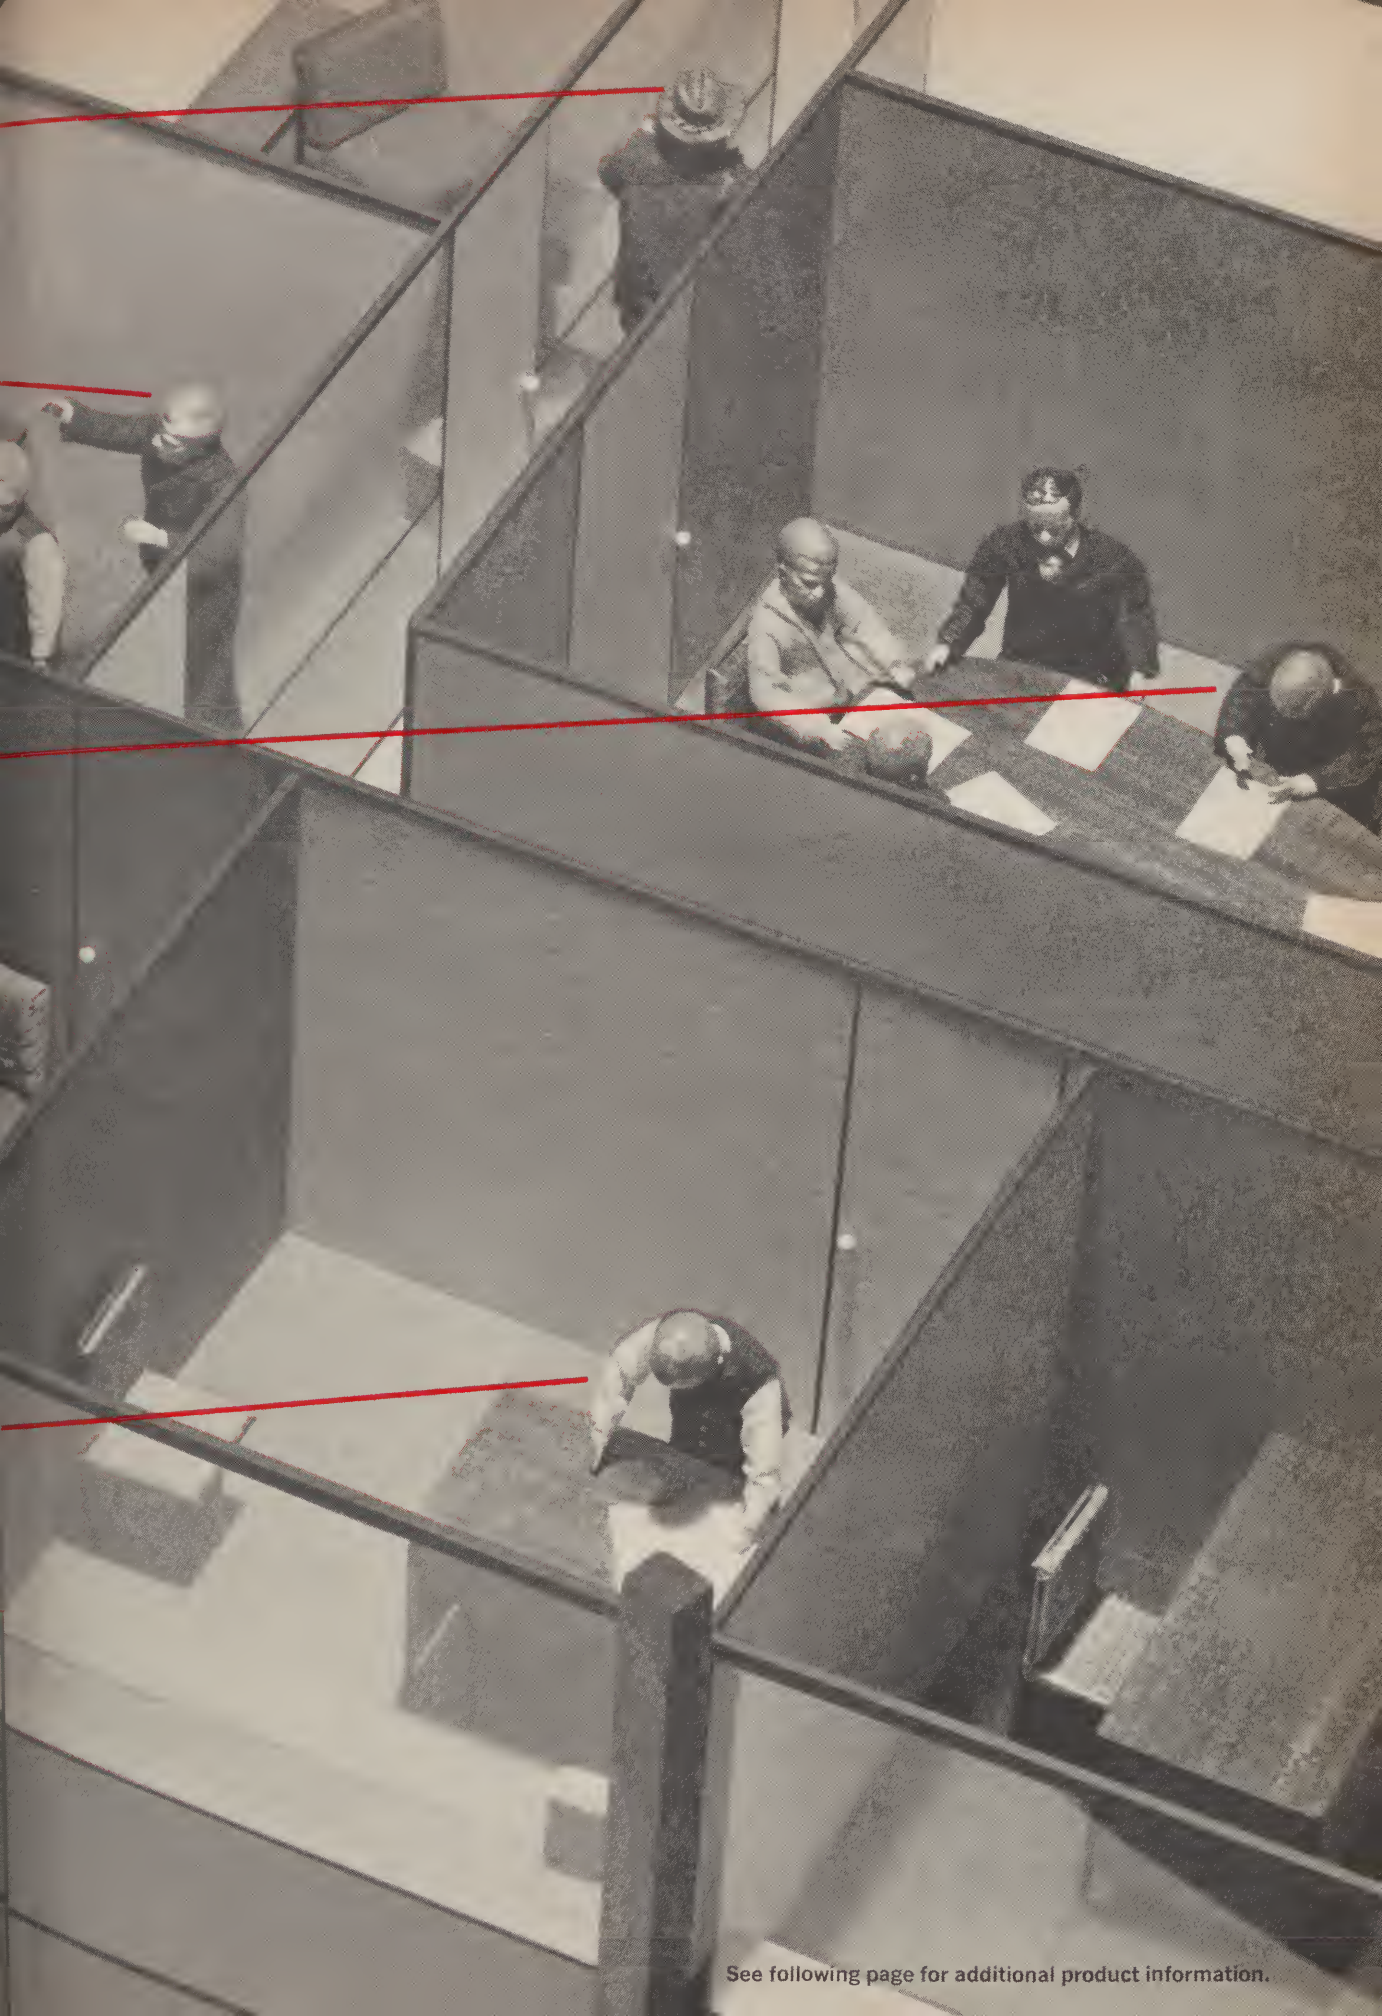


He goes home at nigl
and takes it out on
his family.

He loses his temper
with colleagues and
subordinates.

Emotionally upset, he
misses half of what
is said at meetings.

He is always fearful
about his standing
with the boss.



He just can't seem
to settle down
to his work.

for moderate to severe anxiety

Mellaril®
(thioridazine)
25 mg. t.i.d.

SANDOZ

See following page for additional product information.

When the agitated businessman goes to work...

Anxiety that *seriously interferes* with the individual's performance at work, at home, or in the community may be regarded as *moderate* to *severe* in degree.

Mellaril often recommends itself to the treatment of moderate to severe anxiety because it

- helps control the most frequent symptoms: marked tension, agitation, apprehension, restlessness, hypermotility
- often alleviates anxiety-induced somatic complaints
- frequently helps strengthen emotional resources
- helps the patient maintain realistic contact with environment, closer harmony with family

Thus, when you consider the anxiety moderate to severe... consider Mellaril.

Contraindications: Severely depressed or comatose states from any cause, and in association with or following MAO inhibitors; severe hypertensive or hypotensive heart disease.

Precautions: Hypersensitivity reactions (e.g., leukopenia, agranulocytosis) and convulsive seizures are infrequent. Pigmentary retinopathy has been observed where doses in excess of those recommended were used for long periods of time. May potentiate central nervous system depressants, atropine, and phosphorus insecticides. Where complete mental alertness is required, administer the drug cautiously and increase dosage gradually. In addition, orthostatic hypotension (especially in female patients) has been observed. Epinephrine should be avoided in treatment of drug-induced hypotension.

Side Effects: Pseudoparkinsonism and other extrapyramidal disorders are infrequent; drowsiness, especially in high doses early in treatment, may occur; nocturnal confusion, dryness of the mouth, nasal stuffiness, headache, peripheral edema, lactation, galactorrhea, and inhibition of ejaculation are noted on occasion; photosensitivity and other allergic skin reactions may occur but are extremely rare.

Before prescribing, see package insert for full product information.

for moderate to severe anxiety

Mellaril®
(thioridazine)
25 mg. t.i.d.

SANDOZ

mudrane®

for

- EMPHYSEMA
- ASTHMA
- CHRONIC BRONCHITIS
- BRONCHIECTASIS

The fast-disintegrating uncoated tablet gives relief in 15 minutes

Each tablet contains:

Potassium Iodide	195 mg.
Aminophylline	130 mg.
Phenobarbital, Caution: May be habit forming...	21 mg.
Ephedrine HCl	16 mg.

FEDERAL LAW PROHIBITS
DISPENSING WITHOUT PRESCRIPTION

Precautions: Usual for aminophylline-ephedrine-phenobarbital. Iodides may cause nausea, long use may cause goiter. Discontinue if symptoms of iodism develop.

Iodide contraindications: tuberculosis, pregnancy.

DOSAGE

One tablet, with full glass of water, 3 or 4 times daily.

Dispensed in bottles of 100 and 1000 tablets.

MUDRANE GG—Formula, dosage and package identical to Mudrane—*except*—100 mg. glyceryl guaiacolate replaces the potassium iodide. The value of Mudrane cannot be enjoyed by a small group in which K.I. is contraindicated. Mudrane GG is prepared for this group.

MUDRANE GG ELIXIR—Four 5 cc teaspoonfuls is equivalent to one Mudrane GG tablet. Dosage adjusted to age and weight of child. Mudrane GG Elixir is for pediatric patients and those who think they cannot swallow tablets. Dispensed in pint and half gallon bottles.

Woman's Auxiliary

MRS. HARRY L. BERMAN, EDITOR

Medical and Chirurgical Faculty

Since the last board meeting of the Auxiliary to the Medical and Chirurgical Faculty our President-elect, Margery Warres, has met with the Executive Committee of the Faculty to present the National 100% Membership Plan. If it is favorably received, this will enable all of the wives of doctors to become members without having to pay dues. We hope it materializes.

Newsletter Editor, Dottie Sunday, did yeoman service on the excellent issue of Hygeia Filiae which was made possible by the fine response many of the members gave her. She and I pool our information and we thank you most gratefully. Please continue to send us newsworthy items.

Congratulations to our Auxiliary for the $15 awarded us by the Woman's Auxiliary to the Southern Medical Association for the Best State-Wide Observance of Doctor's Day. Credits go to Nellie Robinson and Esther Cohen.

Although Allegany County extended invitations to all County Presidents and Health Careers Chairmen, only Elsie Goldstein and Louise Stone were present to hear Mrs. Herbert Ulrich, a national director of the AMA Woman's Auxiliary, speak excellently on Health Careers. Representatives from the faculties of local high schools and hospitals were in the audience to hear Mrs. Ulrich discuss present problems and the future possible solutions concerning health in the United States.

Alice Radman, AMA-ERF Chairman; Mrs. Genevieve Ritchie from the "Building," and Louise Stone visited the office of the Morris A. Mechanic Theatre, and have reserved 200 center front seats for the night of April 17th for the production of "You Know I Can't Hear You When the Water's Running." Direct from Broadway where it was favorably received by critics and audiences, this light and deliciously funny comedy will star Eddie Bracken. Since April 17th and 18th are the dates of the Annual Meeting of the Medical and Chirurgical Faculty it would be advisable to make plans early for an evening at the theatre. For more detailed information, write to Mrs. H. Melvin Radman, Esplanade Apts, Baltimore; or call Mrs. Ritchie at Med-Chi: Telephone 539-0872.

Elizabeth Linhardt is still working on her members-at-large and has had a response from each doctor's wife. An excellent piece of work.

Elizabeth von Fesus held a morning coffee for all the County International Health Chairmen.

"S.O.S. to all auxiliary members in regard to the Advertising Program of *MD'S WIFE*. The back cover of the January 1968 issue of *MD'S WIFE* will carry an advertisement for the Classics Club, with an attractive offer of three beautifully bound classics (Plato, Marcus Aurelius and Aristotle) for $1. This ad has been accepted under an arrangement whereby the company will pay for the advertising space at the rate of $3 per inquiry. A response of 3,000 inquiries therefore would mean $9,000 for the Auxiliary.

The response will not only affect the advertising revenue for this particular ad, but the AMA Advertising Department would like to have a heavy response to indicate to potential advertisers that *MD'S WIFE* is an effective and well-read advertising medium for their products.

It would be appreciated if YOU WOULD GET IN TOUCH immediately with as many doctors' wives as you can and ask them to clip the coupon, fill it in and mail it quickly to the address given in the ad. It is essential that 25 to 50 coupons come in from each state. At this time there is no more important action you could take to strengthen the Auxiliary's financial situation. Your help and cooperation will be greatly appreciated."

Very sincerely yours,
Margaret Wolfe, Executive Secretary

Baltimore City

A reminder of the Benefit Fashion Show Luncheon to be held Monday, March 11th at the Greenspring Inn Club. It has all the promise of an exciting afternoon. Call Dottie English for information; Telephone: ID 3-6648, or Jane James 433-5858.

when he just can't sleep

Tuinal

One-Half Sodium Amobarbital and
One-Half Sodium Secobarbital
supplied in ¾, 1½, and 3-grain Pulvules

Tuinal helps wakeful patients fall asleep fast, stay asleep all night.

Indications: Tuinal is indicated for prompt and moderately long-acting hypnosis. It is not suitable for continuous daytime sedation.

Contraindications: Barbiturates should not be administered to anyone with a history of porphyria, nor should they be given in the presence of uncontrolled pain, because excitement may result.

Warning: May be habit-forming.

Precautions: Tuinal should be used cautiously in patients with decreased liver function, since prolongation of effect may occur.

Adverse Reactions: Idiosyncrasy, such as excitement, hangover, or pain, may appear. Hypersensitivity reactions occur in some patients, especially in those with asthma, urticaria, or angioneurotic edema.

Overdosage: C.N.S. depression. Symptoms—Depression of respiration and of superficial and deep reflexes, slight constriction of the pupils (in severe poisoning, dilation), decreased urine formation, lowered body temperature, coma. Treatment—Symptomatic and supportive (gastric lavage; intravenous fluids; maintenance of blood pressure, body temperature, and adequate respiration). Dialysis may speed removal of barbiturates from body fluids.

Dosage: 50-200 mg. (¾-3 grains) at bedtime.

Baltimore City Health Department

ROBERT E. FARBER, MD, MPH, COMMISSIONER

Public Health In Baltimore In 1967

The following is a summary of some of the noteworthy public health events that took place in Baltimore during 1967. Much of the positive nature of this report is due to the valuable contributions of the physicians in the city, the state and city medical societies, our medical institutions, and the many official and non-official groups that are concerned with the health of our residents.

The solution of the negative aspects requires intensive efforts through new and continuing programs by all concerned. The following also presents some new Health Department approaches and observations on the solution of the city's significant health problems.

Positive Elements of the City's Health

1. The infant mortality rate estimated at 26.8 infant deaths per 1,000 liveborn is at the lowest level ever recorded. This is due to marked reduction in the infant loss among Negro liveborn and more particularly among infants born to mothers in deprived socio-economic circumstances.

2. The loss of life among mothers, due to childbirth, declined to the lowest level previously experienced in this City. Seven such deaths were recorded compared with 13 in 1966.

3. A further decline in fertility rates gave evidence of the widespread and increasing use of family planning practice in all segments of the community.

4. The reported cases of measles plunged to near eradication levels due to the continuous efforts of physicians in private practice and Health Department programs including the state-wide mass campaign conducted by the state and city medical societies and the health departments in cooperation with many community groups.

5. A mild 'flu' year accounted for a 20% drop in pneumonia deaths and also contributed to a 5% decline in deaths due to cardiovascular conditions.

The Problem Areas

1. The incidence of new cases of tuberculosis and the number of deaths due to tuberculosis changed insignificantly from the past three-years' experience and continues at relatively high levels.

2. The burgeoning number of cases of gonorrhea (6,685 in 1967) is indicative of widespread promiscuous sexual relationships.

3. A continuing high rate of early teen-age pregnancy as evidenced by approximately 1,000 births to girls 16 years of age and younger. This represents a problem of catastrophic social and economic significance.

4. A further rise in lives lost due to murder, reaching a new record level of 192, is also evidence of social pathology of unparalleled magnitude within the community.

5. A high rate of retarded verbal development in young school children.

6. Low levels of sanitation including rodent infestation in substantial areas of the city.

New Efforts

Among new efforts launched in 1967 to improve the health of the City's residents, several of the more important are:

☐ Establishment, as a permanent program, of a Bureau of Special Home Services to help the aged and chronically ill; ☐ The opening of two additional Comprehensive Pediatric Centers, one at the University of Maryland Hospital and the other at the Baltimore City Hospitals; ☐ The approval of a grant by the Office of Economic Opportunity to the Provident Hospital for the purpose of establishing a Neighborhood Health Center in West Baltimore; ☐ A rat eradication

program which was established in August with special funds made available by the Governor.

The problem of reducing pregnancy among adolescent girls is subject to partial solution by medical counseling and clinical services. Such services are gradually being expanded. More important, however, is initiative by social and church institutions to improve the physical, social and spiritual environment within which adolescent children grow. With this in mind, leading citizens and citizen groups as well as churches and such organizations as the Girl Scouts, Camp Fire Girls, and the YWCA are called upon to allocate more of their resources to those areas of the City within which adolescent girls mature under severely deprived circumstances.

During 1967, it became increasingly apparent that among those neighborhoods, where poor health conditions generally prevail, there was incisive recognition by individuals in these areas, that their prime need was for economic improvement through job opportunity and for adequate housing so that fundamental family functions could be carried out with some semblance of effectiveness. For this reason there is considerable merit to organization of public services on a neighborhood basis within the central part of the city so that the related efforts of job acquisition, economic assistance, housing improvement, and basic health and social services are integrated within a single complex and under a single local administrator. Hopefully, this approach to provide needed services will upgrade the health outlook and aspirations of our deprived citizens and will ultimately reflect benefits to all our citizens.

Rehabilitation Notes

DOUGLAS G. CARROLL, MD, EDITOR

CARDIAC REHABILITATION (PART IV) —A Coronary Care Unit

KENNETH B. LEWIS, MD
Assistant Chief Physician and
Chief Cardiovascular Division,
Baltimore City Hospitals
Assistant Professor of Medicine
The Johns Hopkins University
School of Medicine

The recognition of the frequency of cardiac arrhythmias in acute myocardial infarction, and the fact that much of the mortality is due to such electrical disturbances led to the development of special areas where patients with acute myocardial infarction could be admitted and connected to electronic monitors so that cardiac rhythm disturbances could be detected and treated. The concept of coronary care has evolved since 1962 when Hughes W. Day, MD, opened the first Coronary Care Unit in Kansas City, Kansas.

The Coronary Care Unit is similar in one respect to an Intensive Care Unit in that careful observation of patients is carried out by an especially trained group of nurses. Here, however, similarity ends. An intensive care area is usually a large open room, or a series of glass-enclosed rooms where the nursing staff can visualize all the patients from any point. There is often moderate noise due to respirators, suction apparatus, and other equipment.

The careful observation of coronary care should be carried out in a more tranquil setting. This is because after the initial pain has been controlled with drugs, the patient with a recent myocardial infarction may feel quite well. He is usually alert, well oriented, and quite aware of all of his surroundings. He is in need of a quiet restful area, free from noise and stress, in which to recuperate. The necessary noise and activity of an Intensive Care Unit may be quite upsetting to this type of patient and in that sense may offset the positive aspects of being on a cardiac monitor.

Initially, the purpose of a Coronary Care Unit was to immediately detect life-threatening arrhythmias such as ventricular tachycardia and fibrillation, and asystole, so that resuscitative measures could be instituted. As more experience has accumulated in managing patients in this setting, it has become apparent that many fatal arrhythmias are preceded by less serious warning arrhythmias. Thus, frequent premature ventricular contractions may appear as a sign of ventricular irritability before ventricular tachycardia occurs, or varying degrees of incomplete atrioventricular block may develop before complete heart block occurs. It is believed by many investigators that early treatment of these less serious arrhythmias with drugs and pacemakers prevents the development of fatal arrhythmias. It should be emphasized that obtaining statistically significant data to test this approach is difficult because it is almost impossible to get a truly comparable control group. The physician who has watched frequent premature contractions develop into ventricular tachycardia on several occasions is necessarily reluctant to allow this situation to go untreated for the sake of a controlled study.

The important principle in the development of coronary care should be that every patient with

acute myocardial infarction or suspected myocardial infarction should be admitted to this type of unit and monitored. A physician cannot predict which patient is going to develop a potentially serious arrhythmia. The relatively young patient with a myocardial infarction who is presently pain free and completely asymptomatic and resting in bed, may develop, without warning, a potentially fatal arrhythmia, and if not monitored may die because of this potentially treatable episode. It is this type of situation which Coronary Care Units are best suited to prevent.

In July, 1966 an eight-bed Coronary Care Unit was opened in one wing of a medical floor at the Baltimore City Hospitals. In the past 18 months, there have been 580 admissions to this area. The organization of the hospital is such that every patient seen in the Emergency Room with a myocardial infarction, or suspected myocardial infarction is admitted to the unit. If after three days of serial electrocardiograms and enzyme determinations there is no evidence of myocardial infarction, the patient is discharged or transferred to the medical floor for further evaluation. If a myocardial infarction is documented, the patient is kept in the unit for five days or until stable before being transferred to the medical floor for the remainder of his convalescence. It should be emphasized that patients are admitted for observation on the basis of history of prolonged characteristic chest pain with diaphoresis even if the electrocardiogram is normal. It is well known that characteristic electrocardiographic changes of myocardial infarction may not develop until some hours after the pain, and if patients are discharged from the office or Emergency Room on the basis of an electrocardiogram, some will be sent home while evolving a myocardial infarction.

The mortality rate for patients with proven myocardial infarction in the Coronary Care Unit has been 11%. The total overall mortality rate for admission with acute myocardial infarction is currently 17%. This discrepancy is accounted for by a number of patients who die after two to three weeks of hospitalization, while on the general medical floor, and apparently quite stable. The cause for these deaths is currently unknown because of lack of autopsy information. It is presumed that they are related to either re-infarction, arrhythmia without re-infarction, or possibly pulmonary embolization.

The management of various problems in this unit will be discussed below:

1. *General Nursing Care*—We feel that the care of the legs in these patients on bed rest for a period of time is quite important, and the nursing service encourages exercise of the feet against footboards which are present on all beds. Likewise, leg wraps with ace bandages are used constantly while a patient is in the unit. Patients are allowed to feed themselves and it is a rare exception when a patient is fed by the staff.

2. *Heart Failure*—Heart failure manifested by pulmonary edema is obviously treated with the usual measures including mercurial diuretics, bed rest, oxygen and digitalization. However, it has been our practice also to digitalize patients when they develop a clear left ventricular gallop or mild basilar rales and not to wait until more overt signs of failure are present. It has not been our experience that they are more prone to digitalis toxicity and we prefer to treat them at this point rather than take a chance that more severe failure will ensue. It should be emphasized that when these patients have recovered from their myocardial infarction and convalescent period, digitalis should be discontinued for a trial period and many patients will not have to have this drug reinstituted. We do not feel that chlorothiazide diuretics are indicated in the Coronary Care Unit because of their propensity for causing potassium depletion and the increased chance of cardiac arrhythmias.

3. *Myocardial Irritability*—We agree with Bernard Lown, MD, of Boston, that in the presence of ventricular irritability as manifested by premature ventricular contractions in the setting of acute myocardial infarction, suppressive therapy should be instituted. We use intravenous Xylocaine (*lidocaine hydrochloride*) almost exclusively and have been quite pleased with the response to this drug and the lack of side effects associated with it. We use intravenous Xylocaine in single injections of 50 to 100 mg and also as a constant intravenous infusion of approximately 100 mg per hour. If this or other drugs are used as an infusion, they should be given through a volume control set to prevent the inadvertent administration of larger quantities than anticipated. Our criteria for the administration of Xylocaine are greater than 10 unifocal premature ventricular contractions per minute, less than 10 multifocal

premature ventricular contractions per minute, coupled ventricular beats or runs of ventricular tachycardia. If evidence of ventricular irritability persists after 72 hours of an intravenous Xylocaine infusion, we place the patient on oral quinidine sulfate 300 mg every 6 hours.

4. *Heart Block*—Patients with 1st degree heart block are carefully observed but not specifically treated for this abnormality. If 2nd degree heart block develops, they are treated initially with intravenous Atropine and often times with this therapy the improvement in conduction converts this to 1st degree block. If 2nd degree block persists despite Atropine administration or if large quantities of Atropine are required to a point where Atropine toxicity may occur, we prefer to use a temporary transvenous pacemaker to manage these patients. In 3rd degree heart block we would immediately insert a temporary transvenous pacemaker. Once a pacemaker has been inserted it is our practice to leave it in for a minimum of two weeks connected to a Demand pulse generator. With this type of unit, a patient's intrinsic rhythm is maintained as long as it is adequate but if heart block should develop again or the heart rate should slow below a pre-set limit, the Demand unit would take over and pace the heart at whatever rate it was set. Heart block may recur some days removed from the initial myocardial infarction and, therefore, we believe it is safer to leave the pacemaker catheter in for this length of time. A number of deaths have been reported in patients who had recovered from heart block and had the pacemaker catheter removed and who subsequently developed again this conduction abnormality. The persistence of complete heart block after myocardial infarction is exceedingly rare and we have seen only one example of this. This means that one can reassure the patient when putting in a temporary transvenous pacemaker that the odds are very great that it will be only temporary.

Soon after a patient's admission to the coronary unit when his medical condition is stable, discussions should begin with him about what he can expect during his hospitalization. He should understand that as he improves he will no longer need the special facility of the unit and will be transferred to the medical floor. If this approach is used, the ultimate transfer out of the unit is looked upon as a positive step toward recovery rather than a sudden unexpected ousting from the protection of the unit. The convalescent period should also be used as a period of education for the patient as to his activities over the following weeks after discharge and his long term prospects. During this time patients are highly motivated to change habits which increase the risks of coronary disease. For instance, the heavy smoker who has been off of cigarettes for his three-week hospitalization may with discussion and encouragement not resume this habit when discharged. The obese patient or patient with hypercholesterolemia can receive dietary counsel in a setting where he is more likely to be motivated to follow it.

Finally it should be recognized that only 20-30% of patients dying of arteriosclerotic heart disease do so in the hospital and therefore have the opportunity to be cared for in a Coronary Care Unit. Public education to seek medical evaluation for chest pain and the development of special cardiac ambulances equipped with monitors and defibrillators and manned by specially trained personnel may hopefully decrease further the mortality from myocardial infarction.

(one tablet daily)

Regroton®

chlorthalidone 50 mg., reserpine 0.25 mg.

Indications: Hypertension. **Contraindications:** History of mental depression, hypersensitivity, and most cases of severe renal or hepatic diseases. **Warning:** With the administration of enteric-coated potassium supplements, which should be used only when adequate dietary supplementation is not practical, the possibility of small-bowel lesions (obstruction, hemorrhage, and perforation) should be kept in mind. Surgery for these lesions has frequently been required and deaths have occurred. Discontinue coated potassium-containing formulations immediately if abdominal pain, distention, nausea, vomiting, or gastrointestinal bleeding occur. Discontinue one week before electroshock therapy, and if depression or peptic ulcer occurs. *Use in pregnancy:* Regroton should be used in pregnant patients or in women of childbearing potential only when, in the judgment of a physician, its use is deemed essential to the welfare of the patients; adverse reactions (thrombocytopenia, hyperbilirubinemia, altered carbohydrate metabolism, etc.) are potential problems in the newborn.
Precautions: Antihypertensive therapy with Regroton should always be initiated cautiously in postsympathectomy patients and in patients receiving ganglionic blocking agents, other potent antihypertensive drugs, or curare. Reduce dosage of concomitant antihypertensive agents by at least one-half. To avoid hypotension during surgery, discontinue Regroton therapy two weeks prior to elective surgical procedures. In emergency surgery, use, if needed, anticholinergic or adrenergic drugs or other supportive measures as indicated. Because of the possibility of progression of renal damage, periodic kidney function tests are indicated. Discontinue if the BUN rises or liver dysfunction is aggravated. Hepatic coma may be precipitated. Electrolyte imbalance, sodium and/or potassium depletion may occur. If potassium depletion should occur during therapy, Regroton should be discontinued and potassium supplements given, provided the patient does not have marked oliguria. Take particular care in cirrhosis or severe ischemic heart disease and in patients receiving corticosteroids, ACTH, or digitalis. Salt restriction is not recommended. Use cautiously in patients with ulcerative colitis or gallstones (biliary colic may be precipitated). Bronchial asthma may occur in susceptible patients. **Adverse Reactions:** The drug is generally well tolerated. The most frequent side effects are nausea, gastric irritation, vomiting, diarrhea, constipation, muscle cramps, headache, dizziness and acute gout. Other potential side effects include angina pectoris, anxiety, depression, bradycardia and ectopic cardiac rhythms (especially when used with digitalis), drowsiness, dull sensorium, hyperglycemia and glycosuria, hyperuricemia, lassitude, restlessness, transient myopia, impotence or dysuria, orthostatic hypotension which may be potentiated when chlorthalidone is combined with alcohol, barbiturates or narcotics, leukopenia, aplastic anemia, skin rashes, thrombocytopenia, agranulocytosis, nasal stuffiness, increased gastric secretions, nightmare, purpura, urticaria, ecchymosis, weakness, uveitis, optic atrophy and glaucoma, and pruritus. Eruptions and/or flushing of the skin, a reversible paralysis agitans-like syndrome, blurred vision, conjunctival injection, increased susceptibility to colds, dyspnea, weight gain, decreased libido, dryness of the mouth, deafness, anorexia, and pancreatitis when epigastric pain or unexplained G.I. symptoms develop after prolonged administration. Jaundice, xanthopsia, paresthesia, photosensitization and necrotizing angiitis are possible. **Average Dosage:** One tablet daily with breakfast. **Availability:** Pink, single-scored tablets in bottles of 100 and 1000. (B) 46-600-B

emesis control

When the talk turns to oral contraceptives, it makes medical sense to remember low-dose Norinyl®-1.

(norethindrone 1mg. & mestranol 0.05mg.)

Turn page for contraindications, precautions and side effects.

Reduction of oral contraceptive dosage to the lowest effective levels is a well-accepted principle of conservative medical practice. In keeping with this view, Norinyl is now also available as Norinyl-1, containing exactly one half the previous dosage of norethindrone and mestranol. Clinical experience has established that effective fertility control can be achieved with the same degree of reliability and safety with new Norinyl-1 when taken as directed.

What about switching patients from higher dosage forms?

In transferring patients to low-dose Norinyl-1 from higher-dosage oral contraceptives, some breakthrough bleeding may occur in the early cycles. In the majority of cases the bleeding episode is mild and self-limited. The long-term advantages of the lower dosage form should be weighed against the inconvenience of possible breakthrough bleeding in the individual patient.

Contraindications: 1. Patients with thrombophlebitis or with a history of thrombophlebitis or pulmonary embolism. 2. Liver dysfunction or disease. 3. Patients with known or suspected carcinoma of the breast or genital organs. 4. Undiagnosed vaginal bleeding.

Warnings: 1. Discontinue medication pending examination if there is sudden partial or complete loss of vision or if there is a sudden onset of proptosis, diplopia or migraine. If examination reveals papilledema or retinal vascular lesions, medication should be withdrawn. 2. Since the safety of NORINYL-1 (norethindrone 1 mg. with mestranol 0.05 mg.) in pregnancy has not been demonstrated, it is recommended that for any patient who has missed two consecutive periods, pregnancy should be ruled out before continuing the contraceptive regimen. If the patient has not adhered to the prescribed schedule, the possibility of pregnancy should be considered at the time of the first missed period. 3. Detectable amounts of the active ingredients in oral contraceptives have been identified in the milk of mothers receiving these drugs. The significance of this dose to the infant has not been determined.

Precautions: 1. The pretreatment physical examination should include special reference to breast and pelvic organs, as well as a Papanicolaou smear. 2. Endocrine and possibly liver function tests may be affected by treatment with NORINYL-1. Therefore, if such tests are abnormal in a patient taking NORINYL-1 it is recommended that they be repeated after the drug has been withdrawn for two months. 3. Under the influence of estrogen-progestogen preparations, preexisting uterine fibromyomata may increase in size. 4. Because these agents may cause some degree of fluid retention, conditions that may be influenced by this factor, such as epilepsy, migraine, asthma, cardiac or renal dysfunction, require careful observation. 5. NORINYL-1 should be used with caution in patients with a history of cerebrovascular accident. 6. In relation to breakthrough bleeding, and as in all cases of irregular bleeding *per vaginam*, nonfunctional causes should be borne in mind. In cases of undiagnosed vaginal bleeding, adequate diagnostic measures are indicated. 7. Patients with a history of psychic depression should be carefully observed and the drug discontinued if the depression recurs to a serious degree. 8. Any possible influence of prolonged NORINYL-1 therapy on pituitary, ovarian, adrenal, hepatic or uterine function awaits further study. 9. A decrease in glucose tolerance has been observed in a small percentage of patients on oral contraceptives. The mechanism of this decrease is obscure. For this reason, diabetic patients should be carefully observed while receiving NORINYL-1 therapy. 10. Because of the occasional occurrence of thrombophlebitis and pulmonary embolism in patients taking oral contraceptives, the physician should be alert to the earliest manifestations of the disease. 11. Because of the effects of estrogens on epiphyseal closure, NORINYL-1 should be used judiciously in young patients in whom bone growth is not complete. 12. The age of the patient constitutes no absolute limiting factor, although treatment with NORINYL-1 may mask the onset of the climacteric. 13. The pathologist should be advised of NORINYL-1 therapy when relevant specimens are submitted.

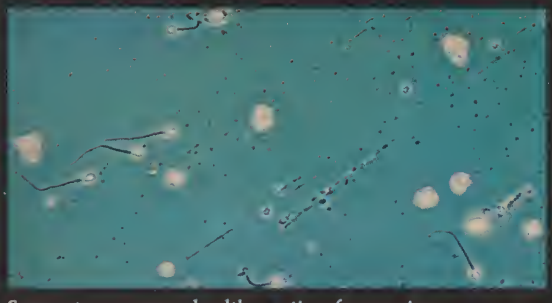
Side effects observed in patients receiving oral contraceptives: The following adverse reactions have been observed in patients receiving oral contraceptives: nausea, vomiting, gastrointestinal symptoms (such as abdominal cramps and bloating), breakthrough bleeding, spotting, change in menstrual flow, amenorrhea, edema, chloasma or melasma, breast changes (tenderness, enlargement and secretion), change in weig (increase or decrease), changes in cervical erosion and cervical secretio suppression of lactation when given immediately postpartum, cholestati jaundice, migraine, rash (allergic), rise in blood pressure in susceptible individuals, mental depression.

Although the following side effects have been reported in users of oral contraceptives, no cause and effect relationship has been established: anovulation post-treatment, premenstrual-like syndrome, chang in libido, changes in appetite, cystiti like syndrome, headache, nervousn dizziness, fatigue, backache, hirsutism, loss of scalp hair, erythema multiforme, erythema no sum, hemorrhagic eruption, itchin

The following occurrences have be observed in users of oral contracep tives (a cause and effect relationshi has been neither established nor d proved): thrombophlebitis, pulmon embolism, neuro-ocular lesions.

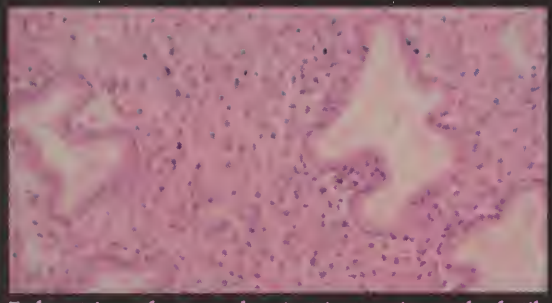
The following laboratory results may be altered by the use of oral contraceptives: increased sulfobromophthalein and other hepatic function tests, coagulation tests (increase in prothrombin, Factors VII, VIII, IX and X), thyroid function (increase in PBI and butanol extractable protein-bound iodine a decrease in T^3 values), metyrapone test, pregnanediol determination.

norethindrone — an original steroid from
SYNTEX
LABORATORIES INC., PALO ALTO, CALIF



Here's why Norinyl-1 makes medical sense.

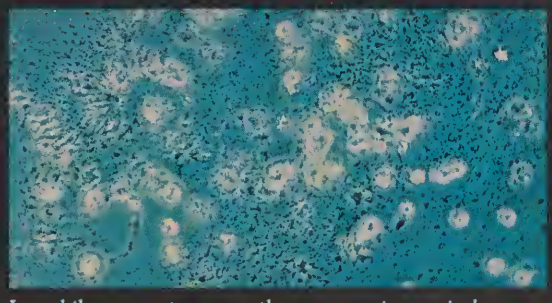
The effectiveness of Norinyl-1 as a low-dose oral contraceptive may be explained by its possible multiple action. In addition to its primary action of suppression of ovulation, Norinyl-1 may offer additional protective mechanisms... (1) creation of a cervical mucus that may be hostile to sperm penetration, and (2) development of an endometrium that may be out of phase with nidation. These effects are illustrated below.



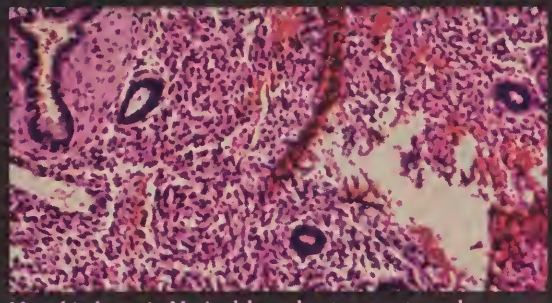
Untreated Patient

Cervical mucus at midcycle is usually thin and watery, with Spinnbarkeit (stretchability) of 15 to 20 cm.

Spermatozoa appear healthy, active, freemoving.



Endometrium of untreated patient is receptive to the fertilized ovum during secretory phase.



Norinyl-1 Patient

Cervical mucus at midcycle is scanty, viscous—with Spinnbarkeit of 1 cm. or less.

Immobile spermatozoa as they appear in cervical mucus taken from patient treated with Norinyl-1.

Norethindrone in Norinyl-1 accelerates secretory phase, suppresses glandular and vascular development.

Norinyl®-1 tablets
(norethindrone 1mg. & mestranol 0.05mg.)

- new low dose of time-proved ingredients
- established norethindrone/mestranol ratio
- lower patient cost

An uncommon steroid for common inflammatory dermatoses

In everyday topical steroid therapy, Synalar produces rapid resolution of inflammation and itching in steroid-responsive dermatoses—and at relatively low cost to the patient.

Advanced molecular design enhances potency

Synalar combines the advantage of earlier corticosteroid compounds with unique structural innovations. As a result, preparations of Synalar 0.01% and Synalar 0.025% have been reported to be more potent topically and significantly more effective than hydrocortisone 1.0%. The unique fluocinolone acetonide molecule provides one of the most useful topical corticosteroids for everyday practice.

Impressive clinical results in a wide range of dermatologic problems

The clinical efficacy of Synalar has been extensively documented in the world literature. Commonly encountered diseases such as allergic and contact dermatitis, eczematous and seborrheic dermatitis, and neurodermatitis respond rapidly to Synalar, often where previous therapy with other topical corticosteroids has failed.

Low patient cost for wider usefulness

With Synalar, a high degree of efficacy does not mean high price. And—a small quantity goes a long way. Thus, your patients can often obtain the "economy" of a hydrocortisone preparation with the proved efficacy of a potent, truly advanced steroid.

Synalar®
fluocinolone acetonide

Turn page for contraindications, precautions and side effects.

For everyday topical steroid therapy

Synalar® 0.01%

fluocinolone acetonide provides economy in two practical dosage forms

For general use, the most economical and widely applicable concentration of Synalar is 0.01% Cream in a water-washable, vanishing cream base. Synalar Solution 0.01% is especially valuable in dermatoses involving moist, intertriginous areas or hairy sites where creams and ointments do not spread or penetrate readily. Synalar Solution is a unique dosage form—clear, nongreasy, cosmetically elegant.

Product Information

Contraindications: Tuberculous, fungal, and most viral lesions of the skin (including herpes simplex, vaccinia, and varicella). Not for ophthalmic use. Contraindicated in individuals with a history of hypersensitivity to any of the components. *Precautions:* Synalar preparations are virtually nonsensitizing and nonirritating. However, the solution may produce burning or stinging when applied to denuded or fissured areas. In some patients with dry lesions, the solution may increase dryness, scaling or itching. Where severe local infection or systemic infection exists, the use of systemic antibiotics should be considered, based on susceptibility testing. While topical steroids have not been reported to have an adverse effect on pregnancy, the safety of their use on pregnant females has not absolutely been established. Therefore, they should not be used extensively on pregnant patients, in large amounts, or for prolonged periods of time. *Side Effects:* Side effects are uncommon with topical corticosteroids. As with all drugs, however, a few patients may react unfavorably to Synalar under certain conditions. In such cases the agent should be discontinued and appropriate measures taken. *Availability:* Synalar (fluocinolone acetonide) Cream 0.025%—5, 15 and 60 Gm. tubes and 425 Gm. jars. Cream 0.01%—15, 45 and 60 Gm. tubes and 120 Gm. jars. Solution 0.01%—20 and 60 cc. plastic squeeze bottles. Ointment 0.025%—15 and 60 Gm. tubes. Neo-Synalar® (neomycin sulfate 0.5% [0.35% neomycin base], fluocinolone acetonide 0.025%) Cream—5, 15 and 60 Gm. tubes.

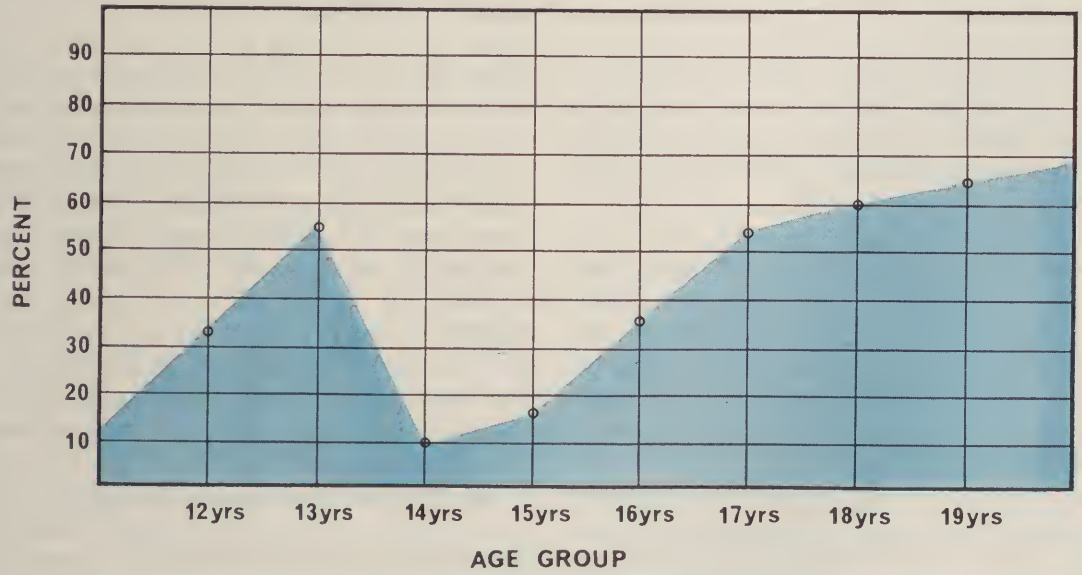
Pediatrics

Sponsored by the Maryland Chapter of the American Academy of Pediatrics

WILSON L. GRUBB, MD, CHAIRMAN
RAY HEPNER, MD, EDITOR

THE UNWED TEENAGE MOTHER



LOUIS RANDALL, MD

The pregnant teenager constitutes approximately 45% of all gestations in the city of Baltimore. By teenage pregnancy, one means all gestation ending before the 20th birthday. In Baltimore City, in 1964, there were 4,551 deliveries occurring to mothers from age 11 to 19.

It can be seen from studying the graph below, the greatest number of illegitimate babies are born to mothers from age 12 through 17, and a small decrease in illegitimacy occurs around age 18 to 19.

A more distressing factor is that the rate of illegitimacy is higher in the lower economic groups. One must remember, however, that quite often other economic groups shield their girls, therefore, no conclusive statistics are available for the overall pregnancy rate in all unmarried teenagers.

From available statistics, it is known that on a national level, the total number of illegitimate births in 1964 was 276,000 as compared to 176,000 in 1954. But the ratio of the number of births out of wedlock per every 1,000 unmarried women of child-bearing age has been fairly steady for the past decade. In fact, the rate has been plateaued or leveled off for the past seven years. Rates for

Study of Legitimacy of Live Births Born to Teenage Mothers in Baltimore in 1964.

teenagers have increased less than for other groups and for those under 15 years, the rate has not increased since 1947.

The factors leading to extramarital pregnancies are difficult to evaluate. In about 75% of patients seen (based on the author's experience) pregnancy followed naturally enough from the pursuit of adolescent practices normal to the whole society. It arose from a "deliberate choice of a mate, usually from the same occupational level, and from deliberate association with him. On the other hand, 25% of pregnancies resulted from such factors as rebellion against authority, a desire to punish a parent, or a reluctance to behave in a more conservative manner than contemporaries. A parent's excessive restraint or attitude toward sex may enhance the adolescent's effort to deny parental control, or wanting to be grown up and not feeling that he or she is, and wanting to take on the trappings of adult life and yet avoid its responsibilities. We find adolescents copying adults in their dress, staying out late, drinking, smoking, wanting a job and wanting to leave home, and experimenting in heterosexual behavior" according to Gallagher in *Medical Care of the Adolescent*. Furthermore, when the adolescent boy is struggling to emerge into the adult world he has his own misgivings and feels the heterosexual experience will settle doubts about his own masculinity.

In advanced societies, there is an attempt to impose so-called social childhood on youth. For example, keeping a child in school and ostensibly in subjection long past the age at which a child reaches physical maturity. When we consider it unnatural for young people between the ages of 15 and 20 to have sexual knowledge or experience, we have redefined childhood on a social rather than a physiological basis.

Our society envisions childhood ending, not at puberty with its dramatic physical termination, but at the completion of a prolonged educational experience or apprenticeship. The social children of our society have been physiological adults for years and we are upset because they behave according to their physiological state rather than conforming to our social definition.

An additional influence that has intensified problems of the teenager is that both sexes now reach puberty earlier than past generations. In 1858, the average age of the first menstruation was 17 years; in 1950, it had dropped to 13.7 years.

Also, in the teen years a strong sexual drive develops earlier in boys than in girls, the basis, perhaps, for the "double standard." There is little doubt the girl can more easily control the extent of heterosexual activity she will engage in. But from an anthropological point of view it is difficult to understand why, when they have the opportunity, most pubescents refrain from sexual intercourse. Many factors operate to control teenagers —there is their own self love, a possible fear of detection, pregnancy and disease, and in younger boys, their relationship to their mother acts as a taboo.

From observation of unwed teenage mothers in the Obstetrical Family Clinic of Sinai Hospital (Baltimore), it is interesting to note the lower the socio-economic class, the greater the chance for illegitimate birth, the greater the incidence of prematurity, and the greater the chance for toxemia (HBP, albuminuria, excessive weight gain).

The physician's function is to attempt to adjust any contributing factor such as doubts of femininity, feelings of unpopularity, rebellion, etc. and to offer support. Through gaining the girl's esteem, the physician can modify and enlarge her concept of a mature adult love relationship.

In the Sinai Clinic, the physicians use the multidisciplined approach to the problem of the unwed teenage mother with focus on the family as a basis for study and orientation of goals. Each patient seen in the Obstetrical Family Clinic receives the services of a team that includes two obstetricians for birth of the child and birth-control instructions; a resident doctor for pre- and post-natal care; a social worker for family counseling; a psychologist and a psychiatrist for group therapy; a pediatrician for child health care education; and public health nursing service which coordinates many of the activities mentioned.

Infants born of the Obstetrical Family Clinic are enrolled in the Pediatric Family Clinic. Maternal patients are interviewed, initially by a professional interviewer, and then approximately every 6 months for 3 years thereafter.

Whether the multidisciplined approach of the Sinai Clinic is the answer to the problem of preventing repetition of illegitimacy, remains to be seen.

State of Maryland
Department of Mental Hygiene

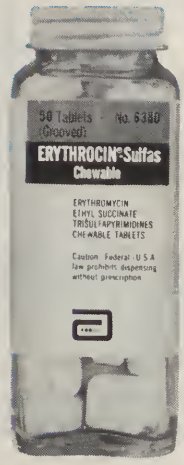
ISADORE TUERK, MD, COMMISSIONER
KURT GORWITZ, ScD, STATISTICS DIRECTOR

Retention And Release Rates Of Geriatric Admissions

Ten percent of all persons 65 years of age or older entering Maryland's mental hospitals died within four weeks after admission and mortality exceeded one-third within one year. An additional one-third were discharged or placed on long-term leave. The retention and release rates of the 931 geriatric patients admitted during the year ending June 30, 1965 are summarized in the following table.

	CUMULATIVE PERCENT			
Time Period	Died in Hospital	Discharged from Hospital	Placed on Long-term Leave	Percent in Hospital at End of each Period
Less than 7 Days	2.5	1.3	0.5	95.7
7–27 Days	9.9	6.0	3.1	81.0
1–3 Months	24.0	11.6	11.6	52.8
4–6 Months	29.0	12.7	15.0	43 3
7–11 Months	35.4	14.2	18.2	32.2
1–3 Years	47.4	16.2	22.6	13.8

Of these 931 patients, 47.4% have now died in the hospital, 38.8% have been discharged or placed on long-term leave with the remaining 13.8% still hospitalized. While many of the 301 released patients are now in the community or in nursing homes, some have died or have been rehospitalized.



These data reflect a mortality rate very greatly exceeding comparable statistics for the general population which cannot be explained by socio-economic variations alone. They indicate that many of these older residents are admitted with concomitant major physical and mental illnesses and find the sudden transition from community to hospital traumatic. Four out of five had not previously been under psychiatric care and their current condition was diagnosed as primarily related to old age. As such, they raise dual questions regarding the propriety of accepting such individuals as mental hospital patients and the need for more appropriate community facilities.

Currently, 2,400 of the 7,800 patients in Maryland's mental hospitals (or 30% of the total) are geriatric. Primarily because of excess mortality among recent admissions, only 18.7% have been under care for less than one year. Conversely, 44.0% have been hospitalized continuously for 10 years or more. Most in this latter group were admitted at an earlier age for psychotic disorders and a significant reduction in their number is dependent on minimizing chronicity in hospitalized patients. The success of efforts to reduce the number of geriatric admissions is dependent primarily on providing alternative community based preventive and treatment programs. Of major importance is the establishment, expansion and improvement of state licensed and inspected nursing homes and the development of services in general hospitals for the treatment of concomitant physical and mental illnesses.

Perhaps there have been times when you wanted to prescribe erythromycin and triple sulfas for little patients. Now you can—with a choice of two new fine-tasting pediatric forms.

New–Two Pediatric Forms of Erythromycin and Triple Sulfas

ERYTHROCIN®-SULFAS Chewable (Erythromycin ethyl succinate-trisulfapyrimidines chewable tablet)

In clinical trials[1,2], this orange-flavored tablet was given to 55 patients, aged four months to 18 years.

Diagnoses (multiple in some cases) represented a cross section of bacterial infections commonly seen in pediatric office practice.

Therapy was given from three to 12 days, with an average of six days.

Of the 55 patients, 30 were reported cured within 72 hours, while 22 showed partial recovery within the same time, and subsequent clinical cure.

A clinical cure rate of 94.5%

ERYTHROCIN®-SULFAS Granules (Erythromycin ethyl succinate-trisulfapyrimidines granules for oral suspension)

87 patients were treated[1,2]—all children, ages four months to 15 years.

The diagnoses were multiple in some cases and were chiefly bacterial infections of the respiratory tract.

Dosage was maintained from three to 10 days; average treatment was five days. All of the ill children accepted the orange-flavored suspension favorably.

53 were clinically cured within 72 hours, while 32 showed partial relief within the same time, and subsequent clinical cure.

701358

A clinical cure rate of 97.7%

ABBOTT

Brief Summary on next page

ERYTHROCIN®-SULFAS
Brief Summary

Contraindications: Known sensitivity to erythromycin or sulfonamides. Because of the possibility of kernicterus with sulfonamides, do not use in pregnancy at term, premature or newborn infants.

Warnings: As with other forms of sulfonamide therapy, carefully evaluate patients with liver or kidney damage, urinary obstruction, or blood dyscrasia. Deaths have been reported from hypersensitivity reactions and blood dyscrasias following use of sulfonamides. Perform blood counts and liver and kidney function tests if used repeatedly at close intervals or for long periods.

Precautions, Side Effects: Occasionally mild abdominal discomfort, nausea or vomiting may occur with erythromycin, generally controlled by reduction of dosage. Mild allergic reactions (such as urticaria and other skin rashes) may occur. Serious allergic reactions have been extremely infrequent. Use sulfonamides with caution in patients with a history of allergy. Assure adequate fluid intake to prevent crystalluria and institute alkali therapy if indicated. If overgrowth of nonsusceptible organisms occurs, withdraw the drug and institute appropriate treatment. If a patient should show signs of hypersensitivity, appropriate countermeasures (e.g. epinephrine, steriods, etc.) should be administered and the drug withdrawn.

Adverse Reactions: Sulfonamide therapy may be associated with headache, nausea, vomiting, urticaria, diarrhea, hepatitis, pancreatitis, blood dyscrasias, neuropathy, drug fever, skin rash, injection of the conjunctiva and sclera, petechiae, purpura, hematuria and crystalluria.

Side effects due to erythromycin are infrequent, but occasional abdominal discomfort, nausea, or vomiting, urticaria and other skin rashes may occur.

Supplied: The Granules for Oral Suspension come in bottles of 60 ml. and 150 ml. The Chewable tablets are in bottles of 50. Each 5-ml. teaspoonful of reconstituted Granules or each Chewable tablet provides erythromycin ethyl succinate equivalent to 125 mg. of erythromycin activity and 167 mg. of each of sulfadiazine, sulfamerazine and sulfamethazine.

Abbott Antihypertensive Building Blocks

A simplified approach to the practical management of hypertension

Enduron: (methyclothiazide) A basic building block for mild hypertensives

Excellent day-long Na^+ output, yet easy on the K^+

Enduron provides an excellent starting therapy. Your patient's sodium excretion is greatly enhanced. Yet potassium loss is low

The therapeutic action is smooth, and persits for a full 24 hours With Enduron you can prescribe convenient once-a-day dosag without skimping your patients on day-long thiazide effectiveness

Of course, as with all thiazides, supplemental dietary potassiur should also be considered.

Use Enduron as a basic therapy in patients with mild to moc erate hypertension. A single 5-mg. tablet each day is ample i most cases.

Once a day, every day

ENDURON®

METHYCLOTHIAZIDE

See Brief Summary on final page of advertisement

Enduronyl: Its deserpidine component adds response in moderate hypertension

Less frequent rauwolfia side effects than with reserpine

When you wish to build further response, consider shifting to Enduronyl.

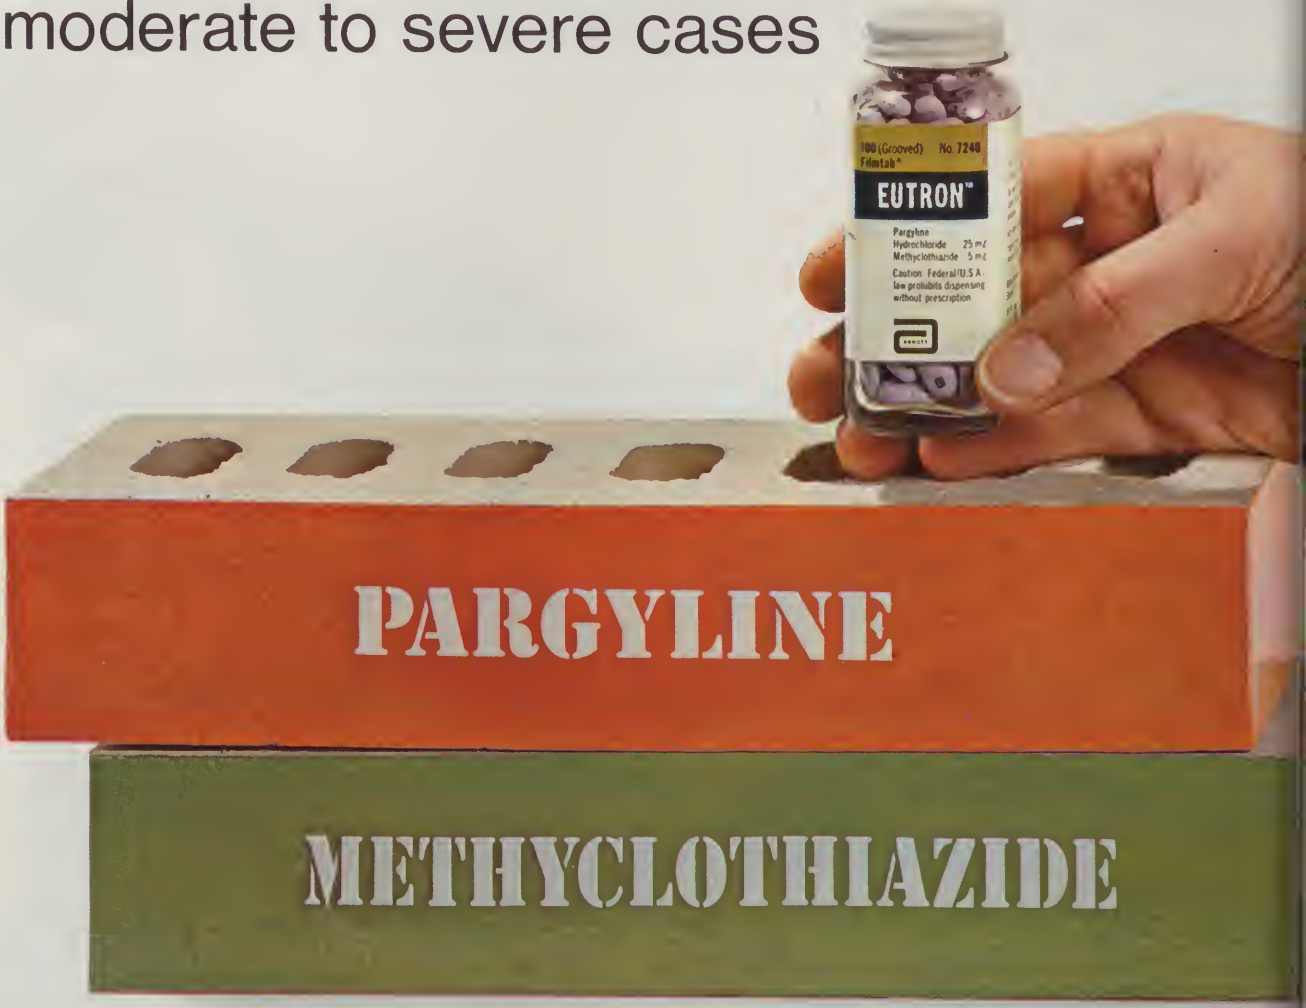
Enduronyl adds a building block of *deserpidine*. This is a purified rauwolfia alkaloid available only from Abbott. It adds good antihypertensive and tranquilizing activity. Yet its incidence of untoward effects, particularly lethargy and depression, is lower than with reserpine.

Enduronyl is available plain or Forte. The latter provides its variation where most helpful, by doubling the deserpidine.

Use Enduronyl for patients throughout the broad range of mild to moderately severe hypertension.

)nce a day, every day

ENDURONYL®



ETHYCLOTHIAZIDE 5 mg. with
SERPIDINE 0.25 mg. or (FORTE) 0.5 mg.

See Brief Summary on final page of advertisement

801094

Eutron: A unique combination for handling moderate to severe cases

Affords almost uniform diastolic reduction in all body positions

Eutron lowers diastolic pressures nearly equally, whether your patient is standing up or lying down.

Thus, in clinical trials, average *standing* diastolic readings were reduced from 112 pre-treatment to 90 post-treatment; *sitting* from 115 to 95; and *recumbent* from 112 to 94.

Note that following Eutron, the diastolic reductions were nearly alike in all three body positions.

Use Eutron for managing your moderate to severe cases. Its building blocks enhance each other; hence lesser doses often suffice

Once a day, every day

EUTRON™

PARGYLINE HYDROCHLORIDE 25 mg.
with METHYCLOTHIAZIDE 5 mg.

MILD TO MODERATE TO SEVERE

See Brief Summary on final page of advertisement

8010

ENDURON® | ENDURONYL®

METHYCLOTHIAZIDE

Each tablet contains
Methyclothiazide 5 mg. with
Deserpidine 0.25 mg. or 0.5 mg

Indications: Edema and mild to moderate hypertension (Enduron), and mild to moderately severe hypertension (Enduronyl). More potent agents, if added, can be given at reduced dosage.

Contraindications: Sensitivity to thiazides; severe renal disease (except nephrosis) or shutdown; severe hepatic disease or impending hepatic coma (hepatic coma due to hypokalemia has been reported in patients on thiazides). Do not use Enduronyl in severe mental depression, suicidal tendencies, active peptic ulcer, or ulcerative colitis.

Warnings: Consider possible sensitivity where there is history of allergy or asthma. If added potassium is indicated, dietary supplementation is recommended. Reserve enteric-coated potassium tablets for cautious use only when necessary, as they may induce serious or fatal small bowel lesions (stenosis with or without ulceration), cause obstruction, hemorrhage, and perforation often requiring surgery; discontinue them immediately if abdominal pain, distention, nausea, vomiting, or g.i. bleeding occurs. Neither Enduron nor Enduronyl contains added potassium.

Precautions: Use thiazides cautiously in severe renal dysfunction, impaired hepatic function or progressive liver disease; also in pregnancy (bone marrow depression, thrombocytopenia, and altered carbohydrate metabolism have been reported in certain newborn). In surgery, thiazides may reduce response to vasopressors, and increase response to tubocurarine. Antihypertensive response may be enhanced following sympathectomy. Watch for electrolyte imbalance (e.g., hyponatremia) in all patients. In hypokalemia (especially in digitalized patients) give supplemental potassium. In hypochloremic alkalosis, give supplemental chloride.

Use rauwolfias with caution in patients with history of peptic ulcer. Rauwolfias with anesthetics may produce hypotension and bradycardia. Discontinue Enduronyl two weeks before elective surgery. Consider vagal blocking agents during emergency surgery. In epilepsy, adjust anticonvulsant dosage. In electroshock, shorten stimulus strength and duration. In occasional patients with depressive tendencies, rauwolfias may precipitate severe mental depression that usually disappears when drug is stopped.

Adverse Reactions: Thiazide reaction include blood dyscrasias (thrombocytopenia with purpura, agranulocytosis, aplastic anemia); elevation of BUN, serum uric acid or blood sugar; anorexia, nausea, vomiting, diarrhea, headache, dizziness, paresthesia, weakness, skin rash, photosensitivity, jaundice, symtomatic gout, and pancreatitis. Cutaneous vasculitis in the elderly has been reported with other thiazides. Adverse effects with deserpidine are qualitatively similar to those with reserpine, but their incidence is lower. These include nasal stuffiness, abdominal cramps or diarrhea, nausea, headache, weight gain, reduced libido and potency, peptic ulcer aggravation, epistaxis, skin eruption, asthma in susceptible patients, electrolyte imbalance, excessive salivation, and a reversible Parkinson's syndrome. Excessive drowsiness, fatigue, weakness, and nightmares may signal mental depression. Thrombocytopenia, purpura, and a symptom manifested by dull sensorium, deafness, uveitis, glaucoma, and optic atrophy are rare allergic reactions to other rauwolfias. Hypotension from antihypertensive agents may precipitate angina attacks in susceptible individuals. Usually adverse reactions disappear when drug is withdrawn.

EUTRON™

Each tablet contains
Pargyline Hydrochloride 25 mg.
with Methyclothiazide 5 mg.

Indications: For treatment of patients with moderate to severe hypertension, especially those with severe diastolic hypertension. Not recommended for patients with mild or labile hypertension amendable to therapy with sedatives and/or thiazide diuretics alone. It is desirable to establish the dosage of Eutron by administering component drugs separately.

Contraindications: Pheochromocytoma, advanced renal disease, increasing renal dysfunction, paranoid schizophrenia and hyperthyroidism. Hepatic coma has been reported as consequence of hypokalemia with thiazide therapy. Until further experience is gained not recommended for patients with malignant hypertension, children under 12, or pregnant patients.

Concomitant use of the following is contraindicated: other monoamine oxidase inhibitors; parenteral forms of reserpine or guanethidine; sympathomimetic drugs; foods high in tyramine such as cheese; imipramine and amitriptyline, or similar antidepressants; methyldopa. 2 week interval should separate therapy and use of these agents.

Methyclothiazide is contraindicated in patients with known sensitivity to thiazides.

Warnings: Pargyline hydrochloride is a monoamine oxidase inhibitor. Warn patients against eating cheese, and using alcohol, proprietary drugs or other medication without the knowledge of the physician. When indicated, alcohol, narcotics (meperidine should be avoided), antihistamines, barbiturates, chloral hydrate, and other hypnotics, sedatives, tranquilizers, or caffeine, may be used cautiously in reduced dosage. In emergency surgery ¼ to ⅕ the usual dose of narcotics, analgesics, and other premedications should be used avoiding parenteral administration where possible. Carefully adjust dose of anesthetics to response of patient. Withdraw pargyline two weeks before elective surgery.

Warn patients about the possibility of postural hypotension. Those with angina or coronary artery disease should not increase physical activity with an improvement in well being. Pargyline may lower blood sugar.

Avoid use of enteric-coated potassium tablets, as these may induce serious or fatal small-bowel lesions consisting of stenosis with or without ulceration. These small-bowel lesions have caused obstruction, hemorrhage and perforation frequently requiring surgery. Medication should be discontinued immediately if abdominal pain, distension, nausea, vomiting or GI bleeding occurs. These products contain no added potassium salts and if added potassium intake is desired, dietary supplementation is recommended. Coated potassium tablets should be reserved for cautious use when adequate dietary supplementation is impractical. In patients with a history of allergy or asthma the possibility of sensitivity reactions should be considered.

Precautions: Measure blood pressure while patient is standing to determine antihypertensive effect. Use with caution in hyperactive or hyperexcitable persons. Such persons may show increased restlessness and agitation. Withdraw drug during acute febrile illness. Watch patients with impaired renal function for increasing drug effects or elevation of BUN and other evidence of progressive renal failure; withdraw drug if such alterations persist and progress. Use with caution in patients with liver disease. As with all new drugs, complete blood counts, urinalyses, and liver function tests should be performed periodically. With prolonged therapy, examine patients for change in color perception, visual fields and fundi. Also reported have been: blood dyscrasias including thrombocytopenia with purpura, agranulocytosis and aplastic anemia; elevations of BUN, serum uric acid, or blood sugar. Symptomatic gout may be induced. In surgical patients thiazides may reduce response to vasopressors and increase response to tubocurarine.

Adverse Reactions: Pargyline may be associated with orthostatic hypotension. Mild constipation, slight edema, dry mouth, sweating, increased appetite, arthralgia, nausea and vomiting, headache, insomnia, difficulty in micturition, nightmares, impotence, delayed ejaculation, rash, and purpura have been encountered with pargyline. Hyperexcitability, increased neuromuscular activity (muscle twitching) and other extrapyramidal symptoms have been reported in a few patients with reduced cardiac reserve.

During intensive or prolonged therapy, guard against hypochloremic alkalosis and hypokalemia (especially the latter if patient is on digitalis). Observe all patients for signs of hyponatremia ("low salt" syndrome).

Reported thiazide reactions also include anorexia, nausea, vomiting, diarrhea, headache, dizziness, paresthesia, weakness, skin rash, photosensitivity, jaundice, and pancreatitis. Nocturia has been observed with the combination.

801438

ABBOTT

TM-TRADEMARK

This pain is getting on my nerves.

Patients in pain often experience concomitant anxiety and tension, which may add to the burden of pain.

For such patients, you may want to prescribe a preparation that offers more than simple analgesia.

A good choice is often EQUAGESIC® (meprobamate and ethoheptazine citrate with aspirin). It helps relieve pain. And anxiety. And skeletal muscle spasm as related to pain or anxiety and tension.

Equagesic® TABLETS

(meprobamate and ethoheptazine citrate with aspirin)

Wyeth®

Contraindications: History of sensitivity or severe intolerance to aspirin or meprobamate.

Warnings: USE IN PREGNANCY: Safety for use during pregnancy or lactation has not been established; therefore it should be used in pregnant patients or women of child-bearing age only when the physician judges its use essential to the patient's welfare.

Precautions: Keep out of reach of children. Not recommended for patients 12 years old or less. Carefully supervise dose and amounts prescribed, especially for patients prone to overdose themselves. Excessive prolonged use of meprobamate may result in dependence or habituation in susceptible persons—as alcoholics, ex-addicts, severe psychoneurotics. Withdraw gradually after prolonged high dosage to avoid possibly severe withdrawal reactions including epileptiform seizures. Warn patients of possible reduced alcohol tolerance. If drowsiness, ataxia or visual disturbances (impairment of accommodation and visual acuity) occur, reduce dose. If symptoms persist, caution patients against operating machinery or driving. After meprobamate overdose, prompt sleep, reduction of blood pressure, pulse and respiratory rates to basal levels, and hyperventilation are reported. Give cautiously to patients with suicidal tendencies. Treat attempted suicide (has resulted in coma, shock, vasomotor and respiratory collapse and anuria) with immediate gastric lavage and appropriate supportive therapy (CNS stimulants and pressor amines as indicated).

Side Effects: Ethoheptazine and aspirin may occasionally cause nausea, vomiting, epigastric distress, and rarely dizziness. Overdosage may result in CNS depression (drowsiness and lightheadedness) or CNS stimulation and salicylate intoxication (requires induced vomiting or gastric lavage, specific parenteral electrolyte therapy for ketoacidosis and dehydration, and observation for hypoprothrombinemic hemorrhage [usually requires whole blood transfusions]). Meprobamate may cause drowsiness, ataxia and rarely allergic or idiosyncratic reactions. These reactions, sometimes severe, can develop in patients receiving only 1 to 4 doses who have had no previous contact with meprobamate. Mild reactions are characterized by urticarial or erythematous maculopapular rash. Acute nonthrombocytopenic purpura with petechiae, ecchymoses, peripheral edema and fever have been reported. If allergic reaction occurs, meprobamate should be stopped and not reinstituted. Severe reactions, observed very rarely, include angioneurotic edema, bronchial spasms, fever, fainting spells, hypotensive crises (1 fatal case), anaphylaxis, stomatitis and proctitis (1 case) and hyperthermia. Treat symptomatically such as with epinephrine, antihistamine and possibly hydrocortisone. A few cases of leucopenia, usually transient, have been reported following continuous use. Rarely, cases of aplastic anemia (1 fatal case), thrombocytopenic purpura, agranulocytosis, and hemolytic anemia have been reported; almost always, in the presence of known toxic agents.

Composition: 150 mg. meprobamate, 75 mg. ethoheptazine citrate and 250 mg. aspirin per tablet.

Wyeth Laboratories Philadelphia, Pa.

A MESSAGE FROM THE IMMEDIATE PAST PRESIDENT OF THE BAMA

It has been a pleasure to have served as President of the Baltimore Association of Medical Assistants. The leadership is now in the capable hands of Eleanor Mainhart, CMA.

Being a charter member of the MAMA, there were many dreams for the BAMA and some of these have materialized. We have attained our goal of formal weekly educational classes and all of our meetings have been in keeping with the AAMA's concern over the 3 R's—RESEARCH —REFRESHERS—RETRAINING. We are also working on community service projects.

No President could accomplish any venture without good officers, committee chairmen and advisors. The loyalty, support and untiring effort on the part of the above have made the role of President very enjoyable, and for which I am deeply grateful. My sincere gratitude is also to the many physicians who have given so freely of their valuable time to speak at our monthly meetings.

The challenge of the role of the medical assistant in the field of medicine is increasingly mounting and the BAMA has accepted this challenge. My sincere hope is for continued growth and all the blessings and good wishes to the new officers.

DOCTORS, NURSES MEETING SET FOR WILLIAMSBURG, MARCH 11-13, 1968

The 14th annual combined Sectional Meeting for doctors and nurses sponsored by the American College of Surgeons will be held in Williamsburg, Va., March 11-13, 1968.

The first combined scientific program was presented in 1955 in Cleveland to provide a forum for the interchange of ideas and to help each group to keep abreast of technological and scientific advances. The meetings are similar in format and scope to the College's annual Clinical Congress.

The doctors' segment of the program will include presentations in general surgery and the following specialties: Gynecology - Obstetrics, Neurosurgery, Cardiovascular Surgery, Otorhinolaryngology, and Orthopedic Surgery.

Nurses discussions will focus on Patient Communications, Cryosurgery, Open-Heart Surgery, Clinical Specialists, Surgical Technicians, and other technical specialized procedures.

Medical films will be included in both programs.

David M. Hume, MD, Richmond, Va., is chairman of the surgeons' committee preparing the program for doctors. Mrs. Ina Love Williams, RN, Portsmouth, Va., heads the nurses' program committee.

Nurses and Fellows of the College may register at no charge. Other doctors will be assessed a registration fee of $15.00.

Program details and official hotel reservations forms may be obtained from College headquarters. Requests should be sent to: Mr. T. E. McGinnis, American College of Surgeons, 55 East Erie Street, Chicago, Illinois, 60611.

GENERAL SESSIONS
(Doctors Preliminary Program)

Monday, March 11

9-12 Noon	Presiding: Reed M. Nesbit, Ann Arbor, President, A.C.S.
9-9:30 A.M.	Motion Pictures.
9:30-10:45 A.M.	Panel: CLINICAL RENAL TRANSPLANTATION. Moderator: David M. Hume, Richmond. Panel: J. Hartwell Harrison, Boston. G. Melville Williams, Richmond. Leslie Rudolf, Charlottesville.
11-12 Noon	Papers. HEART TRANSPLANTATION. Richard R. Lower, Richmond. LIVER PERFUSION AND TRANSPLANTATION. William McDermott, Jr. REPLANTATION OF EXTREMITIES. Ronald A. Malt, Boston.
1:30-5 P.M.	Presiding: Charles J. Devine, Jr., Norfolk.
1:30-2 P.M.	Motion Picture.
2-3:30 P.M.	Panel: SURGICAL PROBLEMS OF PELVIC CANCER. Moderator: Irving F. Enquist, Brooklyn. Panel: George R. Prout, Jr., Richmond. William N. Thornton, Jr., Charlottesville. Edgar Boling, Atlanta.

3:45-5 P.M.	Papers. THE CLINICAL SIGNIFICANCE OF LOBULAR CARCINOMA INSITU OF THE BREAST. Edward F. Lewison, Baltimore. SELECTION OF PATIENTS IN SURGICAL TREATMENT OF NODULAR GOITER AND THYROID DISEASE. Colin G. Thomas, Jr., Chapel Hill. RECONSTRUCTION AFTER HEAD AND NECK CANCER SURGERY. Kenneth L. Pickrell, Durham.
Tuesday, March 12	
9-12 Noon	Presiding: William Allen Johns, Richmond.
9:30-11 A.M.	Panel: MANAGEMENT OF POSTGASTRECTOMY PROBLEMS Moderator: Walter Lawrence, Jr., Richmond. Panel: Edward R. Woodward, Gainesville. Theodore Drapanas, Pittsburgh. H. William Scott, Jr., Nashville.
11:15-12:30 P.M.	Papers. THE DIFFERENTIATION OF REGIONAL ILEOCOLITIS FROM MUCOSAL ULCERATIVE COLITIS. Rupert B. Turnbull, Jr., Cleveland. EXPERIENCE WITH THE THIERSCH WIRE IN RECTAL PROLAPSE. Robert V. Terrell, Richmond. THE ROLE OF CHOLANGIOGRAPHY IN THE MANAGEMENT OF COMMON DUCT OBSTRUCTION. Thomas N. P. Johns, Richmond.
1:30-5 P.M.	Presiding: William R. Sandusky, Charlottesville.
1:30-2 P.M.	Motion Picture.
2-3:30 P.M.	Panel: MANAGEMENT OF MULTIPLE ORGAN INJURIES Moderator: Curtis P. Artz, Charleston. Panel: G. Tom Shires, Dallas. Eugene F. Poutasse, Norfolk. Justus C. Pickett, Morgantown. James W. Brooks, Richmond.
3:45-5 P.M.	Papers. BURNS. Boyd W. Haynes, Jr., Richmond. TENDON REPAIR. Earle E. Peacock, Jr., Chapel Hill. CRYOTHERAPY IN OPHTHALMIC SURGERY. Herbert Wiesinger, Richmond.
Wednesday, March 13	
8:30-12 Noon	Presiding: Jacquelin M. Harrison, Richmond.
8:30-9 A.M.	Motion Picture.
9-10:30 A.M.	Panel: IMMEDIATE POSTOPERATIVE PROBLEMS Moderator: James D. Hardy, Jackson. Panel: Thomas F. Nealon, Philadelphia. (Pulmonary) (Anesthesia & Monitoring) Henry Thomas Randall, New York. (Fluid & Electrolytes) John Y. Templeton, III, Rosemont, Pa. (Cardio Vascular)
10:45-12 Noon	Papers. SEPTIC SHOCK. THROMBOEMBOLISM. David C. Sabiston, Jr., Durham. SURGICAL BLEEDING. Alexander W. Ulin, Philadelphia.

NEUROSURGERY

Monday, March 11

9-12 Noon — Presiding: William F. Meacham, Nashville.

9-9:30 A.M. — Motion Picture.

9:30-11 A.M. — Panel: CRANIOFACIAL RESECTION OF MALIGNANT TUMORS OF UPPER FACE, PARANASAL SINUSES AND EAR
Moderator: William F. Collins, Jr., Richmond.
Panel: J. M. Van Buren, Bethesda.
Jose J. Terz, Richmond.
Milton T. Edgerton, Jr., Baltimore.

11:10-12 Noon — Papers.
MID-BRAIN STEREOTACTIC LESIONS FOR RELIEF OF FACE, NECK AND ARM PAIN. Blain S. Nashold, Jr., Durham.
TRANSCRANIAL FRONTAL APPROACH TO THE ORBIT. Edgar M. Housepian, New York.

1:30-5 P.M. — Presiding: Guy L. Odom, Durham.

1:30-2 P.M. — Motion Picture.

2-3:30 P.M. — Panel: SURGERY OF THE PITUITARY GLAND
Moderator: Bronson S. Ray, New York.
Panel: Louis W. Conway, Richmond. (Results of Stereotactic Pituitary Surgery for Acromegaly)
Charles A. Fager, Boston. (Pituitary Surgery for Diabetes)
Bronson S. Ray, New York. (Transcranial Surgery of the Pituitary)

3:45-5 P.M. — Papers.
LOCAL HYPOTHERMIA FOR THERAPY OF ACUTE SPINAL CORD INJURY. Robert J. White, Cleveland.
SUBARACHNOID RISA AS A DIAGNOSTIC AID IN NEUROSURGERY. Maitland Baldwin, Bethesda.
EVALUATION OF TREATMENT OF GLIOBLASTOMA MULTIFORME. Richard K. Jelsma, Chicago.

CARDIOVASCULAR SURGERY

Monday, March 11

1:30-5 P.M. — Presiding: William H. Muller, Jr., Charlottesville.

1:30-2 P.M. — Motion Picture.

2-3:15 P.M. — Panel: SURGERY OF CORONARY ARTERY DISEASE.
Moderator: John H. Gibbon, Jr., Philadelphia.
Panel: William H. Sewell, Sayre. (Choice of Operation)
Julian Johnson, Philadelphia. (Internal Mammary Artery Implantation: Technique and Indications)
James H. Walker, Charleston. (Results of Internal Mammary Artery Implantation)

3:30-5 P.M. — Symposium: SURGERY FOR VALVULAR HEART DISEASE.
Moderator: Henry T. Bahnson, Pittsburgh.
Participants: John W. Kirklin, Birmingham. (Aortic Valve Homogra)
Frank C. Spencer, New York. (Prosthetic Replacement for Aortic Valve Disease)
Andrew Glenn Morrow, Bethesda. (Mitral Valve Replacement)
Charles A. Hufnagel, Washington. (Indications for Closed Operations or Plastic Repair of the Diseased Aortic and Mitral Valve)

OTORHINOLARYNGOLOGY

Tuesday, March 12

9:30-12:30 P.M. Presiding: Peter N. Pastore, Richmond.

9:30-10:30 A.M. How-I-Do-It-Clinic—IMPLANTS AS AN AID IN THE CORRECTION OF TRAUMA OR MALFUNCTION OF THE EAR, NOSE AND THROAT STRUCTURES.
Moderator: John E. Bordley, Baltimore.
Participants: John T. Dickinson, Pittsburgh. (Nasal-Sinus-Facial Complex)
Paul Ward, Nashville. (Velo-Palatine Dysfunction)
Godfrey Arnold, Jackson. (Laryngeal Malfunction)

10:30-10:45 A.M. Paper.
LARYNGEAL TRANSPLANTS—CURRENT STATUS. Joseph H. Ogura, St. Louis.

11-11:45 A.M. Panel: PROGRESS IN SURGICAL PROCEDURES FOR THE CONTROL OF PERSISTENT HEMORRHAGE—NOSE-LARYNX-TRACHEA.
Moderator: Francis H. McGovern, Danville.
Panel: Edwin N. Rise, Memphis.
James R. Chandler, Jr., Miami.
W. Franklin Keim, Montclair.

11:45-12:30 P.M. Papers.
CONTROL OF CHRONIC PAROTID SALIVARY GLAND DISEASE: THE MIDDLE EAR APPROACH. White M. Wallenborn, Charlottesville.
REPORT ON ALIMENTATION BY CERVICAL ESOPHAGOSTOMY. G. Slaughter FitzHugh, Charlottesville.

1:30-5 P.M. Presiding: Gordon D. Hoople, Syracuse.

1:30-2 P.M. Motion Picture.

2-3:15 P.M. Panel: MENIERE'S DISEASE—TRENDS AND SURGICAL TREATMENT.
Moderator: Gordon D. Hoople, Syracuse.
Panel: Raymond E. Jordon, Pittsburgh. (Thermocautery)
G. Douglas Hayden, Richmond. (Ultrasound)
Robert J. Wolfson, Philadelphia. (Cryotherapy)

3:30-4:45 P.M. Panel: REHABILITATION AFTER TOTAL LARYNGECTOMY.
Moderator: Joseph L. Goldman, New York.
Panel: Alden H. Miller, Los Angeles.
William W. Montgomery, Boston.
Douglas P. Bryce, Toronto.

4:45-5 P.M. Paper.
ELECTRONIC MECHANICAL AIDS FOR LARYNGECTOMY. Ann F. Flowers, Richmond.

CHARLES ST. AT MT. VERNON PLACE

The Science of Communication as practiced at Monumental Printing

It's more than a science: it's an Art, the precise transliteration in print of an intangible idea for a heterogeneous group of critical readers.

Here, at Monumental Printing, we learned to handle the tools of intelligent communication by the empirical method: working with them. The brush and palette of our art, the chisel, the score, the script are simply words on paper. We learned their proper use over 50 years of practice by being permitted to print such Journals as:

Clinical Chemistry
Digestive Diseases
Fertility & Sterility
Occupational Medicine
Leprosy
Mental Hospitals
Psychiatric Studies and Projects
Psychosomatic Medicine

We speak *your* language. We know the difference between edema and enema; syndrome and symptom; sewage and sewerage. And when and why we should use 12 point Caslon Bold instead of 10 Stymie.

If you, too, need a *good* printer, let's communicate!

Monumental Printing Co.

3110 Elm Avenue **Baltimore, Md. 21211**

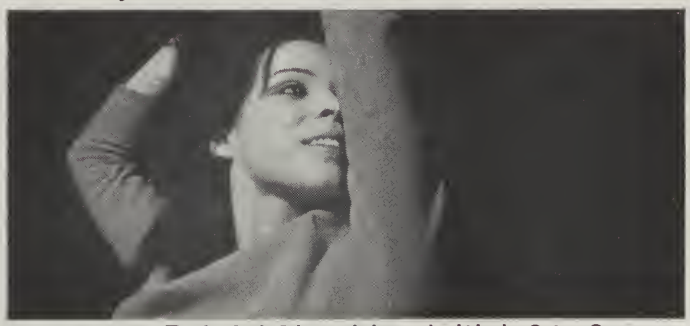
Washington and New York offices, also

Help can be weeks away for a painful shoulder.

Except with Butazolidin® alka.

If it doesn't work in a week, forget it.



: don't forget this about Butazolidin alka

ntraindications: Edema; danger of cardiac ompensation; history or symptoms of pep- ulcer; renal, hepatic or cardiac damage; ory of drug allergy; history of blood dys- sia. The drug should not be given when the aent is senile or when other potent drugs are n concurrently. Large doses of Butazolidin are contraindicated in glaucoma.

rning: If coumarin-type anticoagulants are n simultaneously, watch for excessive in- ase in prothrombin time. Instances of ere bleeding have occurred. Pyrazole com- nds may potentiate the pharmacologic on of sulfonylurea, sulfonamide-type nts and insulin. Carefully observe patients iving such therapy. Use with great caution e first trimester of pregnancy.

cautions: Before prescribing, carefully lct patients, avoiding those responsive to ine measures as well as contraindicated ents. Obtain a detailed history and a com- e physical and laboratory examination, in- ing a blood count. The patient should not eed recommended dosage, should be ely supervised and should be warned to ntinue the drug and report immediately if , sore throat, or mouth lesions (symptoms lood dyscrasia); sudden weight gain (water tion); skin reactions; black or tarry stools ther evidence of intestinal hemorrhage r. Make regular blood counts. Discontinue drug immediately and institute counter- sures if the white count changes signifi- y, granulocytes decrease, or immature s appear. Use greater care in the elderly n hypertensives.

dverse Reactions: The most common are ea, edema and drug rash. Swelling of the s or face may be minimized by withhold- ietary salt, reduction in dosage or use of tics. In elderly patients and in those with rtension the drug should be discontinued the appearance of edema. The drug has associated with peptic ulcer and may re- ate a latent peptic ulcer. The patient should be instructed to take doses immediately before or after meals or with milk to minimize gastric upset. Mild drug rashes frequently subside with reduction of dosage. However, rash accompanied by fever or other systemic reactions usually requires withholding medication. Purpuric rash has also been reported. Agranulocytosis, exfoliative dermatitis, Stevens-Johnson syndrome, or a generalized allergic reaction similar to serum sickness may occur and require permanent withdrawal of medication. Stomatitis, salivary gland enlargement, vomiting, vertigo and languor may occur. Leukemia and leukemoid reactions have been reported. While not definitely attributable to the drug, a causal relationship cannot be excluded. Thrombocytopenic purpura and aplastic anemia may occur. Confusional states, agitation, headache, blurred vision, optic neuritis and transient hearing loss have been reported, as have hyperglycemia, hepatitis, jaundice, and several cases of anuria and hematuria. With long-term use, reversible thyroid hyperplasia may occur infrequently. Moderate lowering of the red cell count due to hemodilution may occur.

Dosage in Painful Shoulder: Initial: 3 to 6 capsules daily in 3 or 4 equal doses. Trial period: one week. Maintenance dosage should not exceed 4 capsules daily; response is often achieved with 1 or 2 capsules daily. 6509-v(8)82

Butazolidin® alka Geigy

Capsules

phenylbutazone, 100 mg.; dried aluminum hydroxide gel, 100 mg.; magnesium trisilicate, 150 mg.; homatropine methylbromide, 1.25 mg.

Ardsley, New York 10502

BU 5462

Tissue's healing nicely. Yet anxiety slows his steps toward recovery.

By helping overcome anxiety and tension which can thwart the convalescent's progress, Equanil® often may play an important role in medical and surgical aftercare.

Indications: For use in management of anxiety and tension occurring alone or as accompanying symptom complex to medical and surgical disorders and procedures. Though not a hypnotic, fosters normal sleep through antianxiety and related muscle-relaxant properties.

Contraindications: History of sensitivity to meprobamate.

Important Precautions: Carefully supervise dose and amounts prescribed, especially for patients prone to overdose themselves. Excessive prolonged use has been reported to result in dependence or habituation in susceptible persons, as alcoholics, ex-addicts, and other severe psychoneurotics. After prolonged excessive dosage, reduce dosage gradually to avoid possibly severe withdrawal reactions. Abrupt discontinuance of excessive doses has sometimes resulted in epileptiform seizures.

Warn patients of possible reduced alcohol tolerance, with resultant slowing of reaction time and impairment of judgment and coordination.

Reduce dose if drowsiness, ataxia or visual disturbance occurs; if persistent, patients should not operate vehicles or dangerous machinery.

Side Effects include drowsiness, usually transient; if persistent and associated with ataxia, usually responds to dose reduction; occasionally concomitant CNS stimulants (amphetamine, mephentermine sulfate) are desirable. Allergic or idiosyncratic reactions are rare, but such reactions, sometimes severe, can develop in patients receiving only 1 to 4 doses who have had no previous contact with meprobamate. Previous history of allergy may or may not be related to incidence of reactions. Mild reactions are characterized by itchy urticarial or erythematous maculopapular rash, generalized or confined to groin. Acute nonthrombocytopenic purpura with cutaneous petechiae, ecchymoses, peripheral edema and fever have been reported.

One fatal case of bullous dermatitis following intermittent use of meprobamate with prednisolone has been reported. If allergic reaction occurs, meprobamate should be stopped and not reinstituted. Severe reactions, observed very rarely, include angioneurotic edema, bronchial spasms, fever, fainting spells, hypotensive crises (1 fatal case), anaphylaxis, stomatitis and proctitis (1 case) and hyperthermia. Treat symptomatically as with epinephrine, antihistamine and possibly hydrocortisone. Aplastic anemia (1 fatal case), thrombocytopenic purpura, agranulocytosis and hemolytic anemia have occurred rarely, almost always in presence of known toxic agents. A few cases of leukopenia, usually transient, have been reported on continuous administration.

Meprobamate may sometimes precipitate grand mal attacks in patients susceptible to both grand and petit mal. Extremely large doses can produce rhythmic fast activity in the cortical pattern. Impairment of accommodation and visual acuity has been reported rarely. After excessive dosage for weeks or months, withdraw gradually (1 or 2 weeks) to avoid recurrence of pretreatment symptoms (insomnia, severe anxiety, anorexia). Abrupt discontinuance of excessive doses has sometimes resulted in vomiting, ataxia, tremors, muscle twitching and epileptiform seizures. Prescribe very cautiously and in small amounts for patients with suicidal tendencies. Suicidal attempts have resulted in coma, shock, vasomotor and respiratory collapse and anuria. Excessive doses have resulted in prompt sleep; reduction of blood pressure, pulse and respiratory rates to basal levels; and occasionally hyperventilation. Treat with immediate gastric lavage and appropriate symptomatic therapy. (CNS stimulants and pressor amines as indicated.) Doses above 2400 mg./day are not recommended.

Composition: Tablets, 200 mg. and 400 mg. meprobamate. Coated Tablets, WYSEALS® EQUANIL (meprobamate) 400 mg. (All tablets also available in REDIPAK® [strip pack], Wyeth.) Continuous-Release Capsules, EQUANIL L-A (meprobamate) 400 mg.

Wyeth Laboratories Philadelphia, Pa.

Wyeth® SERVICE TO MEDICINE

Equanil®

(meprobamate)

Wyeth

Professionally posed.

Tandearil®, oxyphenbutazone, 100 mg. tablets

Indications: Osteoarthritis, rheumatoid arthritis, rheumatoid spondylitis, psoriatic arthritis, gout, painful shoulder (peritendinitis, capsulitis, bursitis and acute arthritis of that joint), acute superficial thrombophlebitis, severe forms of a variety of local inflammatory conditions. (In inflammatory conditions not involving prolonged or fatal disease, use only when severity of condition balances potential toxicity.)
The drug has no significant uricosuric action but is of value only in the treatment of acute gouty arthritis.
Contraindications: Edema; danger of cardiac decompensation; history or symptoms of peptic ulcer; renal, hepatic or cardiac damage; history of drug allergy; history of blood dyscrasia. The drug should not be given when the patient is senile or when other potent drugs are given concurrently.
Warning: Tandearil is an analog of phenylbutazone; sensitive patients may be cross-reactive. If coumarin-type anticoagulants are given simultaneously, watch for excessive increase in prothrombin time. Instances of severe bleeding have occurred. Pyrazole compounds may potentiate the pharmacologic action of sulfonylurea, sulfonamide-type agents and insulin. Carefully observe patients receiving such therapy. Use with great caution in the first trimester of pregnancy.
Precautions: Before prescribing, carefully select patients, avoiding those responsive to routine measures as well as contraindicated patients. Obtain a detailed history and a complete physical and laboratory examination, including a blood count. The patient should not exceed recommended dosage, should be closely supervised and should be warned to discontinue the drug and report immediately fever, sore throat, or mouth lesions (symptoms of blood dyscrasia); sudden weight gain (water retention); skin reactions; black or tarry stools or other evidence of intestinal hemorrhage occur. Make regular blood counts. Discontinue the drug immediately and institute countermeasures if the white count changes significantly, granulocytes decrease, or immature forms appear. Use greater care in the elderly and in hypertensives.
Adverse Reactions: The most common are nausea, edema and drug rash. Swelling of the ankles or face may be minimized by with-

"Pain Break" for an osteoarthritic. Tandearil can ease it.

At 46, her knees still look good on the outside. But inside, there may be the familiar picture of osteoarthritis.

If aspirin doesn't help, Tandearil often will. Pain and stiffness begin to ease up in 3 or 4 days. You can often maintain response with a daily dose of only 1 or 2 tablets.

Of course, Tandearil is not for every osteoarthritic. Select your patients carefully and follow them in line with the Contraindications, Precautions, Warning, and Adverse Reactions listed below.

But for many aspirin-stubborn osteoarthritics, let Tandearil ease the unwelcome pain breaks of osteoarthritis.

Tandearil®
oxyphenbutazone

olding dietary salt, reduction in dosage or use f diuretics. In elderly patients and in those ith hypertension the drug should be discon- nued with the appearance of edema. The rug has been associated with peptic ulcer nd may reactivate a latent peptic ulcer. The atient should be instructed to take doses im- ediately after meals or with milk to minimize astric upset. Mild drug rashes frequently ubside with reduction of dosage. However, sh accompanied by fever or other systemic actions usually requires withholding medica- on. Purpuric rash has also been reported. granulocytosis or a generalized allergic reac- on similar to a serum sickness syndrome may cur and require permanent withdrawal of edication. Stomatitis, salivary gland enlarge- ent, vomiting, vertigo and languor may occur. Leukemia and leukemoid reactions have been reported. While not definitely attributable to the drug, a causal relationship cannot be excluded. Thrombocytopenic purpura and aplastic anemia may occur. Confusional states, agitation, headache, blurred vision, optic neuritis and transient hearing loss have been reported, as have hyperglycemia, hepatitis, jaundice, and several cases of anuria and hematuria. With long-term use, reversible thyroid hyperplasia may occur infrequently. Moderate lowering of the red cell count due to hemodilution may occur.

Dosage in Osteoarthritis: Initial: 3 to 6 tablets daily in divided doses. It is usually unnecessary to exceed 4 tablets daily. A trial period of 1 week is adequate to determine response; in the absence of a favorable response, discontinue. Maintenance: An effective level is often achieved with 1 or 2 tablets daily, do not exceed 4 daily. 6562-VI(B)R2

NOTICES OF GENERAL INTEREST

Occupational Health:

The Occupational Health Committee, at its meeting of January 17, 1968, considered Council's letter of September 14, 1967 concerning adoption of Liaison Committee's recommendations. The following motion was passed:

> The Occupational Health Committee of the Medical and Chirurgical Faculty of Maryland supports the principle that industry requiring pre-employment chest X-rays should be encouraged to contract with a private Radiologist whenever possible. The Health Department and the Maryland Tuberculosis Association should discourage the use of their facilities by industry for pre-employment X-rays where it is felt that such an arrangement with a private Radiologist is feasible.

* * * *

Massachusetts General Seeks Information:

A committee of the Massachusetts General Hospital is studying the hospital's records and world literature to determine pertinent features in all patients who, *despite coma for over five weeks,* have made a useful recovery.

The committee feels that it is vital not to overlook any well-documented patient in this category and would appreciate being informed of any case published under a title which is not indicative of survival after prolonged coma, as well as accounts of such cases as yet unreported, for incorporation in a publication.

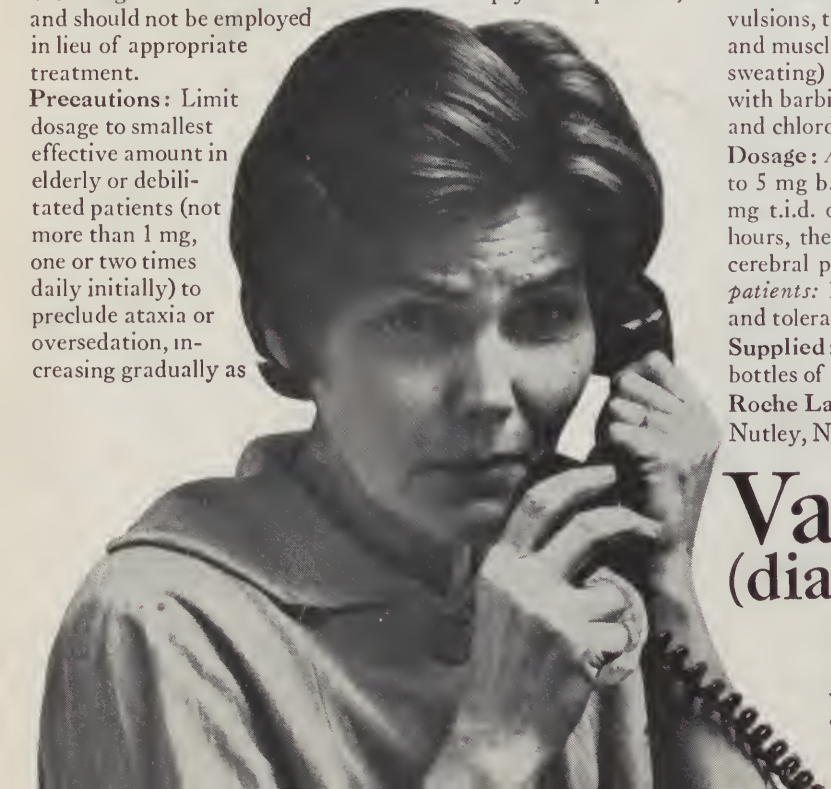
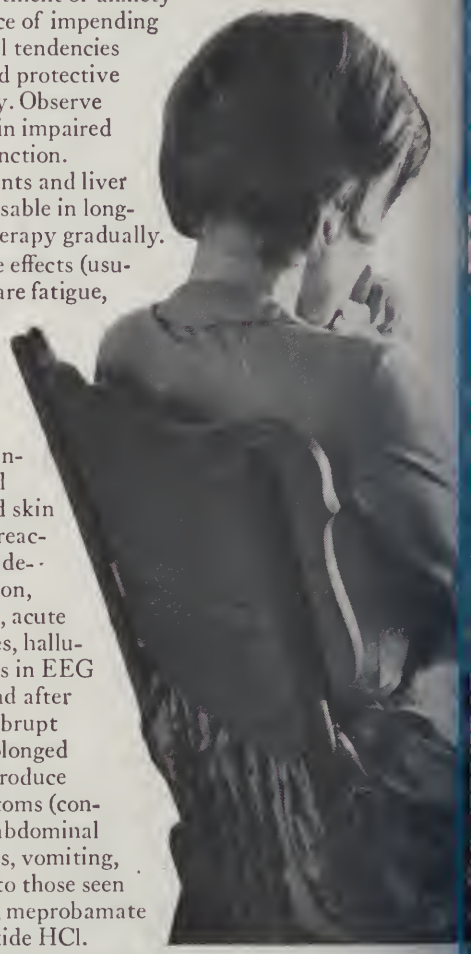
Tears without grief

Crying Spells–psychic tension with depressive symptoms?
"I don't know what's the matter with me lately...I cry and I cry... and I really don't know why I do."

A woman often is not conscious of the real reasons for her crying spells or refuses to admit them to herself. On probing, you may find that frequent weeping, like insomnia or neurotic fatigue, often is an expression of psychic tension. She needs sympathy and reassurance, and perhaps a calming agent to help her over her crisis. Consider prescribing Valium (diazepam) for her. It usually reestablishes calmness promptly. Crying spells and other secondary depressive symptoms normally subside as the tension is relieved. Your patient then can cope more easily with stresses to which she is subjected. Valium (diazepam) is generally well tolerated, and on proper maintenance dosage usually does not impair mental acuity or ability to function. If side effects such as ataxia and drowsiness occur, they usually disappear with dosage adjustment.





Before prescribing, please consult complete product information, a summary of which follows:

Contraindications: Infants, patients with history of convulsive disorders, glaucoma or known hypersensitivity to drug.

Warning: Not of value in the treatment of psychotic patients, and should not be employed in lieu of appropriate treatment.

Precautions: Limit dosage to smallest effective amount in elderly or debilitated patients (not more than 1 mg, one or two times daily initially) to preclude ataxia or oversedation, increasing gradually as needed or tolerated. As is true of all CNS-acting drugs, until correct maintenance dosage is established, advise patients against possibly hazardous procedures requiring complete mental alertness or physical coordination. Driving during therapy not recommended. In general, concurrent use with other psychotropic agents is not recommended. If such combination therapy is used, carefully consider individual pharmacologic effects–particularly with known compounds which may potentiate action of Valium (diazepam), such as phenothiazines, barbiturates, MAO inhibitors and other antidepressants. Advise patients against simultaneous ingestion of alcohol or other CNS depressants. Safe use in pregnancy not established. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Observe usual precautions in impaired renal or hepatic function. Periodic blood counts and liver function tests advisable in long-term use. Cease therapy gradually.

Side Effects: Side effects (usually dose-related) are fatigue, drowsiness and ataxia. Also reported: mild nausea, dizziness, blurred vision, diplopia, headache, incontinence, slurred speech, tremor and skin rash; paradoxical reactions (excitement, depression, stimulation, sleep disturbances, acute hyperexcited states, hallucinations); changes in EEG patterns during and after drug treatment. Abrupt cessation after prolonged overdosage may produce withdrawal symptoms (convulsions, tremor, abdominal and muscle cramps, vomiting, sweating) similar to those seen with barbiturates, meprobamate and chlordiazepoxide HCl.

Dosage: *Adults:* Mild to moderate psychoneurotic reactions, 2 to 5 mg b.i.d. or t.i.d.; severe psychoneurotic reactions, 5 to 10 mg t.i.d. or q.i.d.; alcoholism, 10 mg t.i.d. or q.i.d. in first 24 hours, then 5 mg t.i.d. or q.i.d. as needed; muscle spasm with cerebral palsy or athetosis, 2 to 10 mg t.i.d. or q.i.d. *Geriatric patients:* 1 or 2 mg/day initially, increase gradually as needed and tolerated. (See Precautions.)

Supplied: Valium® (diazepam) Tablets, 2 mg, 5 mg and 10 mg; bottles of 50 and 500.

b.i.d.

The sensible schedule that covers the patient day and night

If your objective in the use of a broad-spectrum antibiotic is prolonged action, with high blood levels, then you know why b.i.d. DECLOMYCIN is considered to be a sensible dosage schedule.

The maintenance dosage of DECLOMYCIN can be kept at this convenient schedule because of its unusually high effective blood and tissue levels.

The b.i.d. dosage of DECLOMYCIN gives you the comfortable assurance that the patient is well-covered, *day and night.*

In clinical practice, blood levels produced by a therapeutic dose of DECLOMYCIN are high, prolonged, and effective; because of high serum binding and slow renal clearance. And if there's a broader susceptibility pattern of organisms, we've yet to see it.

There is no nced to give higher daily dosage than 300 mg b.i.d., except in venereal discases and Eaton Agent pneumonia.

DECLOMYCIN®
DEMETHYLCHLORTETRACYCLINE

Lederle

Prescribing information on next page.

b.i.d. The sensible schedule that covers the patient day and night

DECLOMYCIN Demethylchlortetracycline should be equally or more effective therapeutically than other tetracyclines when the offending organisms are tetracycline-sensitive.

Contraindication: History of hypersensitivity to demethylchlortetracycline.

Warning—In renal impairment, usual doses may lead to excessive accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated, and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort. Necessary subsequent courses of treatment with tetracyclines should be carefully observed.

Precautions—Overgrowth of nonsusceptible organisms may occure. Constant observation is essential. If new infections appear, appropriate measures should be taken. In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment.

Side Effects—Gastrointestinal system—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. Skin—maculopapular and erythematous rashes. A rare case of exfoliative dermatitis has been reported. Photosensitivity; onycholysis and discoloration of the nails (rare). Kidney—rise in BUN, apparently dose related. Transient increase in urinary output, sometimes accompanied by thirst (rare). Hypersensitivity reactions—urticaria, angioneurotic edema, anaphylaxis. Teeth— dental staining (yellow-brown) in children of mothers given this drug during the latter half of pregnancy, and in children given the drug during the neonatal period, infancy and early childhood. Enamel hypoplasia has been seen in a few children. If adverse reaction or idiosyncrasy occurs discontinue medication and institute appropriate therapy.

Average Adult Daily Dosage: 150 mg q.i.d. or 300 mg b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs. foods and some dairy products. Treatment of streptococcal infections should continue for 10 days, even though symptoms have subsided.

In the treatment of syphilis a dosage schedule of a total of 12 to 18 Gm. given in equally divided doses over a period of 10 to 15 days should be followed. Close follow-up observation of the patient is recommended, including appropriate laboratory tests, since demethylchlortetracycline has not had adequate evaluation in all stages of syphilis. Spinal fluid examination should be included as part of this follow-up.

Acute gonococcal anterior urethritis in males has been treated effectively with a single dose of 600-900 mg. of DECLOMYCIN Demethylchlortetracycline. Individuals unable to tolerate large single doses due to gastrointestinal side effects may be treated with 150 mg. every 6 hours for a minimum of 4 doses or 300 mg. every 12 hours for a minimum of 2 doses. Females should be treated with a dosage of 150 mg. every 6 hours or 300 mg. every 12 hours until a cure is effected.

Primary Atypical Pneumonia (Eaton Agent): The average adult daily dosage is 900 mg. in 3 divided doses for six days.

"Yes, Doctor, the pain is gone."

MPIRIN'® COMPOUND with CODEINE PHOSPHATE gr. 1/2 No. 3

Each tablet contains: Codeine Phosphate gr. ½ (Warning – May be habit forming), Phenacetin gr. 2½, Aspirin gr. 3½, Caffeine gr. ½.

■ Despite introduction of synthetic substitutes, efficacy of 'Empirin' Compound with Codeine remains unchallenged.

BURROUGHS WELLCOME & CO. (U.S.A.) INC., Tuckahoe, N.Y.

An uncommon steroid for common inflammatory dermatoses

In everyday topical steroid therapy, Synalar produces rapid resolution of inflammation and itching in steroid-responsive dermatoses—and at relatively low cost to the patient.

Advanced molecular design enhances potency

Synalar combines the advantage of earlier corticosteroid compounds with unique structural innovations. As a result, preparations of Synalar 0.01% and Synalar 0.025% have been reported to be more potent topically and significantly more effective than hydrocortisone 1.0%. The unique fluocinolone acetonide molecule provides one of the most useful topical corticosteroids for everyday practice.

Impressive clinical results in a wide range of dermatologic problems

The clinical efficacy of Synalar has been extensively documented in the world literature. Commonly encountered diseases such as allergic and contact dermatitis, eczematous and seborrheic dermatitis, and neurodermatitis respond rapidly to Synalar, often where previous therapy with other topical corticosteroids has failed.

Low patient cost for wider usefulness

With Synalar, a high degree of efficacy does not mean high price. And—a small quantity goes a long way. Thus, your patients can often obtain the "economy" of a hydrocortisone preparation with the proved efficacy of a potent, truly advanced steroid.

Synalar®
fluocinolone acetonide

Turn page for contraindications, precautions and side effects.

For everyday topical steroid therapy

Synalar® 0.01%

fluocinolone acetonide provides economy in two practical dosage forms

For general use, the most economical and widely applicable concentration of Synalar is 0.01% Cream in a water-washable, vanishing cream base. Synalar Solution 0.01% is especially valuable in dermatoses involving moist, intertriginous areas or hairy sites where creams and ointments do not spread or penetrate readily. Synalar Solution is a unique dosage form—clear, nongreasy, cosmetically elegant.

Product Information

Contraindications: Tuberculous, fungal, and most viral lesions of the skin (including herpes simplex, vaccinia, and varicella). Not for ophthalmic use. Contraindicated in individuals with a history of hypersensitivity to any of the components. *Precautions:* Synalar preparations are virtually nonsensitizing and nonirritating. However, the solution may produce burning or stinging when applied to denuded or fissured areas. In some patients with dry lesions, the solution may increase dryness, scaling or itching. Where severe local infection or systemic infection exists, the use of systemic antibiotics should be considered, based on susceptibility testing. While topical steroids have not been reported to have an adverse effect on pregnancy, the safety of their use on pregnant females has not absolutely been established. Therefore, they should not be used extensively on pregnant patients, in large amounts, or for prolonged periods of time. *Side Effects:* Side effects are uncommon with topical corticosteroids As with all drugs, however, a few patients may react unfavorably to Synalar under certain conditions. In such cases the agent should be discontinued and appropriate measures taken. *Availability:* Synalar (fluocinolone acetonide) Cream 0.025%—5, 15 and 60 Gm. tubes and 425 Gm. jars. Cream 0.01%—15, 45 and 60 Gm. tubes and 120 Gm. jars. Solution 0.01%—20 and 60 cc. plastic squeeze bottles. Ointment 0.025%—15 and 60 Gm. tubes. Neo-Synalar® (neomycin sulfate 0.5% [0.35% neomycin base], fluocinolone acetonide 0.025%) Cream—5, 15 and 60 Gm. tubes.

SAN FRAN CISCO AMA '68

The excitement of San Francisco's famous sites is waiting for you. Chinatown, the Golden Gate Bridge, Fisherman's Wharf, Telegraph Hill, will add to five memorable and stimulating convention days. Plan to attend now and look forward to an excellent convention in a city of unlimited charm.

Continue your postgraduate education with a varied program of • four General Scientific Meetings on Auto Accidents, Health Care Planning, Infectious Diseases, Treatment of Advanced Malignant Disease • 23 Section Programs • Color Television • Medical Motion Pictures • and over 600 scientific and industrial exhibits. All are designed to bring you up-to-date on what is making medical news today. You will attend lectures by the nation's outstanding medical authorities and discuss with them the significant advances in medicine.

In addition the AMA TV network will present more than 40 hours of convention news.

Reserve now for the Scientific Awards Dinner in honor of the Scientific Award Winners—Wednesday, June 19, 1968. Since space is limited, we suggest you make your reservations before June 3, 1968. Tickets are $10.00 each, payable in advance.

The complete scientific program, plus forms for advance registration and hotel accommodations, will be featured in JAMA, May 6, 1968.

SAN FRANCISCO, CALIFORNIA · JUNE 16-20, 1968

AMERICAN MEDICAL ASSOCIATION'S 117th ANNUAL CONVENTION · BROOKS HALL

Information for Authors

COPYRIGHT. Material that is published in the MARYLAND STATE MEDICAL JOURNAL is protected by copyright and may not be reproduced without the written permission of both the author and the JOURNAL.

MANUSCRIPTS. Manuscripts will be accepted for consideration with the understanding that they are original, have never before been published, and are contributed solely to the MARYLAND STATE MEDICAL JOURNAL. Address manuscripts to Editor, 1211 Cathedral St., Baltimore Maryland 21201.

Rejected manuscripts are returned by regular mail. Accepted manuscripts become the property of the JOURNAL and are not returned. The JOURNAL is not responsible for loss of manuscripts through circumstances that are beyond its control.

Specifications: Manuscripts must be original typed copy (not all capitals), not carbons, on firm typewriter paper, doublespaced throughout (including text, case reports, legends, tables, and references), with margins of at least 1½ inches. Subheads should be inserted at reasonable intervals to break the typographic monotony of lengthy texts. A carbon copy is to be retained by the author. The manuscript should include the title of the article (titles are best brief and concise), the full name of the author (or authors) with degrees, academic or professional titles, affiliations, complete addresses, and any institutional or other credits. Pages should be numbered consecutively. Uncommon and parochial or esoteric abbreviations if used must be explained and the generic as well as the trade names of pharmaceutical products given. Italics are rarely used.

Tables: Each table should be typed on a separate sheet of paper, be numbered consecutively, have a brief descriptive title, and its position in text indicated. Take care that columns add up correctly and that statistics are consistent in both tables and text.

Permissions: When material is reproduced from other sources, full credit must be given to both author and publisher and written permission from these sources included. Where work is reported from a governmental service or institution, clearance by requisite authority should accompany the manuscript.

OPEN LETTER

Dear Doctor:

I am writing to introduce myself as the new Managing Editor of the MARYLAND STATE MEDICAL JOURNAL and to extend my personal invitation to you to participate in the editorial affairs of this journal.

At the moment, I am working toward two futures—the immediate and the not-too distant.

At present, there is an exceptional opportunity for you to have your scientific papers published in the JOURNAL. Our Editor, Dr. Flotte, would be most pleased to receive and consider your manuscripts.

Also, we would appreciate any suggestions you might have as to how we could serve you better. The staff of the JOURNAL feels a genuine obligation to provide a literary platform for you and your fellow physicians engaged in socio-medical, as well as, scientific studies and programs, and to encourage the use of our journal facilities as a spokesman for your efforts in areas of interest to you.

We look forward to hearing from you.

J.S.

EXECUTIVE SECRETARY'S NEWSLETTER

March, 1968

ANNUAL MEETING

Hotel reservations for the Faculty's Annual Meeting should be made at the Sheraton-Belvedere, where a block of 50 rooms has been set aside for Faculty members and their guests.

One of the highlights of the Annual Meeting will be the Presidential Dinner, where Art Buchwald, Syndicated Columnist, will talk on "Son of the Great Society."

Full details of all activities can be found in the Annual Meeting program, which will be in the mail within the next few days.

NEWS NOTES

Robert M. Barnett, M.D., Baltimore, has received board certification in Obstetrics and Gynecology.

Richard E. Hoover, M.D., was honored at a dinner meeting of the Board of Directors, Maryland Society for Prevention of Blindness, recently. He has served on the Board since 1955 and was President since 1959.

At the same meeting, Howard A. Naquin, M.D. was elected President; while John B. Saratsiotis, M.D., was named to the Board. Others serving on the Board include Angus L. McLean, M.D., Arnall Patz, M.D., and Richard D. Richards, M.D.

New Diplomates of the American Board of Anesthesiology include: Roberto S. Garcia, M.D., Oscar Kantt, M.D., and Sylvia Sussman, M.D., of Baltimore; and Theodore W. Striker, M.D. and Sergei L. Snegireff, M.D., of Bethesda.

X-RAY POLICIES

The Faculty's Occupational Health Committee has indicated its support of the policy that industry requiring pre-employment chest x-rays should be encouraged to contract with a private Radiologist, wherever possible.

X-RAY POLICIES (cont'd)

It also stated its endorsement of the policy that Health Department and Maryland Tuberculosis Association facilities should discourage the use of such services for pre-employment x-rays.

AMA PRESIDENT'S COMMENTS

Charles L. Hudson, M.D., while President of the AMA, had some cogent remarks to make regarding the financing of health services.

"It is an area where decisions need to be made - where responsibility needs to be exercised. It is also an area fraught with pitfalls. There are hazards associated with anything we do or what we may fail to do. The hazards of omission, in my estimate, are infinitely greater than the dangers of commission."

PERSONALITIES

Newly named to the Committee on Medicine of The Professional Forum are Henry L. Wollenweber, M.D., Raymond L. Markley, M.D., and Ray Beasley, M.D.

AMA QUESTIONNAIRE

The March 18 issue of AMA News will include a Physician Activity Verification Questionnaire which should be completed and returned to the AMA. Your cooperation is asked in completing and returning this questionnaire.

RETIREMENT PLAN

The Med-Chi Members Retirement Plan has been approved by the Internal Revenue Service. The IRS serial number is PGH: POL:68-26.

Participants in the plan may obtain a written determination as to the qualification of the plan under Section 401 (a) of the IRS Code by filing Form 3673 with their local District Director. The Plan name and serial number as shown above should be indicated on the form.

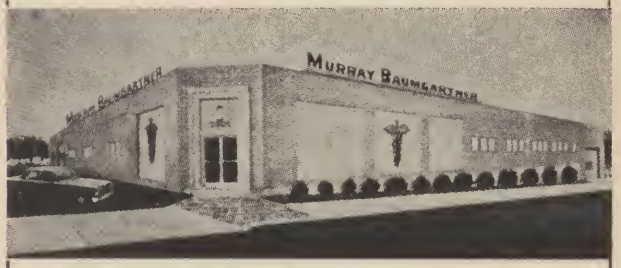
Featherlite
Contour-Shaped
Surgical Two-Way

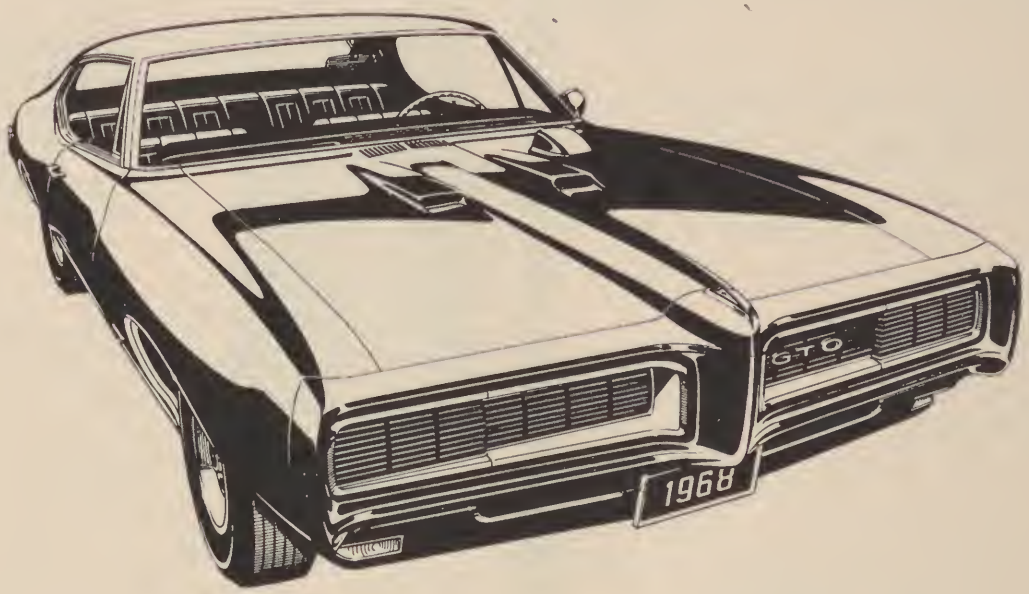


SEAMLESS ELASTIC HOSIERY

Now! . . . a new concept in elastic hosiery achieves excellent cosmetic effect and provides the necessary therapeutic qualities of surgical weight. Using a patented inlay method to insure proper lateral support, fine gauge nylon-covered rubber thread is knitted with MAGILOFT (stretch nylon) yarn to produce a lightweight elastic two-way stretch stocking highly resistant to runs and snags.

For the FIRST time in this field, both STOCK and SPECIALS are available; thus you may offer your patients complete selection of elastic two-way stretch stockings with proper compression, regardless of size or shape.

The Contour-Shape, combined with a MAGILOFT SOFT TOP and knitted-in heel, has eliminated wrinkles at ankle and all tendency to slip down at the top.



The SUPPORT of surgical weight is retained with the advantages of light weight, and all the desirable features of fine gage hosiery.

Don't let monilia cut broad-spectrum therapy short...

start with Tetrex-F®

tetracycline phosphate complex-nystatin

Use of broad-spectrum antibiotics can cause fungal overgrowth in the alimentary tract... and give rise to symptoms so troublesome that therapy must be prematurely stopped. Tetrex-F (tetracycline phosphate complex-nystatin) helps you circumvent this problem.

The nystatin can prevent overgrowth of monilia; the phosphate complex delivers tetracycline to the blood rapidly. Side effects are infrequent.

High-Risk Patients

Tetrex-F (tetracycline phosphate complex-nystatin) is especially useful in patients most susceptible to fungal overgrowth during tetracycline therapy: (1) the elderly or debilitated, (2) young children, (3) the diabetic, (4) those on long-term tetracycline therapy, (5) those on steroid therapy, (6) those who have had moniliasis before, and (7) pregnant patients with a history of monilial vaginitis.

When you start with economical Tetrex-F (tetracycline phosphate complex-nystatin), you can complete the full course of broad-spectrum therapy with less chance of losing control elsewhere. A good start for a healthy finish.

PRESCRIBING INFORMATION. For complete information consult Official Package Circular. *Indications:* Infections of respiratory, gastrointestinal and genitourinary tracts and skin and soft tissues due to tetracycline-sensitive organisms, in patients with increased susceptibility to monilial infections. *Contraindications:* The drug is contraindicated in patients hypersensitive to its components. *Warnings:* Photodynamic reactions have been produced by tetracyclines. Natural and artificial sunlight should be avoided during therapy. Stop treatment if skin discomfort occurs. With renal impairment, systemic accumulation and hepatotoxicity may occur. In this situation, lower doses should be used. Tooth staining and enamel hypoplasia may be induced during tooth development (last trimester of pregnancy, neonatal period and childhood). *Precautions:* Bacterial superinfections may occur. Infants may develop increased intracranial pressure with bulging fontanels. In gonorrheal therapy, serologic tests for syphilis should be conducted initially and monthly for 3 months. *Adverse Reactions:* Glossitis, stomatitis, nausea, diarrhea, flatulence, proctitis, vaginitis, dermatitis, and allergic reactions may occur. *Usual Adult Dosage:* 1 capsule q.i.d. Continue for 10 days in Beta-hemolytic streptococcal infections. Administer one hour before or two hours after meals. *Supplied:* Capsules, bottles of 16 and 100. Each capsule contains tetracycline phosphate complex equivalent to 250 mg. tetracycline HCl activity and 250,000 units of nystatin. For Oral Suspension, 125 mg. tetracycline and 125,000 u. nystatin/5 ml., 60 ml. bottles.

"Upper respiratory infection! I thought everything was a 'virus' these days?"

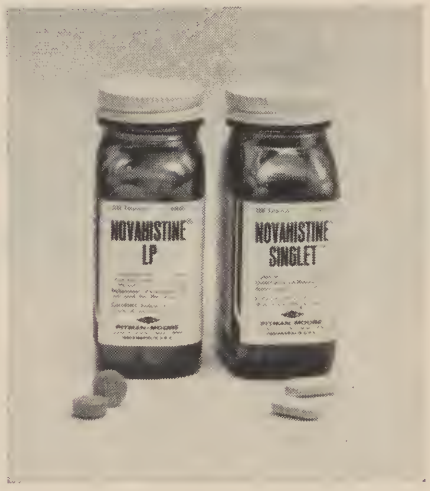
Some U.R.I. patients are more miserable than others.

That's why we make Novahistine® in two different tablet formulations.

And let you control the dosage.

With Novahistine LP tablets and Novahistine Singlet™ tablets you have the range and flexibility of decongestant dosage that lets you prescribe for the needs of the individual patient.

Novahistine LP tablets are most useful for relief of nasal congestion in patients without pain or fever.



Novahistine Singlet tablets, which provide analgesic-antipyretic effect, as well as decongestant action, are indicated for upper respiratory infections accompanied by pain, aches and fever.

Whether you prescribe Novahistine LP or Novahistine Singlet, a total daily dose of 3 or 4 tablets will usually provide effective, continuous relief.

Use cautiously in patients with severe hypertension, diabetes mellitus, hyperthyroidism or urinary retention. Caution ambulatory patients that drowsiness may result.

Each Novahistine LP tablet contains phenylephrine hydrochloride, 25 mg.; and chlorpheniramine maleate, 4 mg.

Each Novahistine Singlet tablet contains phenylephrine hydrochloride, 40 mg.; chlorpheniramine maleate, 8 mg.; and acetaminophen, 500 mg.

Lederle

When the talk turns to oral contraceptives, it makes medical sense to remember low-dose Norinyl®-1.

(norethindrone 1mg. & mestranol 0.05mg.)

Turn page for contraindications, precautions and side effects.

Reduction of oral contraceptive dosage to the lowest effective levels is a well-accepted principle of conservative medical practice. In keeping with this view, Norinyl is now also available as Norinyl-1, containing exactly one half the previous dosage of norethindrone and mestranol. Clinical experience has established that effective fertility control can be achieved with the same degree of reliability and safety with new Norinyl-1 when taken as directed.

What about switching patients from higher dosage forms?

In transferring patients to low-dose Norinyl-1 from higher-dosage oral contraceptives, some breakthrough bleeding may occur in the early cycles. In the majority of cases the bleeding episode is mild and self-limited. The long-term advantages of the lower dosage form should be weighed against the inconvenience of possible breakthrough bleeding in the individual patient.

Contraindications: 1. Patients with thrombophlebitis or with a history of thrombophlebitis or pulmonary embolism. 2. Liver dysfunction or disease. 3. Patients with known or suspected carcinoma of the breast or genital organs. 4. Undiagnosed vaginal bleeding.

Warnings: 1. Discontinue medication pending examination if there is sudden partial or complete loss of vision or if there is a sudden onset of proptosis, diplopia or migraine. If examination reveals papilledema or retinal vascular lesions, medication should be withdrawn. 2. Since the safety of NORINYL-1 (norethindrone 1 mg. with mestranol 0.05 mg.) in pregnancy has not been demonstrated, it is recommended that for any patient who has missed two consecutive periods, pregnancy should be ruled out before continuing the contraceptive regimen. If the patient has not adhered to the prescribed schedule, the possibility of pregnancy should be considered at the time of the first missed period. 3. Detectable amounts of the active ingredients in oral contraceptives have been identified in the milk of mothers receiving these drugs. The significance of this dose to the infant has not been determined.

Precautions: 1. The pretreatment physical examination should include special reference to breast and pelvic organs, as well as a Papanicolaou smear. 2. Endocrine and possibly liver function tests may be affected by treatment with NORINYL-1. Therefore, if such tests are abnormal in a patient taking NORINYL-1 it is recommended that they be repeated after the drug has been withdrawn for two months. 3. Under the influence of estrogen-progestogen preparations, preexisting uterine fibromyomata may increase in size. 4. Because these agents may cause some degree of fluid retention, conditions that may be influenced by this factor, such as epilepsy, migraine, asthma, cardiac or renal dysfunction, require careful observation. 5. NORINYL-1 should be used with caution in patients with a history of cerebrovascular accident. 6. In relation to breakthrough bleeding, and as in all cases of irregular bleeding *per vaginam*, nonfunctional causes should be borne in mind. In cases of undiagnosed vaginal bleeding, adequate diagnostic measures are indicated. 7. Patients with a history of psychic depression should be carefully observed and the drug discontinued if the depression recurs to a serious degree. 8. Any possible influence of prolonged NORINYL-1 therapy on pituitary, ovarian, adrenal, hepatic or uterine function awaits further study. 9. A decrease in glucose tolerance has been observed in a small percentage of patients on oral contraceptives. The mechanism of this decrease is obscure. For this reason, diabetic patients should be carefully observed while receiving NORINYL-1 therapy. 10. Because of the occasional occurrence of thrombophlebitis and pulmonary embolism in patients taking oral contraceptives, the physician should be alert to the earliest manifestations of the disease. 11. Because of the effects of estrogens on epiphyseal closure, NORINYL-1 should be used judiciously in young patients in whom bone growth is not complete. 12. Th age of the patient constitutes no absolute limiting factor, although treatment with NORINYL-1 may mask the onset of the climacteric. 13. The pathologist should be advised of NORINYL-1 therapy when relevant specimens are submitted.

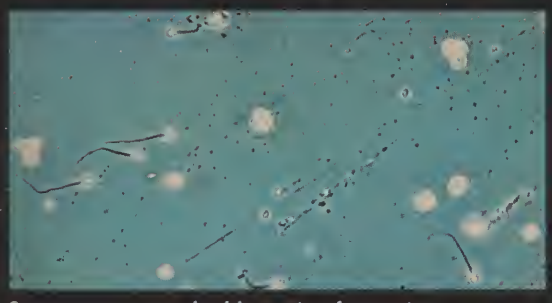
Side effects observed in patients receiving oral contraceptives: The following adverse reactions have been observed in patients receiving oral contraceptives: nausea, vomiting, gastrointestinal symptoms (su as abdominal cramps and bloating) breakthrough bleeding, spotting, change in menstrual flow, amenorrhea, edema, chloasma or melasma, breast changes (tenderness, enlarge ment and secretion), change in wei (increase or decrease), changes in cervical erosion and cervical secreti suppression of lactation when give immediately postpartum, cholestat jaundice, migraine, rash (allergic), rise in blood pressure in susceptibl individuals, mental depression.

Although the following side effects have been reported in users of oral contraceptives, no cause and effect relationship has been established: anovulation post-treatment, premenstrual-like syndrome, chang in libido, changes in appetite, cystit like syndrome, headache, nervousn dizziness, fatigue, backache, hirsutism, loss of scalp hair, erythema multiforme, erythema no sum, hemorrhagic eruption, itchin

The following occurrences have be observed in users of oral contracep tives (a cause and effect relationshi has been neither established nor d proved): thrombophlebitis, pulmon embolism, neuro-ocular lesions.

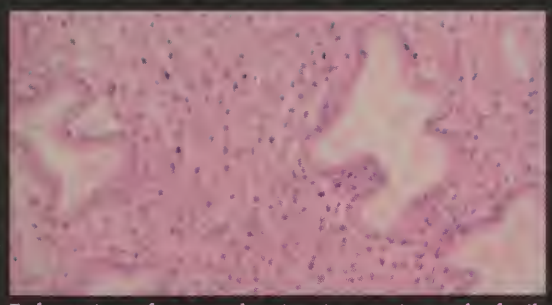
The following laboratory results may be altered by the use of oral contraceptives: increased sulfobromophthalein and other hepatic function tests, coagulation tests (increase in prothrombin, Factors VII, VIII, IX and X), thyroid function (increase in PBI and butanol extractable protein-bound iodine a decrease in T^3 values), metyrapone test, pregnanediol determination.

norethindrone — an original steroid from
SYNTEX
LABORATORIES INC., PALO ALTO, CALIF



Here's why Norinyl-1 makes medical sense.

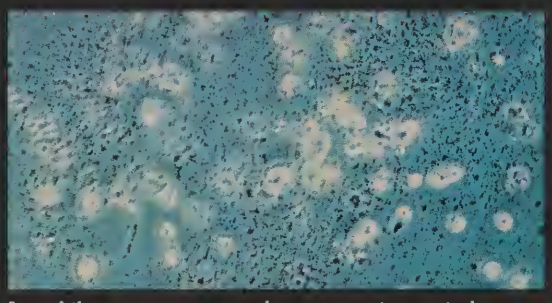
The effectiveness of Norinyl-1 as a low-dose oral contraceptive may be explained by its possible multiple action. In addition to its primary action of suppression of ovulation, Norinyl-1 may offer additional protective mechanisms... (1) creation of a cervical mucus that may be hostile to sperm penetration, and (2) development of an endometrium that may be out of phase with nidation. These effects are illustrated below.



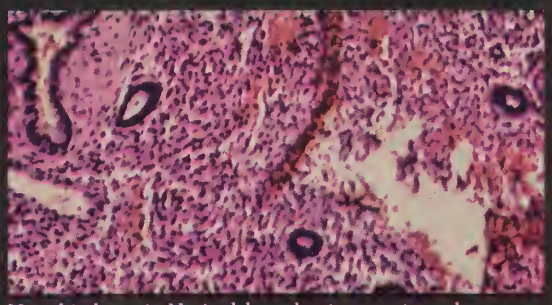
Untreated Patient

Cervical mucus at midcycle is usually thin and watery, with Spinnbarkeit (stretchability) of 15 to 20 cm.

Spermatozoa appear healthy, active, freemoving.



Endometrium of untreated patient is receptive to the fertilized ovum during secretory phase.



Norinyl-1 Patient

Cervical mucus at midcycle is scanty, viscous—with Spinnbarkeit of 1 cm. or less.

Immobile spermatozoa as they appear in cervical mucus taken from patient treated with Norinyl-1.

Norethindrone in Norinyl-1 accelerates secretory phase, suppresses glandular and vascular development.

Norinyl®-1
(norethindrone 1mg. & mestranol 0.05mg.) tablets

- new low dose of time-proved ingredients
- established norethindrone/mestranol ratio
- lower patient cost

Night Leg Cramps . . . Unwelcome Bedfellow

In Diabetes[1], Arthritis[2], and Peripheral Vascular Disorders[2]

now . . . specific therapy for night leg cramps

Walker

QUINAMM™

Consistently effective, QUINAMM provided complete relief in 94% of 200 patients studied, many of whom were severe cases refractory to other medication.[3] Your prescription for one tablet at bedtime often controls painful night cramps with the initial dose . . . helps restore restful sleep.

THE NATIONAL DRUG COMPANY
DIVISION OF RICHARDSON-MERRELL INC
PHILADELPHIA, PENNSYLVANIA 19144

Prescribing Information: Composition: Each white, beveled, compressed tablet contains: Quinine Sulfate 260 mg. and Aminophylline 195 mg. **Contraindication:** QUINAMM is contraindicated in pregnancy because of its quinine content. **Precautions:** Aminophylline may produce intestinal cramps in some instances, and quinine may produce symptoms of cinchanism, such as tinnitus, dizziness, and gastrointestinal disturbance. Discontinue use if ringing in the ears, deafness, skin rash, or visual disturbances occur. **Dosage:** One tablet upon retiring. Where necessary, dosage may be increased to one tablet following the evening meal and one tablet upon retiring. **Supplied:** Bottles of 100 and 500 tablets.

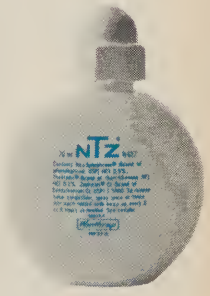
6/67 Q-706A

"The inconvenience of a cold"

For a cold, NTz® Nasal Spray provides rapid relief of nasal symptoms. Relief starts with the first spray which opens the inferior part of the common meatus. A second spray, a few minutes later, will shrink the turbinates to help provide sinus drainage and ventilation. Dosage may be repeated every three or four hours as needed, for temporary relief of symptoms. NTz is well tolerated but overdosage should be avoided.

As sinusitis deterrent, NTz Nasal Spray can be used to keep the nasal passages open during a cold to help prevent development of acute sinusitis—or to help prevent the acute condition from becoming chronic.



Supplied: NTz Nasal Spray, plastic squeeze bottles of 20 ml.; NTz Nasal Solution, bottles of 30 ml. (1 fl. oz.) with dropper.

NTz is more than a simple vasoconstrictor. It contains

Neo-Synephrine® (brand of phenylephrine) HCl 0.5 per cent, the major component, virtually synonymous with fast, efficient but gentle nasal vasoconstriction.

Thenfadil® (brand of thenyldiamine) HCl 0.1 per cent, topical antihistamine for reduction of rhinorrhea, sneezing or itching. It combats the allergic reactions that may occur in colds or sinusitis.

Zephiran® (brand of benzalkonium, as chloride, refined) 1:5000, antiseptic preservative and wetting agent to promote penetration and spread of the formula.

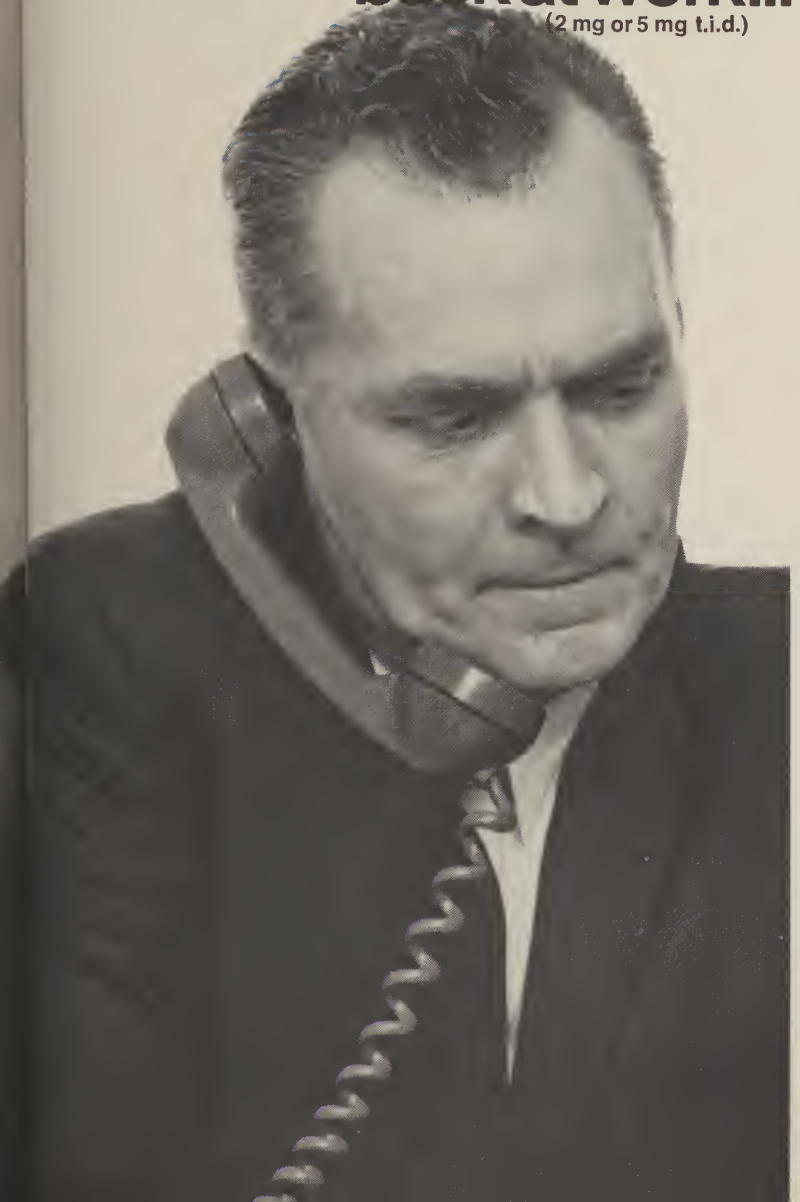
Winthrop Laboratories, New York, N.Y. 10016 Winthrop

Valium® (diazepam) useful adjunct for the coronary patient...

When oppressive feelings and psychic tensions are severe and cooperation with the physician poor, it may be helpful to add adjunctive Valium (diazepam), 10 mg or 5 mg t.i.d., to the coronary patient's regimen. Valium (diazepam) helps to promote the needed relaxation that the patient requires to make him less preoccupied with his condition and more inclined to cooperate in, and benefit from, the total therapeutic program. Valium (diazepam) may be administered in the presence of secondary depressive symptoms.

in the hospital...

(5 mg. or 10 mg t.i.d.)



convalescing...
(2 mg or 5 mg t.i.d.)

The heart patient who leaves the hospital to enter a period of slow restorative treatment is often forced to make emotionally difficult adjustments. The resulting stress of this period may again cause psychic tension to mount to potentially harmful levels. To augment your reassurance and the emotional support of his family, a 2 mg or 5 mg t.i.d. regimen of Valium (diazepam) can reduce psychic tension and thereby help the patient to accept necessary restrictions more calmly, and to adjust to his illness more realistically.

Getting back to work presents additional stresses for the cardiac patient. There are often anxiety-producing features in the job which can be more significant than the physical or intellectual demands of the work. Valium (diazepam), 2 mg or 5 mg t.i.d., may be a useful adjunct to reduce overreaction to these stresses and thus help the patient to face job situations more calmly and rationally.

back at work...
(2 mg or 5 mg t.i.d.)

Valium® (diazepam)
to help relieve psychic tension

and for the patient with tension-induced sleeplessness, remember the value of an extra tablet at bedtime

Before prescribing, please consult complete product information, a summary of which follows:

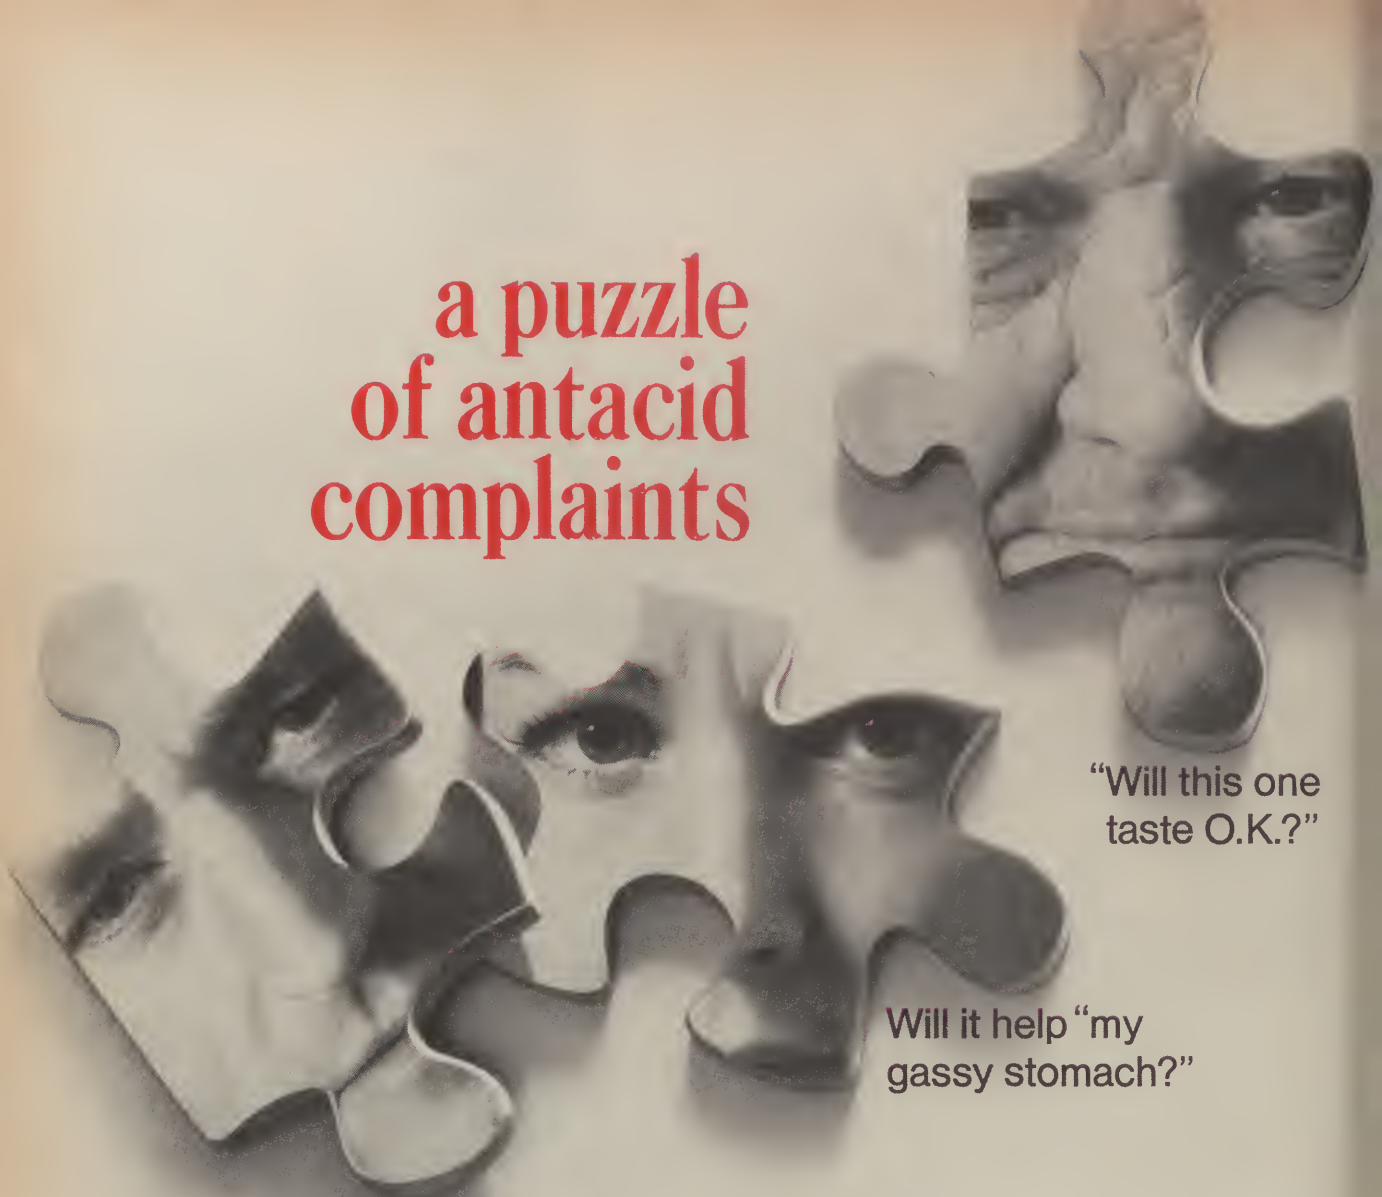
Indications: Tension and anxiety states, moderate to severe psychoneurotic states with anxiety, apprehension or agitation alone or with depressive symptoms; somatic complaints which are concomitants of emotional factors; acute agitation due to alcohol withdrawal; muscle spasm associated with cerebral palsy and athetosis.

Contraindications: Infants, patients with history of convulsive disorders, glaucoma or known hypersensitivity to drug.

Warning: Not of value in the treatment of psychotic patients, and should not be employed in lieu of appropriate treatment.

Precautions: Limit dosage to smallest effective amount in elderly or debilitated patients (not more than 1 mg, one or two times daily initially) to preclude ataxia or oversedation, increasing gradually as needed or tolerated. As is true of all CNS-acting drugs, until correct maintenance dosage is established, advise patients against possibly hazardous procedures requiring complete mental alertness or physical coordination. Driving during therapy not recommended. In general, concurrent use with other psychotropic agents is not recommended. If such combination therapy is used, carefully consider individual pharmacologic effects—particularly with known compounds which may potentiate action of Valium (diazepam), such as phenothiazines, barbiturates, MAO inhibitors and other antidepressants. Advise patients against simultaneous ingestion of alcohol or other CNS depressants. Safe use in pregnancy not established. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Observe usual precautions in impaired renal or hepatic function. Periodic blood counts and liver function tests advisable in long-term use. Cease therapy gradually.

Side Effects: Side effects (usually dose-related) are fatigue, drowsiness and ataxia. Also reported: mild nausea, dizziness, blurred vision, diplopia, headache, incontinence, slurred speech, tremor and skin rash; paradoxical reactions (excitement, depression, stimulation, sleep disturbances, acute hyperexcited states, hallucinations); changes in EEG patterns during and after drug treatment. Abrupt cessation after prolonged overdosage may produce withdrawal symptoms (convulsions, tremor, abdominal and muscle cramps, vomiting, sweating) similar to those seen with barbiturates, meprobamate and chlordiazepoxide HCl.



Dosage—Adults: Mild to moderate psychoneurotic reactions, 2 to 5 mg b.i.d. or t.i.d.; severe psychoneurotic reactions, 5 to 10 mg t.i.d. or q.i.d.; alcoholism, 10 mg t.i.d. or q.i.d. in first 24 hours, then 5 mg t.i.d. or q.i.d. as needed; muscle spasm with cerebral palsy or athetosis, 2 to 10 mg t.i.d. or q.i.d.

Geriatric patients: 1 or 2 mg/day initially, increase gradually as needed and tolerated. (See Precautions.)

Supplied: Valium® (diazepam) Tablets, 2 mg, 5 mg and 10 mg; bottles of 50 and 500.

helps restore normal motility and tone

CANTIL®

(mepenzolate bromide)

Diarrhea and other symptoms of common G.I. disorders can often be curbed with Cantil (mepenzolate bromide), bringing welcome relief to the harassed patient. Relatively specific for the hyperactive colon, it helps reduce diarrhea, pain and spasm with minimal effect on other viscera. Cantil (mepenzolate bromide) is indicated whenever these symptoms are associated with irritable colon, gastroenteritis, diverticulitis, and mild to moderate ulcerative colitis.

It is an anticholinergic drug without narcotic properties. Side effects are usually mild.

LAKESIDE

CONTRAINDICATIONS: Sensitivity to Cantil® (mepenzolate bromide), glaucoma, G.I. or G.U. obstruction, toxic megacolon. WARNINGS: Possibility of adverse reactions in advanced severe ulcerative colitis and atypical agitated reactions to phenobarbital in the elderly (Cantil with Phenobarbital). PRECAUTIONS: Cantil is of adjunctive use only; treatment of the underlying condition is indicated, be it organic or functional. Observe caution in conditions known to be incompatible with atropine-like drugs, e.g., open-angle glaucoma or prostatic hypertrophy. ADVERSE EFFECTS: Dry mouth; blurred vision; constipation; nausea; vomiting; bloating; dizziness; urinary retention. All are anticholinergic effects and usually tolerable. Habituation and idiosyncratic reactions to phenobarbital (Cantil with Phenobarbital) are possible, as is generalized rash. DOSAGE: One or two tablets three times a day and one or two at bedtime usually provide prompt relief. Cantil with Phenobarbital may be prescribed if sedation is required. HOW SUPPLIED: CANTIL (mepenzolate bromide)—25 mg. per scored tablet. Bottles of 100 and 250. CANTIL with PHENOBARBITAL—containing in each scored tablet 16 mg. phenobarbital (warning: may be habit forming) and 25 mg. mepenzolate bromide. Bottles of 100 and 250.

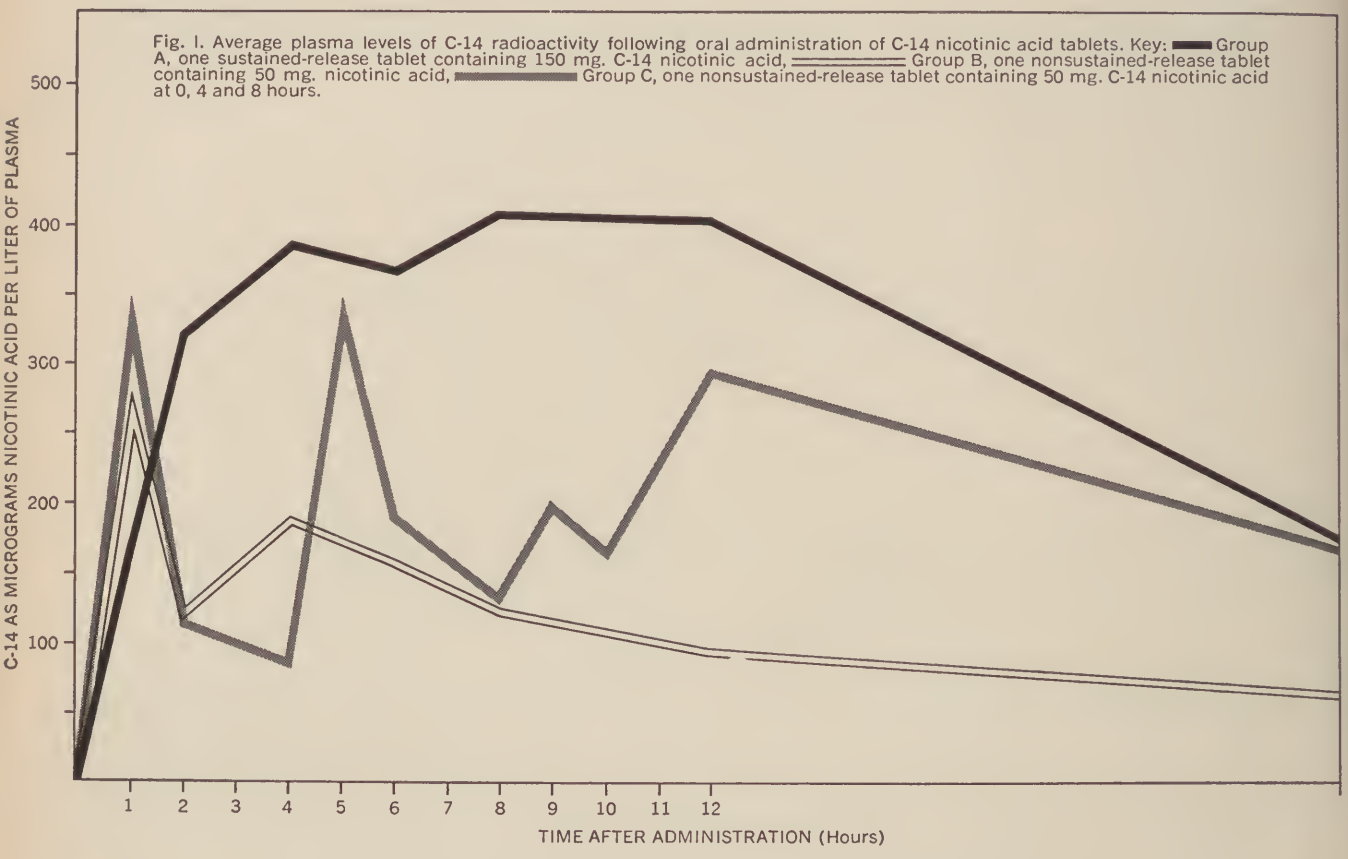
Regroton®



chlorthalidone 50 mg., reserpine 0.25 mg.

Indications: Hypertension. **Contraindications:** History of mental depression, hypersensitivity, and most cases of severe renal or hepatic diseases. **Warning:** With the administration of enteric-coated potassium supplements, which should be used only when adequate dietary supplementation is not practical, the possibility of small-bowel lesions (obstruction, hemorrhage, and perforation) should be kept in mind. Surgery for these lesions has frequently been required and deaths have occurred. Discontinue coated potassium-containing formulations immediately if abdominal pain, distention, nausea, vomiting, or gastrointestinal bleeding occur. Discontinue one week before electroshock therapy, and if depression or peptic ulcer occurs. *Use in pregnancy:* Regroton should be used in pregnant patients or in women of childbearing potential only when, in the judgment of a physician, its use is deemed essential to the welfare of the patients; adverse reactions (thrombocytopenia, hyperbilirubinemia, altered carbohydrate metabolism, etc.) are potential problems in the newborn.
Precautions: Antihypertensive therapy with Regroton should always be initiated cautiously in postsympathectomy patients and in patients receiving ganglionic blocking agents, other potent antihypertensive drugs, or curare. Reduce dosage of concomitant antihypertensive agents by at least one-half. To avoid hypotension during surgery, discontinue Regroton therapy two weeks prior to elective surgical procedures. In emergency surgery, use, if needed, anticholinergic or adrenergic drugs or other supportive measures as indicated. Because of the possibility of progression of renal damage, periodic kidney function tests are indicated. Discontinue if the BUN rises or liver dysfunction is aggravated. Hepatic coma may be precipitated. Electrolyte imbalance, sodium and/or potassium depletion may occur. If potassium depletion should occur during therapy, Regroton should be discontinued and potassium supplements given, provided the patient does not have marked oliguria. Take particular care in cirrhosis or severe ischemic heart disease and in patients receiving corticosteroids, ACTH, or digitalis. Salt restriction is not recommended. Use cautiously in patients with ulcerative colitis or gallstones (biliary colic may be precipitated). Bronchial asthma may occur in susceptible patients. **Adverse Reactions:** The drug is generally well tolerated. The most frequent side effects are nausea, gastric irritation, vomiting, diarrhea, constipation, muscle cramps, headache, dizziness and acute gout. Other potential side effects include angina pectoris, anxiety, depression, bradycardia and ectopic cardiac rhythms (especially when used with digitalis), drowsiness, dull sensorium, hyperglycemia and glycosuria, hyperuricemia, lassitude, restlessness, transient myopia, impotence or dysuria, orthostatic hypotension which may be potentiated when chlorthalidone is combined with alcohol, barbiturates or narcotics, leukopenia, aplastic anemia, skin rashes, thrombocytopenia, agranulocytosis, nasal stuffiness, increased gastric secretions, nightmare, purpura, urticaria, ecchymosis, weakness, uveitis, optic atrophy and glaucoma, and pruritus. Eruptions and/or flushing of the skin, a reversible paralysis agitans-like syndrome, blurred vision, conjunctival injection, increased susceptibility to colds, dyspnea, weight gain, decreased libido, dryness of the mouth, deafness, anorexia, and pancreatitis when epigastric pain or unexplained G.I. symptoms develop after prolonged administration. Jaundice, xanthopsia, paresthesia, photosensitization and necrotizing angiitis are possible. **Average Dosage:** One tablet daily with breakfast. **Availability:** Pink, single-scored tablets in bottles of 100 and 1000. (B) 46-600-B
For details, see complete Prescribing Information.

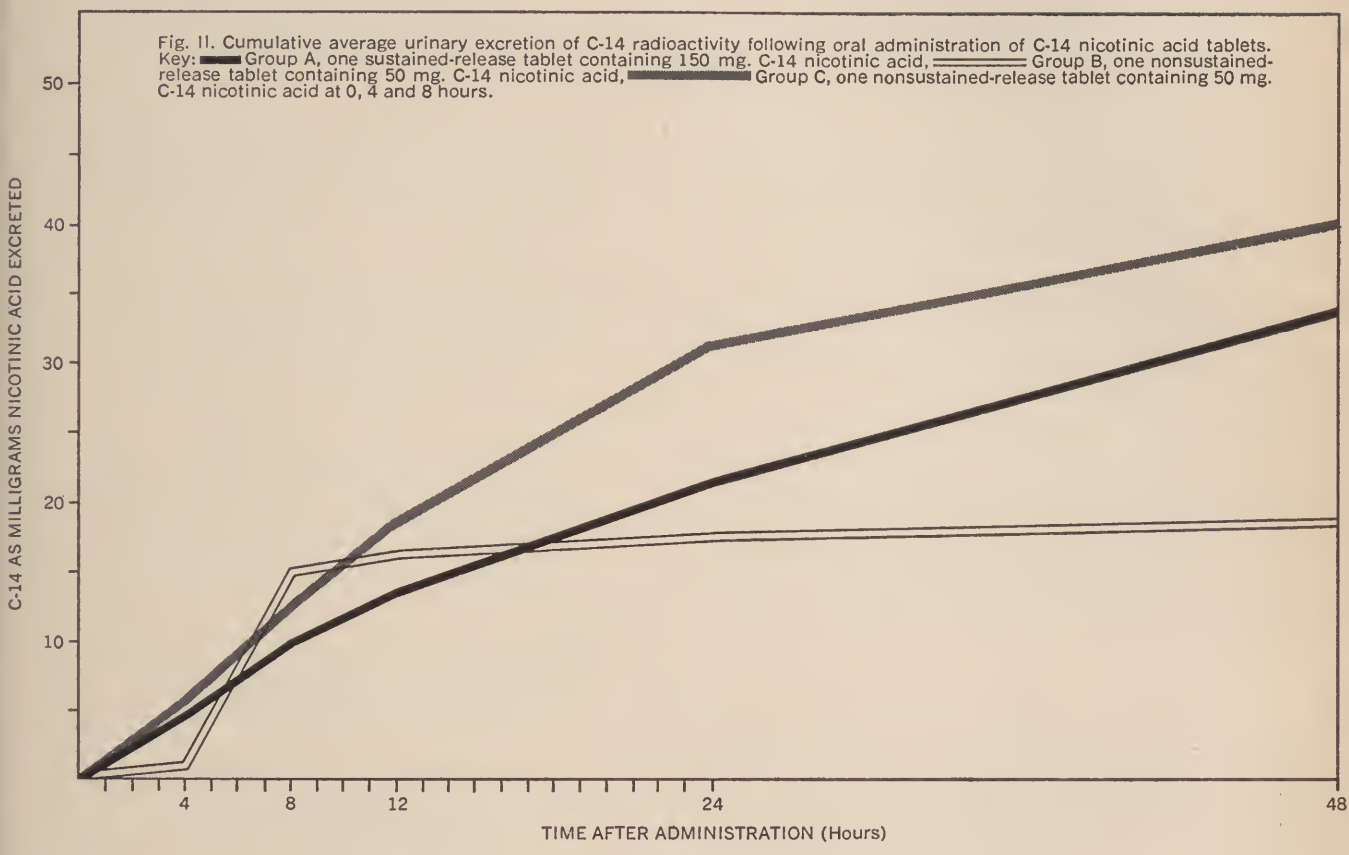
Geigy

Sustained circulatory, respiratory and cerebral stimulation for the

(fewer absent doses by absent-minded patients)



Human volunteer subjects were administered Geroniazol TT tablets with the nicotinic acid component made radioactive with C-14. Plasma and urine samples were analyzed. (See Figures I and II) The radioactive tracer study substantiated the previous clinical evidence that the release of nicotinic acid from the Geroniazol TT tablet produced a gradual rise in plasma levels to a plateau for a total of 12 hours and more.

Such proven sustained activity makes the management of geriatric patients much easier by minimizing the possibility of neglected doses through absent-mindedness or senile confusion. Therapy *can* be continuous on a daily dose of only one Geroniazol TT tablet every 12 hours.

The gradual release of nicotinic acid in Geroniazol TT will provide the well-known peripheral vasodilatation needed in patients with deficient circulation and with a minimum amount (if any) of "flushing." Also, cerebrovascular circulation is complemented by pentylenetetrazol, long-established as a cerebral and respiratory stimulant.

Geroniazol TT improves the typical, unfortunate, signs of senile confusion. Patients become more alert,

aged and debilitated

less confused and moody. Personal care, memory, emotional stability, social attention improve. Fatigue, apathy and irritability are reduced.

A prescription for 100 tablets of Geroniazol TT will permit your patients to enjoy the benefits of time-prolonged nicotinic acid/pentylenetetrazol therapy, at an economical price. Dosage is only one tablet every 12 hours.

Contraindications: There are no known contraindications.

Precautions: Exercise caution when treating patients with a low convulsive threshold.

Side Effects: Side effects are rarely encountered, however due to the vasodilatation effect of nicotinic acid, transitory mild nausea, flushing, tingling and pruritus are possible.

Dosage: One tablet every 12 hours.

Supplied: Prescribe bottles of 100 tablets, to take advantage of recent price reduction.

See previous issues of the JOURNAL for information about other speakers—See the ANNUAL MEETING PROGRAM, for complete information about speakers and various functions—Copy will be mailed to all members and to others upon request.

Dr. Sones

F. MASON SONES, MD, will speak on Wednesday, April 17, at the Alcazar in Baltimore. His subject will be **CINE CORONARY ARTERIOGRAPHY IN EVALUATING MEDICAL AND SURGICAL THERAPY FOR CORONARY ATHEROSCLEROSIS.** Dr. Sones received his AB from Western Maryland College in Westminster, Maryland, and his MD from the University of Maryland School of Medicine. He served an internship at the University of Maryland Hospital and a residency in internal medicine and cardiovascular disease at The Henry Ford Hospital. From 1950 until 1966, he was Director of the Cardiac Laboratory and Pediatric Cardiology at the Cleveland Clinic Foundation, and in 1966 was appointed Director of Department of Cardiovascular Disease and the Cardiac Laboratory, Cleveland Clinic Foundation. Since 1955, Dr. Sones's primary interest has been in the development of techniques combining cardiac catheterization with high speed X-ray motion picture techniques for clinical application to the diagnosis of lesions in the central circulation. Dr. Sones is a Fellow of the American College of Chest Physicians, American College of Cardiology, Council on Clinical Cardiology and Council on Epidemiology of the American Heart Association. Among the many awards conferred on Dr. Sones are: The Golden Eagle Award for Cinematography; the American College of Chest Physicians Film Award; Distinguished Achievement Award, Modern Medicine; Theodore and Susan Cummings Humaritarian Award; Duff Memorial Lecturer, Council on Atherosclerosis, American Heart Association; Jackson Memorial Lecturer, New England Cardiovascular Society; Rigler Memorial Lecture, University of Minnesota; and the Haile Selassie Lecturer, Royal College of Physicians, London.

Dr. Baum

STANLEY BAUM, MD, Associate Professor of Radiology, University of Pennsylvania School of Medicine, will give a paper on **RECENT ADVANCES IN X-RAY DIAGNOSIS OF SURGICAL DISEASES** on Friday, April 19, at the Alcazar, Baltimore. After receiving his BA at the University College of Arts and Science of New York University, Dr. Baum received his MD at the Faculty of Medicine, University of Utrecht, Holland. He did postgraduate work at the Graduate School of Medicine of the University of Pennsylvania and in 1961 received a Certificate of Satisfactory Completion and Eligibility for Advanced Degree. Dr. Baum served an internship at the Kings County Hospital Medical Center and a radiology residency at the Graduate Hospital of the University of Pennsylvania. These were followed by a traineeship of the National Cancer Institute, and a fellowship in cardiovascular radiology at Stanford University Medical Center. He was board certified by the American College of Radiology in 1963. Dr. Baum has participated in the development of scientific exhibits which have been displayed, and received awards, at national, regional, and state medical meetings. He is the author or co-author of numerous published articles and chapters of medical books. Dr. Baum is Assistant Radiologist at the Graduate Hospital of the University of Pennsylvania, and Consultant in Cardiovascular Radiology at the Veterans Administration Hospitals both in Philadelphia and Wilmington, Delaware.

THE MONTH IN WASHINGTON

Dwight L. Wilbur, MD, president-elect of the American Medical Association, warned that physicians will resist any effort to establish national medical standards under the Regional Medical Programs.

But he predicted that the medical profession would cooperate enthusiastically if the programs are carried out on a voluntary cooperative basis.

Dr. Wilbur spoke at a conference on Regional Medical Programs sponsored by the Department of Health, Education and Welfare.

"If the program in fact is clearly one designed to catalyze and to facilitate the development of better programs than now exist to serve patients and their physicians, it will undoubtedly receive enthusiastic cooperation from the medical profession and related groups," Dr. Wilbur said. "We know that the law and its legislative history stress the voluntary cooperative nature of the program and that interference with existing patterns is specifically prohibited. . . .

"Unlike many other countries, our nation has reached its preeminence in many areas of activity because of this unique combination of multiple independent focal points of activity cooperating on a voluntary basis to achieve a commonly desired goal. . . .

"If RMP maintains its current emphasis on the working together of regional groups, it will fulfill its purpose of improving the quality, accessibility and availability of health care, physician and institutional performance, and consumer satisfaction.

"On the other hand, if RMP becomes an instrument for the establishment of national standards with the coercive compliance compelled by such standards, it will arouse nationwide resistance from physicians, institutions, and allied health professionals. What can be gained by cooperation and meaningful participation will surely be lost if the use of coercive power, which for the moment lies dormant in Public Law 89-239, becomes its dominant characteristic. . . .

"RMP is in a strategic position to bring about changes acceptable both to physicians and their patients that will improve performance and patient satisfaction without undermining patterns of behavior that are traditional, and, more significant, considered by the medical profession essential to the preservation of high quality care."

* * *

The American Medical Association told Congress that weight reduction is a leading health area for quackery.

The AMA position on weight reduction, particularly as so-called diet pills are involved, was outlined by Theodore B. Van Itallie, MD, of New York, N.Y., a member of the Council on Foods and Nutrition, and Harry C. Shirkey, MD, of Birmingham, Ala., vice chairman of the Council on Drugs, in testimony before the Senate Antitrust and Monopoly Subcommittee.

The subcommittee was investigating reports that some osteopaths and physicians were making large incomes from assembly-line administration of multi-colored "diet" pills containing such drugs as barbiturates, thyroid extract, amphetamines, thiazine, diuretics, laxatives and various hormones.

Officials of Illinois and Oregon testified that such pills were involved in at least 20 deaths in their states.

"Perhaps in no other area of health and medical problems do we encounter as much food faddism and quackery," Dr. Van Itallie testified. "The obese are extremely gullible, forever willing to believe that someday a gadget, a diet, a pill, or a book will lead to the miracle of easy and painless reduction of weight. While most of the quackery originates with health hucksters who have no scientific background, training, or qualifications in the medical or nutritional fields, unfortunately a physician is occasionally involved.

"The American Medical Association has long utilized its various publications to bring to the profession and the public up-to-date information on the latest scientific advances in the area of

obesity control. It frequently focuses attention upon those irregular practitioners and faddists who prey upon the unsuspecting public. As the national voice of Medicine, we believe that it is incumbent upon us to help protect the public from those practices which have the potential of adversely affecting the public health. . . .

"A physician who assumes the responsibility for treating obesity takes on a difficult role. Few other medical disorders require the same disciplined and prolonged cooperation of the patient in their treatment. Even under the best of circumstances, the results of treatment become apparent slowly. The inherent handicaps may strain the busy physician's patience and tempt him to resort to unsound methods of treatment. He must have a clear understanding of the physiological and psychological problems of obesity in order to treat it wisely."

Dr. Shirkey broke down weight drugs into seven general classifications: (1) cardiac glycosides; (2) hormones, chiefly thyroid; (3) diuretics; (4) anorexiants (appetite suppressants); (5) laxatives; (6) sedatives; and (7) antispasmodics. Of them he said:

Cardiac glycosides: "Their use for obesity is reprehensible and may well have attributed to the few reported deaths of patients receiving such treatment."

Hormones—Thyroid: "There are at least three irrationalities . . . in this hormonal approach to the treatment of obesity."

Diuretics: "There is no rational basis for the use of diuretic drugs in the treatment of simple obesity."

Anorexiants: "Amphetamines are useful as a crutch to help the patient become accustomed to a rigorous reducing diet. But long-term administration is not justified because they tend to become less effective and, in addition, can lead ultimately to habituation."

Laxatives: "There is little rational basis for the use of laxatives in the treatment of obesity."

* * *

President Johnson said the administration would take additional steps to abate the increases in health care costs and to increase the numbers of health personnel.

In his economic message to Congress, he said, "The supply of qualified health personnel has lagged behind the expanding demand. I will shortly propose new measures to increase this supply.

"Last year, medical care prices rose 7%, more than twice as fast as other prices. I shall propose new measures to slow down the spiraling cost of health care."

In his State of the Union message, the President included in a list of "absolutely intolerable" conditions which he said had existed for many years: "Hospital and medical costs are high, and they are rising." He did not amplify the brief statements in either of these two messages, leaving the details for a later health message to Congress.

Chairman Abraham A. Ribicoff (D., Conn.) said the Senate Government Operations Committee would conduct a two-year investigation into the rise in hospital and other health care costs. He said the subcommittee's study also would be concerned with the numbers of physicians and other health personnel.

Mr. Johnson said he also would propose a child health program and stricter penalties for those who traffic in LSD and other dangerous drugs. The child health program would provide poor families over the next five years with health service from prenatal care of the mother through the child's first year.

The budget for the Department of Health, Education and Welfare allotted $66 million for medical education in fiscal 1969, for the year beginning next July 1, an increase of more than $16 million. Federal aid for allied health training was increased from $19 million to $19.2 million.

Medicare expenditures for fiscal 1969 were estimated at $6.3 billion, compared with $5.7 billion for the current fiscal year.

Family planning programs of the federal government would be greatly expanded. The goal is to provide birth control information to one million women by quadrupling the size of the family planning services budget from $6 million to $24 million.

National

Poison Prevention Week:

March 17-23

To keep us reminded of the seriousness of accidental poisonings, the National Planning Council is observing its 7th annual National Poison Prevention Week, March 17-23.

This year an estimated 500,000 children will be victims of accidental poisonings. Ninety percent of all cases reported involve children under 5 years of age.

As one of the 21 agencies comprising the National Planning Council, the AMA strongly urges all state and local medical societies to help reduce the incidence of poisonings in the community by alerting all citizens to the proper use and storage of potentially haardous substances. To assist the medical societies in implementing local poison prevention campaigns, a packet of materials is available, free of charge. Write Henry L. Verhulst, Secretary, National Planning Council, US Public Health Service, 7915 Eastern Ave., Silver Spring, Md. 20910.

In addition, the AMA has several pamphlets on poison prevention. "Danger Lurks," "Medicines and How to Use Them," and "Protecting Your Home from Unlabeled Poisons" are available from the AMA Order Handling Department for 10 cents each. The "First Aid Manual" is 15 cents each or $12 per hundred.

Remember—National Poison Prevention Week makes every week poison prevention week.

In Honor of Our Doctors

Doctors' Day—March 30th

*There are men and classes of men that stand above the common herd: the soldier, the sailor and the shepherd not unfrequently; the artist rarely; rarelier still, the clergyman; the physician almost as a rule. He is the flower (such as it is) of our civilisation; and when that stage of man is done with, and only remembered to be marvelled at in history, he will be thought to have shared as little as any in the defects of the period, and most notably exhibited the virtues of the race. Generosity he has, such as is possible to those who practise an art, never to those who drive a trade; discretion, tested by a hundred secrets; tact, tried in a thousand embarrassments; and what are more important, Heraclean cheerfulness and courage. So it is that he brings air and cheer into the sickroom, and often enough, though not so often as he wishes, brings healing.**

Doctors' Day is a special day observed each year to honor the members of the medical profession who have devoted their lives to the art of healing. March 30th, the official date, commemorates one of the greatest discoveries for the alleviation of pain and suffering for on this day in 1842, Dr. Crawford W. Long first used ether anesthesia in surgery. The red carnation was chosen in 1949 as the symbol of Doctors' Day.

In recognition of the doctors' contributions to the people and communities they serve, the Heart Association of Maryland will dedicate their window with a display in honor of Doctors' Day.

Also in honor of Doctors' Day, a contribution will be made by our auxiliary to the American Medical Association Education and Research Foundation, to be divided equally between The Johns Hopkins and The University of Maryland Schools of Medicine.

Mrs. Max R. English, President
Woman's Auxiliary to the Baltimore City Medical Society

Mrs. Raymond L. Markley, Chairman
Doctors' Day

March, 1968

THE THREAT TO MEDICINE

The threat to our medical freedom is a lot more subtle than that which we face from our government. It comes from our brethren in the field of hospital administration. These gentlemen have gone far in their quest for power as evidenced by the attitude of a recent applicant for the post of hospital administrator. In referring to his previous hospital, he described the hospital as "his" hospital and the doctors as "his" doctors and the board of directors as "his" board of directors. To him, all of these people have a subservient function to his ultimate aims. These aims are to form medical centers in which the hospital administrator would direct all activities.

The hospital administrator, at one time, was a man of consequence and upon his shoulders fell the burden of the financial solvency of the hospital. Today, he has little to worry about, all he has to do is operate within the Blue Cross formula which is not always the most economical.

The responsibility for the high cost of hospitalization is directly attributable to these gentlemen; they have a tendency to create small empires and to be wasteful in manpower and materials. The abuses in the field of hospital administration are brought about by the fact that hospital administrators operate in an area which could be well described as a "no man's land" consisting of a board of directors, with the medical staff somewhere in the background.

Under the pretext of conflict of interest the administrator is able to keep these two boards far apart. Under the guise of conflict of interest there is very little communication between these two boards except through the hospital administrator, who is able to present his own views to the ruling body.

The cost of hospitalization has skyrocketed while the doctor's fee has remained relatively stationary. The unknowing public makes little or no distinction between the cost of hospitalization and the fees of practicing physicians. The resulting consequence is that the medical profession as a whole bears the brunt of the criticism while the hospital administrator goes blithely about his business.

I contend that to remedy this situation more doctors should participate in the decisions of the board of trustees as trustees. Instead, an ever increasing chasm between administrators and doctors is becoming more apparent as time passes. The current trend seems to be to relegate the doctor to anonymity, the status of the doctor dwindles and the status of the administrator takes on greater dimensions. Perhaps it is time for a self evaluation by the administrator. It would seem that the administrator has lost sight of the fact that it is the doctor and patient around whom the hospital revolves.

There is no question that the "concept" of total medical care for patients would be enhanced if there were more communication between the board of directors and the doctors. There is also no question that the operation of the hospital would be much more economical and efficient.

The Author

The practice of medicine on the Antarctic continent is not unlike the practice of military medicine in less remote areas of the world. One is generally dealing with a young, healthy population which is exposed to environmental hardships, heavy work, and long hours. In this situation preventive medicine assumes paramount importance.

ROBERT M. BEAZLEY, MD
Former Officer in Charge and Medical Officer,
Amundsen Scott South Pole Station, Antarctica
Currently Resident in Surgery,
University of Maryland Hospital

MEDICAL OFFICER AT 90° SOUTH

Captain Hedblom, MC, USN, has likened the polar medical officer to a life guard "who seems to spend most of his time directing traffic, stopping dog fights, answering questions by the thousands, and sweeping out locker rooms. When occasion arises however, the guard must be able to quickly and efficiently rescue the drowning and expertly apply resuscitative measures should they be necessary. Practically, the life guard's most lasting contribution to society lies in his teaching of swimming, life saving, and water safety."[1]

From my experiences as Officer in Charge and Medical Officer at the Amundsen Scott South Pole Station I can enthusiastically appreciate Captain Hedblom's parallel.

The U.S. Navy's medical program in Antarctica is largely one of preventive medicine. This begins with the initial screening of volunteers. Strict physical and dental requirements, formulated from experience, are laid out in the Manual of the Medical Department, U.S. Navy, Section 15-31. The screening physical examination is frequently performed by a physician who is an Antarctic veteran. Obviously, recurrent back trouble, history of internal derangement of the knee, or any evidence of peripheral vascular disease would be disqualifying.

Minor findings on a State-side physical can become major problems in the remoteness of Antarctica. For instance, the "few skin tags" noted on my radioman's initial physical examination became prolapsed gangrenous hemorrhoids several weeks after arrival at the South Pole. This resulted in a three-thousand mile air evacuation for treatment and the loss of four weeks of vital manpower. The initial physical examination, probably one of the most stringent in the Navy, generally turns away 10 to 20% of the "healthy" volunteers. This examination is followed by intensive psychological testing and psychiatric interviewing which turns away another 10 to

The opinions and assertions expressed herein are those of the author, and are not to be construed as reflecting the views of the Navy Department or of the naval service at large.

20% of the volunteers. The selected "Winter-Over Volunteer" is general twenty-five to twenty-seven years of age, married, a petty officer with approximately eight years of Naval service, and of exceptional technical ability. Further informal screening is done by his superiors during the eight- to ten-month training period before deployment to the "Ice" in September of each year. The validity of these screening procedures, particularly the psychiatric screening, is attested to by the negligible number of volunteers who have left the "Ice" before completion of their tour of duty.

I found the station's outside environment to be less of a health hazard than I had anticipated. We were able to work outside for prolonged periods during the summer (October through February). At temperatures of minus 18° Fahrenheit, clothing worn in the middle Atlantic states at temperatures twenty to thirty degrees warmer was sufficient.

The absence of humidity on the Polar plateau, the continual sunlight of the Austral summer, and the near absence of ground winds made the work day relatively pleasant. However, the absence of humidity was dramatically offset during the winter by the twenty-four hour darkness (March through September) and the seemingly constant ground winds of ten to twenty knots. During this period, the monthly average temperature might be in the minus 80's. Necessity dictated that daily outside duties be accomplished at these temperatures. Outdoor work periods of sixty to ninety minuthes were tolerated by most men with only mild discomfort. In fact, the entire station's crew worked outside shoveling snow into the snowmelter on 25 July 1965, when we experienced a record low of minus 113° degrees Fahrenheit. Everyone quickly learned that care must be taken while outdoors to avoid "frost nip" or first degree frostbite. Frostnip, the equivalent of a moderate sun burn, can occur in forty-five seconds when finger tips, nose, ears, or malar prominences are exposed to wind at these extreme temperatures. Although I encountered almost daily cases of insignificant "frost nip," fortunately there were only three cases of second degree frostbite. Two of the cases involved the hands and the third involved the plantar surfaces of both heels. All recovered with the rapid rewarming technique and conservative therapy.

The Austral summer is met with unbelievable activity by the Navy and the United States Antarctic Research Program's scientific people. The Navy is charged with the support of the scientific efforts. At the Amundsen Scott South Pole Station (1964-65) there were seven civilian scientists working in five disciplines ranging from seismology to ionospheric physics. These men were backed up by 14 Navy volunteers. Most of the summer was spent in new construction and

Main Entrance Tunnel, South Pole Station—Black dome to the left is Rawin dome house tracking antennae for weather balloons. Surface building to the right is the aurora observation building used during the winter season in observing and recording the "Aurora Australis."

Blowing snow obscures the sun and surface topography at the South Pole Station.

repair of existing facilities, as well as resupply. During the summer nearly 120 ski-equipped C-130 aircraft landed at the station off loading in excess of two-million pounds of fuel and cargo. The hazards of any type of heavy cargo operation are obvious. However, these were compounded by the low temperatures which precluded shutting down the aircraft's turboprop engines. In addition to prop blast, high noise level, and frequent poor visibility, the station's altitude of 9,200 feet made man-handling 55-gallon fuel drums and JATO bottles pure torture. The average barometric pressure was twenty and eight hundredths inches of mercury[2] which is equivalent to an evaluation of about ten thousand feet. At this level the oxygen concentration of air is reduced to 14% or about two thirds that at sea level. Concomitantly, hemoglobin saturation is 90%. Initially, most men felt the effects of altitude sickness namely, dizziness, headache, and occasional nausea. However, after two to three days the obvious effects wore off and the men were able to perform their duties at a reduced pace. Within 30 days most men demonstrated elevation of blood values with hematocrits in the high fifties and a few in the low sixties. It was noted that the cold thin air would produce a mild tracheobronchitis if one exerted himself to the point of deep gasping type respirations. This was marked by moderate to severe retro-sternal burning seinsations, occasional blood-tinged sputa, and a chronic, non-productive cough. All personnel soon learned to cope with these rugged outside conditions and no lasting effects were experienced.

The internal environment of the station consisted of ten prefabricated buildings which over the past decade had been drifted in by the relentless blowing snow. Summer work and repair effects had succeeded in developing a system of covered passageways between adjacent buildings. Today, the resulting complex is buried by eight to ten feet of drifted snow. Living in such close quarters we were fortunate to be relatively free of respiratory infections. Once the last plane had departed in late February 1965, we were totally isolated from the outside world and managed to spend the winter . . . "cold" free. However, we were not without many of the other problems of crowded living. There was the ever present danger of fire from the oil-fired, hot air heaters found in each building, or from faulty or makeshift electrical wiring. The fire problem was compounded by the fact that we were living in a desert as far as water for fire fighting was concerned. For this reason, all personnel were given an intensive two-week course in dry chemical structural fire fighting prior to deployment. Carbon monoxide monitors in each building guarded us against the possibility of a report of Admiral Richard Byrd's 1934 *Alone* experience.[3] Other gases used on the station daily were equally as dangerous as carbon monoxide. Ammonia gas

used in the production of hydrogen for the weather balloons can be lethal. Its noxious fumes drove us from the station on Easter Sunday 1965 when the valve on a tank of liquid ammonia cracked due to low temperatures. In the summer of 1966, the recently constructed, specially designed balloon inflation shelter was leveled by a presumable hydrogen leak explosion during inflation operations. Miraculously, there were no casualities in either of these mishaps. Along this same line, the very dry air, the extreme amount of static electricity, and the practical impossibility of proper grounding precluded the use of most inhalation anesthetics. At Pole Station only local or regional anesthesia was available. Furthermore, the difficulties with grounding, compounded by the very dry air and high altitude which increased the frequency of component failures, made the work of the station's electronic personnel potentially lethal.

My Antarctic experiences pointed up to me vividly the preventive medicine attributes of good nutrition. A minimum of thirty-five hundred calories daily were supplied for each man. In addition, there seemed to be an excess of luxury items . . . steak, lobster, and king crab. These dietary treats did a great deal to maintain morale during the "long winter night." I feel certain that the accomplishments and general welfare of any small inland Antarctic station will be directly proportional to the cook's culinary abilities and his psychophysiological adjustment. In my opinion, he is the key man during an extended isolation situation of this type.

Fortunately, while I was the "life guard" there were no "saves" to be made. Perhaps we were lucky as the groups before us had been, but I doubt it. More likely the luck was the result of good preventive medicine and safety engineering.

The Bird Roost In The Woodmoor Section Of Baltimore County, Maryland

The histoplasmin skin test survey reported below in the result of interest generated by a bird roost in Baltimore County discovered during the fall of 1965. Dr. Scalia discusses the epidemiological study of this roost and the results of the survey.

A HISTOPLASMIN SKIN TEST SURVEY IN BALTIMORE COUNTY, MARYLAND

SAMUEL P. SCALIA, MD, FCCP
Director, Division of Tuberculosis, Baltimore County Department of Health, Towson, Maryland 21204

In the early fall of 1965, the Baltimore County Department of Health received many complaints relative to a bird roost in Woodmoor, a suburban neighborhood in the northwest section of Baltimore County. Several health department sanitarians inspected the bird roost and reported as follows:

The bird roost was part of a tract of land measuring approximately 5.8 acres. The northern 2.5 acres were dense with trees and underbrush and the birds roosted here. The flock of birds, estimated at 500,000, consisted of starlings, grackles and black birds. Bird droppings covered the ground and many tree branches to a depth of several inches. The birds had been roosting from late spring to fall for several years. There had been a marked increase in the number of birds in the summer of 1965, and this resulted in the complaints. The roost was surrounded on two adjacent sides by small private homes. At one end of the bird roost, across the street, there was the Woodlawn Junior High School. At the other end of the roost, there was the Woodmoor Elementary School. It was common knowledge in the neighborhood that school children often played in these woods or cut through them in going to and from each school. To compound the problem, the entire acreage had recently been sold for development and the developer was most anxious to clear the area completely and start his construction.

The sanitarians, while collecting soil samples, noticed that the air was filled with dust from the thousands of birds stirring about. Four soil samples pooled and studied at the Bureau of Laboratories of the Maryland State Department of Health cultured out Histoplasma capsulatum. A building permit was denied the developer and the area was posted with "No Trespassing" signs by the Department of Health.

Methods and Materials

In November, 1964, there had appeared an article in the *Antibiotic News* discussing the use of 3% formaldehyde for flushing a field infected with H. capsulatum.[1] A large bird roost in Mason City, Iowa had been associated with several fatal cases of histoplasmosis. The National Communicable Disease Center had conducted an extensive epidemiologic study and had followed up with the formaldehyde flushing. The Communicable Disease Center was contacted and Fred E. Tosh, MD, came to Baltimore to review the Woodmoor problem.

Forty-four surface soil samples were systematically collected from the area of the bird roost. In addition, a surface sample and depth samples at six and twelve inches were collected at three sites where the bird excreta was most heavily concentrated. It was decided to defer decontamination of the soil until the soil studies were completed. However, plans were made for a histoplasmin skin test survey to determine if the roost had been responsible for any infection among the school children in the two schools near the roost. For comparison studies, two similar schools at a distance away from the roost would also be involved in the histoplasmin program. With the advent of winter, it was agreed the bird roost hazard would be diminished so the histoplasmin project was planned for the spring of 1966.

In February, 1966, the 53 soil samples collected by Dr. Tosh were reported as negative on culture. The sub-culture of H. capsulatum from the Maryland State Laboratories was confirmed at the National Communicable Disease Center. The decision then was to continue with the histoplasmin skin test program in spite of the predominantly negative soils.

On March 9, 1966, Dr. Tosh and Robert Heusinkveld, MD, an associate from the Communicable Disease Center, in cooperation with the Baltimore County Department of Health, started histoplasmin skin testing.* Skin testing was performed on a voluntary basis with parental permission. The parents also had completed a questionnaire relative to the child's residences and possible relationships to farm life. The two schools selected for comparison were the Timonium Elementary School and the Ridgely Junior High School, located about ten miles northeast of the bird roost. The Board of Education of Baltimore County felt that these two schools were of similar socio-economic levels and best suited for comparison. The electric model jet gun was used for the actual testing and 2,695 children were tested at the four schools.

Geographic Location Of The Four Schools And The Bird Roost In Baltimore County, Maryland

Results

Of the 2,695 children tested, 72 had positive reactions for an overall reactivity rate of 2.7%. This is considerably lower than had been expected. Based on skin test surveys conducted elsewhere in the state of Maryland,[2,3,4] the reactivity rate was expected to be in the range of 25% to 40%. An attempt was made, therefore, to relate length of residence in Baltimore County to reactivity rate. Lifetime residents were defined as those having lived 80% or more of their lifetime in Baltimore County. By far, most of the children were lifetime residents, and this did not affect the reactivity rate, Table I.

Table II shows the results of the skin-testing program and compares the results of lifetime to non-lifetime residents at each of the four schools.

* The histoplasmin used was a 1:500 dilution of Lot HKC-5, prepared and standardized by the Kansas City Field Station of the National Communicable Disease Center.

TABLE I

Histoplasmin Sensitivity Among Children from Selected Schools in Baltimore County, Maryland

Length of Residence	Total Tested	Positive Reactors	
		Number	Percent
Lifetime	2114	52	2.5
Non-Lifetime	537	17	3.2
Unknown*	44	3	6.8
Total	2695	72	2.7

*Group of children who did not respond as to length of residence in Baltimore County.

TABLE II

Histoplasmin Sensitivity Among Children by School in Baltimore County, Maryland

School	Total Tested		Positive Reactors			
	Lifetime	Non-Lifetime	Lifetime		Non-Lifetime	
			Number	Percent	Number	Percent
Woodmoor Elem. Sch.	584	56	4	0.7	0	0
Woodlawn Jr. High	693	118	12	1.7	3	2.5
Timonium Elem. Sch.	358	143	7	2.0	4	2.8
Ridgely Jr. High	478	220	29	6.1	10	4.5
Unknown*	1	0	0	0	0	0
Total	2114	537	52	2.5	17	3.2

*One lifetime resident failed to indicate on the record the school attended.

It is immediately seen that histoplasmin sensitivity was lower among the students living near the bird roost than among those living ten miles away from the roost. As in studies elsewhere,[5] with an increase in age, there is an increase in reactivity rate, as seen by the higher rates among the older students in both junior high schools.

In Table III is summarized a history of residence on a farm in lifetime residents. Children having lived on a farm for a period of two or more years did, in fact, have a large percentage of positive reactors, but these were not enough to raise the overall reactivity rate. It is apparent that the population tested was mainly an urban one.

TABLE III

Histoplasmin Sensitivity by School and History of Residence on Farms* (Lifetime Residents Only)

School	Lived on Farm at Least 2 Yrs.			Never Lived on Farm		
	Tested	Positive Reactors		Tested	Positive Reactors	
		Number	Percent		Number	Percent
Woodmoor Elem. Sch.	1	0	0	571	4	0.7
Woodlawn Jr. High	7	0	0	668	12	1.8
Timonium Elem. Sch.	8	0	0	343	7	2.0
Ridgely Jr. High	50	4	8.0	407	24	5.9
Total	66	4	6.1	1989	47	2.4

*Does not include 59 children on whom such information was not available on records.

TABLE IV

Histoplasmin Sensitivity by Race and Sex* (Lifetime Residents Only)

	White			Non-White		
	Tested	Positive	Percent Positive	Tested	Positive	Percent Positive
Male	1060	24	2.3	11	2	18.2
Female	1025	25	2.4	9	1	11.1
Total	2085	49	2.3	20	3	15.0

*Does not include 9 children who did not report their race or sex on records.

Table IV summarizes histoplasmin sensitivity by race and sex among lifetime residents. It is interesting to note that sensitivity was much higher among non-white children than among white children. In view of Palmer and Edwards' studies[6] this was surprising, but the number of non-white children tested was small, so that this may not be a true reflection of histoplasmin prevalence.

Discussion

Emmons and Campbell[2] have shown that the isolation of H. capsulatum from the soil is perhaps the most conclusive evidence that infection in man and animals can be expected in a given area. The present study was initially undertaken because of such a finding. When the multiple soil samples collected by the Communicable Disease Center group proved negative for the fungus, it was decided to proceed with the skin-testing program to measure infectivity at the schools adjacent to the bird roost, and because such testing had never been performed on a large scale in Baltimore County. The finding of a very low reactivity rate proved that the bird roost was not a menace. The positive culture grown in the Bureau of Laboratories of the Maryland State Department of Health must have been a fortuitous finding.

Ajello[7] has implicated a variety of birds as being involved in histoplasmosis. However, he has shown that not all bird roosts are infected with the fungus, and conversely, he has isolated the fungus from areas without any apparent association with birds. He conjectures a relationship of the fungus to soil types, climate and biochemical activities of the micro-organism. The organism is not diffusely distributed in soils even in those regions classified as endemic. Campbell[8] reports low reactivity rates in regions of high endemicity, as in Kansas and Ohio, and high histoplasmin prevalence in certain areas of Maryland and Virginia, two states of low endemicity. Bats have also recently been implicated in histoplasmosis,[7,8] and bats are known to have a predilection for sites habited by birds. However, no bats were seen at the bird roost under study.

The presence of the fungus in the soil does not per se constitute a menace until the soil is disturbed and the spores are disseminated into the air. This has been seen in many epidemics, [9–14] in each of which the soil was disturbed by some undue activity such as farming, construction, clearing of underbrush or play activities of children. The bird roosts in most of these epidemics were long established and there had been heavy contamination of the soil. It is known that birds are not susceptible to histoplasmosis,[12] but that their excreta chemically fertilize the soil to activate the organisms. Probably very large accumulations of droppings over a prolonged period of time are required before this comes about. Residents could only guess that the bird roost under discussion had existed "for years."

Furcolow has presented many aspects of "urban histoplasmosis."[10,15,16] As cities spread further into suburban areas, this may become more of a problem. Since there is no means of protecting the individual by some sort of vaccination, public health control must depend on finding the organism and eradicating it from the focus. "Sanitizing the soil" infected with Histoplasma capsulatum has been difficult and expensive.[17] The chemical decontamination devised by Tosh and his group[18,19] sounds fairly easy and inexpensive, and studies to date seem to show it to be highly effective.

On the basis of the low histoplasmin reactivity rate and the sparse findings of H. capsulatum by the Maryland State Laboratory, decontamination of the site of the bird roost was not recommended to the developers. However, they were advised that during construction the area should be kept wet with water to prevent formation of dust and, thus, minimize airborne dissemination of spores. As a precautionary measure, they were also advised that laborers involved in the clearing and

excavating of the site should be histoplasmin positive. It was further recommended that if construction was delayed for a year or more, it would be wise to sample the soil again to make sure the fungus had not multiplied and become a true menace.

The owners of the acreage involved apparently have been reluctant to proceed with development and, as of this writing, the bird roost still stands. In 1966, no complaints were received by the Baltimore County Department of Health. In the spring of 1967, however, complaints came in. In cooperation with the United States Department of Interior, Bureau of Wildlife and Fisheries, the Division of Veterinary Medicine of the Maryland State Department of Health conducted a harassment campaign against the birds. This involved the use of carbide exploders, firecrackers and similar noise-makers to frighten the birds away. Although this campaign was fairly successful, the ultimate weapon in eliminating the birds as a nuisance is the destruction of the bird roost itself.

Summary

- A bird roost in the Woodmoor section of Baltimore County was found to be a possible source of histoplasmosis after soil samples studied by the Maryland State Laboratories cultured out Histoplasma capsulatum.
- Because of the proximity of two schools to the bird roost and because the acreage containing the bird roost was to be developed, the National Communicable Disease Center was contacted regarding this problem.
- Multiple soil samples collected by the CDC group were negative for H. capsulatum on culture.
- A histoplasmin skin test survey was conducted at the two schools adjacent to the bird roost and the findings were compared to two other distant schools similarly tested.
- The overall reactivity rate was much lower than had been expected and, in fact, the prevalence was even lower at the schools adjacent to the bird roost than at the more distant schools.
- The reactivity rate did not seem to be influenced by length of residence in Baltimore County.
- The population tested was mainly an urban one, so that residence on a farm did not enter as a factor.
- Based on the histoplasmin survey and the laboratory findings of the CDC group, it was concluded that the bird roost in question was not a menace and that the positive cultures found by the Maryland Laboratory were an accidental finding.
- The problem of Furcolow's "urban histoplasmosis" and decontamination of infected soil is discussed. Flushing the soil with 3% formaldehyde may be the answer to the problem.
- The histoplasmin skin test survey presented is the first ever to be conducted in Baltimore County.

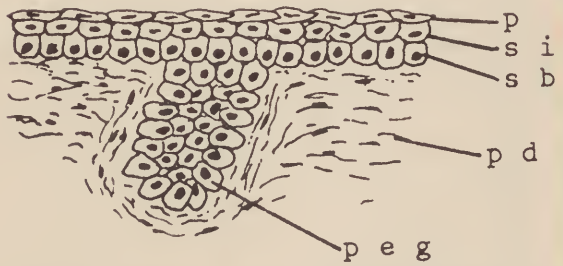
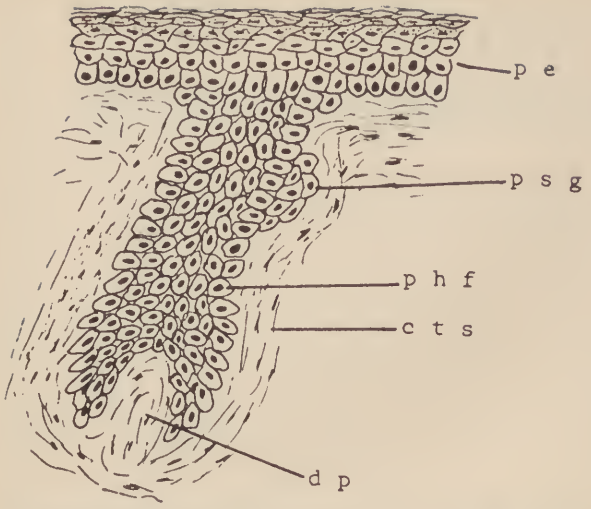
Krager, MD, Director of School Health Services and to the Board of Education of Baltimore County whose cooperation was instrumental in the conduct of this study. The author wishes to thank Donald J. Roop, MD, Deputy State and County Health Officer, for his editorial review and comments.



ALOPECIAS—DIAGNOSTIC AND PATHOGENETIC CONSIDERATIONS

DENNIS ALLEN WEIGAND, MD
Instructor in Dermatology
University of Oklahoma Medical Center
Oklahoma City, Oklahoma

Few problems concerning the skin and its appendages are of so much concern to patients and physicians as alopecia. Hair loss is of interest because, as far as we know, hair is essentially without function. It is of concern because hair is exceedingly important from a cosmetic and psychological standpoint. The fact that aesthetic considerations of alopecia prevail is clear in that people have traditionally sought the advice of hairdressers and barbers for problems of hair loss. Many people seem to consider the hair peculiarly unrelated to the rest of their anatomy and hence quite outside the realm of medicine. However, as people are becoming more medically sophisticated this pattern is changing, and medical advice is sought more freely.



Anatomy and Physiology

The surface of the human fetus, up to one month of age, is covered by a one-cell thick ectodermal layer, the fetal periderm. At this time also, mesenchymal cells are proliferating beneath to form the dermis, which is finally to become the main bulk of the skin. During the second fetal month a second, inner, layer, the stratum basale, is added to the periderm. During the third fetal month a third layer develops so that from the outside in, there are periderm, stratum intermedium, and stratum basale. From the stratum basale small buds of cells known as primary epithelial germs proliferate down at intervals into the dermis. These buds are the anlagen of apocrine sweat glands, sebaceous glands, and hair follicles. The greatest population of these is on the head, where their development begins. Subsequent development proceeds caudally during the fourth and fifth fetal months. As the presumptive hair follicles enlarge and differentiate, their free advancing ends become clavate and each encloses a little ball of dermis, the dermal papilla. This tiny structure will later house the main blood supply to the hair-producing cells (matrix) of the follicle.

Primitive epidermis of a 12-week embryo, p—periderm, si—stratum intermedium, sb—stratum basale, pd—primitive dermis, peg—primary epithelial germ.

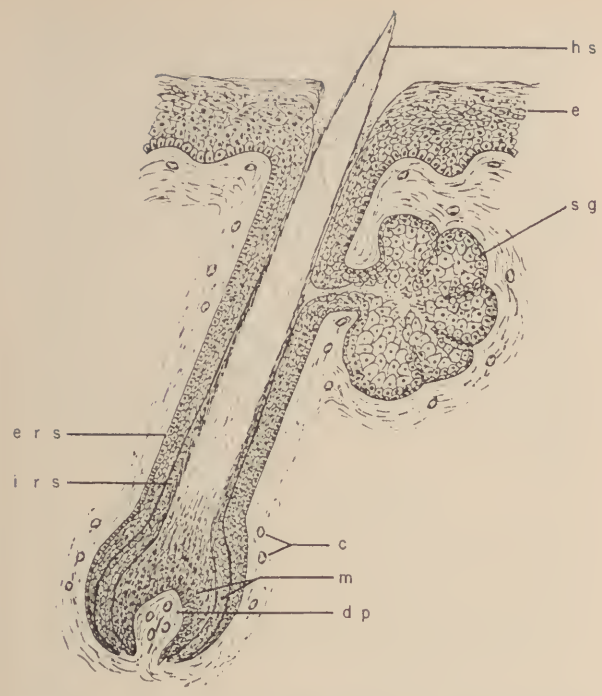
The presumptive follicle is now enlarged to a column of pluripotential epidermal cells. It progressively hollows out through the center to make way for the subsequent hair which will arise from a bulb of cells (matrix) surrounding the dermal papilla at the base of the follicle. At this time it is apparent that the major portion of the follicular wall, the external root sheath, is simply an extension of the now completely formed surface epidermis. At the fundus of this sac-like structure is a matrix of cells that produce hair, much like the surface epidermis produces stratum corneum. The main difference is that the latter desquamates and the former does not. There has been also a concomitant differentiation of part of the external root sheath into the sebaceous gland, so that this gland becomes an appendage in the wall of the hair follicle. In addition, further follicular blood sup-

Subsequent differentiation toward hair follicle and sebaceous gland, pe—primitive epidermis, psg—primitive sebaceous gland, phf—primitive hair follicle, cts—connective tissue sheath, dp—dermal papilla.

ply develops from surrounding dermal and subcutaneous vascular plexi.

The hair matrix has a high mitotic activity, comparable to that of the bone marrow. On the average adult scalp, which bears about 100,000 hairs, there is a daily production of 100 feet of hair. Hair, like the stratum corneum of the epidermis, consists mainly of keratin, a fibrous protein, and certain fats.

Fetal hair (lanugo hair) is present on the head by the fifth fetal month and subsequently appears over the remainder of the body. This hair, for the most part, is shed shortly before birth. (More on this phenomenon will be discussed later, as it relates to neonatal alopecia.) The newborn infant has a second pelage of lanugo-like (vellus) hair, of variable amounts. As he ages, he gradually acquires adult-type hairs. Morphologically adult hairs fall into six categories: (1) scalp, (2) eyebrow and eyelash, (3) beard, (4) body, (5) pubic, (6) axillary. Hormonally, adult hairs fall into three categories: (1) Non-hormonal (eyebrows and eyelashes, part of body hair), (2) hormone modified (scalp, axillary, lower pubic, part of body hair), (3) hormone dependent (upper pubic, beard).



The growth of hair is characterized by cycles. This is true in most mammals. However, unlike the hair of other mammals, human hair grows in asynchronous cycles, ie., it does not molt. Each individual hair's cycle is independent of all others, so that growth patterns are random. The growing phase (anagen), in which there is continuous matrix proliferation and hair production, usually last two to six years in scalp hair, and for shorter periods in other hair. The regressing phase (catagen) lasts only about two weeks in scalp hair, and for about the same period in other hair. During this time the matrix involutes, the hair stops growing and the lower 2/3 of the follicle degenerates. The blood vessels in the dermal papilla and around the follicle collapse but do not degenerate. The resting phase (telogen) lasts two to six months in scalp hair and in other hair. At this time the hair is loosely implanted in the follicle. A new anagen phase begins as the few remaining matrix cells begin proliferating anew to start a new hair. The previously collapsed vessels reopen and re-establish the blood supply. The old telogen hair ("club hair") is pushed out, and the follicle grows back to its original length for the new anagen phase.

These phases can be easily recognized by the gross appearance of individual scalp hairs. If a firmly implanted (anagen) hair is plucked, a sticky grayish-white membrane is seen around the lower 2-3 mm, or the hair root. This membrane is actually the major portion of the follicle and matrix. However, enough cells of these two structures have remained behind to allow full regeneration of a new hair. If a loosely implanted hair (telogen or club) is plucked, a tiny, dry, bulb is seen at the lower end, covered by a few degenerated follicular cells. These club hairs are ordinarily thin, tapered, and light in color when compared to anagen hairs. The catagen phase is so brief that hairs therefrom are seldom seen, but their appearance lies somewhere between that of anagen and telogen hairs.

Normally in the young adult, 85 to 95% of scalp hairs are in the anagen phase, and 5 to 15% are in the catagen and telogen phases. With age, and in certain types of hair loss to be discussed later, these percentages change. The normal young adult ordinarily looses 20 to 100 club hairs daily, for an average loss of about 50 daily.

Neonatal Alopecia

A commonly observed phenomenon in infants is occipital hair loss followed by fronto-parietal hair loss. This sometimes causes parental anxiety and the mother may stop cleaning the baby's scalp for fear of making him bald. A satisfactory physiological explanation for this hair loss exists, and its temporary nature can be assured.

Mature hair follicle in anagen phase, with sebaceous gland. hs—hair shaft, e—epidermis, sg—sebaceous gland; sebum is the product of disintegration of these cells. c—capillaries, m—matrix; these cells produce not only hair shaft, but also internal root sheath (irs), which degenerates and desquamates within the follicle. dp—dermal papilla. ers—external root sheath, a continuation of surface epidermis (e).

In the fifth fetal month the majority of the frontal and parietal hair suddenly goes into catagen and then telogen phase. This is, in a sense, molting, which is different from the random hair cycles of the postnatal individual, as pointed out previously. This gross change to catagen and telogen moves posteriorly in a wave, so that in the eighth fetal month it has occurred in the occiptal hair. At this time a new anagen growth has appeared frontoparietally and has pushed the telogen hairs out into the amniotic fluid about three months after their change to telogen. At birth then, the new anagen growth is occurring frontally and parietally. Subsequently occipital hairs will be pushed out when the infant is in his second month of life, about three months after their change to telogen. The new anagen hairs are still very short and the infant looks bald in the occipital area. This telogen wave is often repeated, although less extensively, so that the infant again develops partial baldness progressing from the frontal to the occipital regions. The follicles then ordinarily re-establish their cycles in a random pattern, and normal postnatal anagen and telogen percentages are established over the scalp. By the age of eight to ten months these regional losses ordinarily no longer occur. The only treatment necessary is reassurance that the condition is temporary.

Telogen Effluvium

Temporary hair loss following periods of physiological stress likewise is a well known phenomenon. Most physicians have seen patients who, two to four months after childbirth, major surgery, or serious systemic illness, have either sudden or gradual loss of large amounts of hair. This is known as *telogen effluvium,* because it represents the sudden change of a large number of hair follicles from anagen to telogen. Older names for this phenomenon include symptomatic alopecia and defluvium capillorum. Kligman has written extensively on this subject, and the studies indicate that over 20% telogen hairs on the scalp is presumptively abnormal, and that over 25% telogen hairs is diagnostic of telogen effluvium.

Post partum telogen effluvium usually begins two to four months after delivery, and lasts two to five months, although it may last a year or more. If a small tuft of hair is plucked, it will be seen that telogen hairs constitute somewhere between 20% and 50%. It should be emphasized that this is true only if the loose telogen hairs have not been removed in part by recent vigorous brushing or shampooing. Ordinarily they remain in place until pushed out by a new anagen hair. This accounts for the fact that the patient is more likely to complain about the amount of hair that falls out than about the amount remaining on the scalp. Furthermore, thinning of scalp hair is seldom obvious if less than 50% is lost.

Studies during pregnancy have shown that in most women, starting in the second trimester, telogen percentage decreases, and anagen percentage increases reciprocally. At term the scalp hair may be 95% anagen. This is virtually a biologic characteristic of pregnancy but usually it goes unobserved. Shortly after delivery this trend reverses, and by six to nine weeks post partum the telogen count is up to 25 to 30%. At this time new anagen hairs begin pushing the relative excess of telogen hairs out, and patients may become aware of excessive hair loss. It should be understood that change in telogen percentage in the individual patient is more important than absolute values, since there is a wide range in the actual number of telogen hairs and in the rapidity with which they

change to telogen. Hence the actual degree of thinning present at any given time is quite variable, if, indeed, it is even detectable.

Post-febrile alopecia, formerly seen quite often following scarlet fever, lobar pneumonia, etc., is uncommon now, but studies have shown that the process is essentially like that described for post partum telogen effluvium.

Information on which to postulate the pathogenesis of post partum telogen effluvium has been sketchy and inconclusive. A retrospective study of 98 cases by Schiff and Kern gave information suggesting a hormonal basis. In their series two patients developed alopecia after caesarean sections. Most patients observed the greatest involvement on the anterior one-third of the scalp. Most of the remainder had diffuse alopecia. In nearly all cases, hair loss had occurred after all previous deliveries or miscarriages. In those cases where it had not, subsequent conception had occurred before the second menstrual period. Determinations of urinary 17-ketosteroid excretion on 11 of these patients revealed no abnormalities. Likewise, urinary 17-ketosteroids, 17-hydroxycortocosteroids, and gonadotropins on another series of nine patients were normal. Studies of urinary estrogen and progesterone are lacking. Perhaps the hyperestrogenemia of pregnancy and the sudden termination thereof at delivery is pathogenetic. Bullough points out that estrogens exert a powerful mitotic effect on epidermis as well as on the uterus and vagina. Moreover, it is known that adrenalin is a powerful mitotic depressant. Its effect on epidermal cells has been confirmed in mice. Since telogen effluvium apparently can occur after severe psychologic stress and since it is known to occur after such physiological stresses as childbirth, major surgery, and severe illnesses, it could also be reasoned that adrenalin precipitates the change to telogen. However, Bullough further states that while these hormonal effects occur in epidermis, they have not been demonstrated in hair.

If hormonal changes do influence telogen effluvium, they do not do so exclusively. Heparin, in addition to being an antimitotic agent, is known to induce telogen effluvium. Herein lies evidence at least that a depression of mitosis and a consequent premature change from anagen to telogen may be the common denominator. Furthermore, like the usual types of telogen effluvium, heparin-induced alopecia affects mainly the scalp. This is readily explained by the fact that scalp hair normally has a higher anagen percentage than other hair and is therefore more susceptible to mitotic inhibitors. The observation that the administration of 300 mg of heparin daily for seven days will induce telogen effluvium in virtually all subjects observed tends to minimize the importance of individual variations in patients. The conversion to telogen in these patients occurs a few weeks to a month or more after the heparin is given. Telogen percentage may rise to over 50%, but, as in the postpartum situation, actual alopecia is not often manifest. Perivascular collagen degeneration has been seen in some histological studies, but the significance of this, if any, is unknown.

Idiopathic Alopecias

Alopecia Areata: Although it may be somewhat arbitary to designate this disease as "idiopathic," and those previously discussed as "physiologic," there is reason for doing so. Infantile alopecia and telogen effluvium can be demonstrated in most individuals under the proper circumstances, and the change in the hair is sufficiently predictable to give credence to the pathogenic mechanisms proposed. Such relationships are not readily established in alopecia areata. It is clearly a disease entity and not just a physiological phenomenon. A single cause has not been established, but histologic observations attest to its basic inflammatory nature.

Alopecia areata has been the topic of several good reviews, the most recent and extensive of which is from the Mayo Clinic. The incidence of this rather common disease has been about 2 to 2½% in the patients of large dermatology clinics. It is especially common among children and teenagers. It usually appears as one or a few bald patches on the scalp, although it may involve the whole scalp or even the whole body. Severe cases are more common in children. It is asymptomatic and the skin, except for the absence of hair, looks normal. The appearance of a depression in the involved areas is probably due to the loss of hair mass. In most cases regrowth occurs within a few months, although there is usually one or more relapses before regrowth is permanent. Individual areas often relapse or regrow independently of others. Initial extensive involvement, occurring in very young children, and involvement in sites other than the scalp all portend a poorer prognosis for eventual regrowth. Permanent regrowth after total scalp alopecia occurs in only 10% of adults and hardly ever in children. Regrowth typically

begins as pale vellus-type hairs that gradually assume the morphologic features of the surrounding hairs. In alopecia areata there are sometimes associated changes in other ectodermal structures. Pitting or brittleness of the nails occurs in 4 to 13%. Posterior subcapsular cataracts have been seen occasionally in adults. About 4% have vitiligo and about 8% have various thyroid gland disorders.

Most studies indicate a familial incidence of around 20%. However, rarely is the disease present in more than one relative. Also, considering the frequency of the disease, the significance of a 20% familial incidence is probably less than it might appear initially. Those who consider genetic factors of importance state that the pattern is probably autosomal dominant with variable penetrance.

Traditionally, emotional crises have been considered important at least in precipitating alopecia areata. Estimates of the degree of association between the two vary greatly. Studies of this alleged relationship are all too few and too limited in scope to be of much value.

Attempts to establish a hormonal basis for this disease have been generally unsuccessful. Relationship of the activity of the disease to pregnancy is unpredictable except in individual cases, where repeated remissions or exacerbations have occurred in repeated pregnancies. Apparently is has long been tempting to speculate on a thyroid dysfunctional cause. However, among the relatively frequent cases of thyroid disease are hypothyroidism, hyperthyroidism, endemic goiter, thyroiditis, etc., so that no thyroid hormonal pattern can be assumed. According to Rook, both hypothyroidism and hyperthyroidism tend to delay the onset of anagen phase and hence cause an increased telogen to anagen ratio.

Most sources of information on the histopathology of alopecia areata emphasize the following features: A chronic inflammatory reaction is seen around the lower one-third of the hair follicle, primarily around the bulb. The dermal papilla begins to lose the strong staining reaction for alkaline phosphatase, which is characteristic of normal anagen follicles. The follicle becomes smaller so that it lies progressively higher in the dermis. Eventually the whole structure is abortive and produces little or no hair. A thickened connective tissue sheath remains behind as evidence of what was once a normal anagen follicle. At this time the appearance is much like that of an ordinary telogen follicle except for inflammation around the bulb. The hair root is pointed rather than clubbed like a normal telogen hair.

Further observations of alopecia areata have revealed other similarities to telogen effluvium. Biopsies of the scalp at sites distant from lesions of alopecia areata, where the hair appears normal grossly, have revealed decreased normal anagen hairs, slight perivascular inflammation and areas of abortive follicles typical of alopecia areata. Similar but more pronounced changes, plus increased numbers of telogen follicles, have been seen in biopsies from the borders of alopecic lesions. Grossly these borders show thin, often broken hairs, that are narrowed at their insertion, resembling exclamation points. Thus alopecia areata seems to represent a combination of "telogen alopecia" and "dystrophic anagen alopecia."

Cormia and Ernyey have emphasized vascular occlusion as a possible pathogenetic factor. They feel that even though the inflammatory reaction seems to be the first recognizable event, vascular occlusive changes secondary to this may be the actual cause of the follicular shrinkage. They observe that in severe alopecia areata, ie., alopecia totalis, very little blood supply remains, especially around the bulb. Ikeda has also observed small artery occlusion followed by thrombus formation early in the course of alopecia areata. With the regrowth of hair, whether spontaneous or hastened by intralesional injection of a corticosteroid, the inflammatory infiltrate resolves, the blood supply increases and the follicle returns to a normal anagen appearance. Although this evidence favors some vascular occlusive process in alopecia areata, such changes are not peculiar to this disease. In fact, most types of alopecia show histologically some decrease in blood supply. However they do not appear to be directly related to an inflammatory infiltrate as they do in alopecia areata.

Intralesional injection of corticosteroids, preferably of the insoluble types, is the best treatment presently available for alopecia areata. It appears that this treatment probably does not alter the ultimate prognosis but simply hastens regrowth in those lesions where regrowth is due in the future. Unfortunately, intralesional steroid injection is sometimes attended by complications. The usual ones are not ordinarily serious. Subcutaneous injection sometimes produces a temporary subcutaneous fat atrophy. Intradermal injection sometimes causes dermal atrophy which may be

permanent. The most serious complication has been reported from France. Three young women whose anterior scalps were being injected for alopecia developed sudden blindness with head and eye pain. It was reasoned that forceful injection of a steroid particle suspension (Depo-Medrol® in two cases) entered a branch of the superficial temporal artery. From here there was retrograde flow into the anastomosing supraorbital branch of the ophthalmic artery and on into the ophthalmic artery, thence to the central retinal-artery where sudden occlusion occurred. Obviously injection into the scalp must be done carefully, despite the rarity of this complication.

Pseudopelade (Brocq, 1885): Discussions of this type of baldness are usually characterized more by disagreement than by elucidation. The disagreement stems from the question of its existence as a discreet entity. Contrary to the original description of the disease as a primary, atrophic, scarring alopecia, some have preferred to think of it is secondary to lichen planus or discoid lupus erythematosus or something else.

The usual characteristics of pseudopelade are a patchy and confluent, insidious, asymptomatic, atrophic and cicatricial alopecia, according to Laymon and Murphy's description. It is seen in adults, mostly women, and is progressive and irreversible. The alopecic areas are depressed and glossy with obliteration of follicular orifices. Most observers recognize a faint erythema at the borders. Sometimes the differentiation from alopecia areata (syn. *pelade*) is not so clear as the classical description of pseudopelade implies. Histologically there is inflammation in the upper portion of the hair follicle with eventual destruction and obliteration of the follicle.

Regarding the disagreement over the status of pseudopelade, it matters little whether Brocq's original cases represented truly a primary process or the residual of some inflammatory condition. The diagnosis is made entirely on *morphologic* grounds, and the scope of the diagnosis must be narrowed as *etiologic* information is gained about various alopecias that may produce what some have called the "pseudopeladic state." As causes are discovered these alopecias must be removed from the pseudopelade category.

Hereditary-Patterned Alopecia

This term refers to the very common frontal and occipital balding that begins at sexual maturity in men, and in women around the menopausal age, the so-called "diffuse female alopecia." In the male especially, the distribution of this alopecia differentiates it from others. There is progressive hair loss in the frontoparietal areas and, to a lesser degree, in the frontal area, and hair loss in an oval configuration at the crown. These areas often merge to produce the familiar marginal "horseshoe" of remaining hair.

It should be realized that there is normally a limited frontal and parietal recession of the hairline in nearly all persons after puberty. Although this is hormonally induced it is separate from true patterned alopecia.

Diffuse alopecia is the female counterpart of patterned alopecia in males. There is a less severe progressive hair loss in the vertex and frontoparietal areas, and this is usually first observed as an increased amount of hair clinging to the hair brush. This may be gradual or intermittent, and the hair may become less manageable. Some patients notice increased oiliness of the scalp. There may be vague symptoms of tingling, itching, or a crawling sensation of the scalp. In most cases there is no significant regrowth. In neither men nor women is there complete baldness. Close inspection always reveals considerable numbers of fine, short, pale vellus hairs on the apparently bald areas. Quacks often take advantage of the fact that patients do not notice these hairs, and point them out as evidence of hair growth after whatever treatment has been given.

There are three prerequisites for the development of hereditary-patterned alopecia in both males and females: (1) the presence of sufficient circulating levels of androgens, ie., sexual maturity, (2) the genetic predisposition (autosomal dominant, incomplete) to develop the condition, and (3) the age of late adolescence or older.

Eunuchs and hypogonadal females do not develop this alopecia because they lack testicular and ovarian androgens respectively. Apparently adrenal androgens are insufficient to induce the condition. With proper hormonal replacement therapy, and with the genetic predisposition, these people would develop alopecia. Since the inheritance is dominant, both heterozygotes and homozygotes are involved. It tends to be more severe in the latter.

Histologically there is progressive shrinkage of follicles and hairs in a random fashion. The conective tissue sheaths of follicles remain behind. The anagen period is shortened, resulting in shorter hair growth and more telogen hairs. Even-

tually only tiny vellus hairs are produced from miniature follicles, and many follicles have completely degenerated. The sebaceous glands remain, and are proportionally enlarged if not actually enlarged. There is a general reduction in blood supply to the scalp in patterned alopecia as there is with increased age normally. This has not been shown to be a causative factor.

Papa and Kligman were able to induce regrowth of perhaps 10 to 15% of terminal scalp hair in bald men of various ages by rubbing 1% testosterone propionate ointment on the scalp. Others have been unable to duplicate their results. The paradox is apparent here, that circulating androgen induced the baldness in the first place and topical androgen seemed to reverse it. Obviously the local effects on the hair follicle must be pharmacologic rather than physiologic. Testosterone propionate is apparently well absorbed percutaneously, and could theoretically at least cause pituitary inhibition. There has been considerable interest recently in the surgical treatment of hereditary-patterned baldness by the multiple-punch graft technique. The various aspects of this treatment have been discussed at length.

Studies on urinary androgen excretion in women with diffuse alopecia have not been impressive generally. However, one study has revealed significantly elevated urinary testosterone excretion in 30 women with diffuse alopecia when compared to control levels. Considerable attention has been given to possible thyroid dysfunction in women with diffuse alopecia. There is little evidence to support such a relationship and those allegations have been primarily on observations that some patients have seemed to improve while taking thyroid. It is well recognized that myxedematous persons tend to have sparse "coarse" hair and rough scaly skins. Careful studies of these observations are also lacking. The impression of coarseness is probably due to dryness. Thyroid hormone deficiency apparently does cause a slowing of mitoses in the skin with retention of stratum corneum and a decreased sebum production. The sparseness of the hair probably reflects decreased mitosis in the hair matrix and breakage of hair shafts.

Chapman and Main have reported diffuse thinning of scalp hair in two post-menopausal women who were hypothyroid from long-term iodide therapy for asthma. The patients became euthyroid and grew their hair again after discontinuing the iodides.

Traction Alopecia

This fairly common type of alopecia is seen principally in women and girls who repeatedly roll their hair tightly on brush rollers or who wear their hair in braids, pigtails or a bun. In each of these situations the hair in various places is subjected to long periods of firm traction. As a result, hair is either slowly pulled out or stretched or broken. Apparently no histologic studies are available to indicate whether the traction induces a premature telogen phase or inflammatory reaction, or whether the hair is simply pulled out and the remaining matrix cells continue to proliferate and produce a new hair.

The areas affected depend, of course, on the site of the greatest traction. With ponytails and buns the greatest traction is marginal, ie., along the temporal and retroauricular borders. With braids the midline of the scalp sagitally also is affected. Brush rollers induce alopecia in multiple patches, marginally, sagitally and at the frontal border. Close inspection reveals various degrees of hair loss in the various patterns, short tapered hairs of new anagen growth, and broken hairs. Occasional folliculitis may be seen but the scalp otherwise appears normal. If the trauma is discontinued regrowth usually is complete in three to four months, although scarring from folliculitis and severe trauma may cause some permanent loss.

Savill has observed that similar problems result from the use of hair brushes with sharp-edged bristles. Apparently vigorous and frequent brushing can cause fracturing, fraying and even extraction of hair. Brushes with natural rather than synthetic bristles are less likely to cause this.

Miscellaneous Traumatic Alopecias

Certain rare, sometimes familial, structural abnormalities of the hair, including *trichorrhexis nodosa* (intermittently splintered hair), *monilethrix* (beaded hair) and *pili torti* (twisted hair), are characterized by fragility and breakage of the hair of the scalp and other areas with minor trauma. These abnormalities are sometimes parts of congenital neuroectodermal syndromes, and have been linked with arginosuccinic aciduria, an abnormal urinary amino acid excretion pattern. However, recent studies have shown, in the case of trichorrhexis nodosa, that the urine is usually normal, the patient is healthy, and that the

splintering and fracturing are caused by trauma especially brushing, teasing, and scratching. In fact this abnormality can be produced in normal hair *in vitro* by subjecting it to artificially controlled manipulation of a specific type.

The problem of *trichotillomania* (pulling of hair by the patient) is not encountered frequently but is a difficult management problem. Patients are usually loathe to admit that they have pulled out or broken their hair as a result of some nervous habit or psychoneurosis. Indeed, they may not even be aware of it. The appearance is usually that of broken hairs and loss of hairs in one or more areas where the patient has continually pulled or twisted or curled the hair around a finger or scratched the scalp. The areas involved cannot be explained on the basis of brush rollers or other cosmetic procedures. The treatment is directed at convincing the patient of the nature of the difficulty, and sometimes the use of psychotherapeutic measures. The problem may be solved by having the patient wear a wig so the hair is not easily accessible.

Postoperative pressure alopecia has been listed as a distinct entity. Abel and Lewis reported eight cases in young and middle-aged women. These women had been on an operating table in the Trendelenburg position, for six hours or more in most cases, for gynecologic surgery. As a result of continuous pressure on the supraoccipital area there was rapid hairloss in this area from 3 to 28 days postoperatively. Most of the patients had been hypotensive for a time during surgery. Five of the eight had edema and exudation of the affected area within two days. Otherwise the patches resembled alopecia areata. Regrowth occurred in all cases within three months.

The histological findings were interesting. The outstanding change was an obliterative vasculitis of the middle and lower dermis, along with shrinkage and shortening of the hair follicle. A perivascular chronic inflammatory infiltrate was seen and in two cases panniculitis occurred. A similar alopecia has been observed over lumps in the scalp, in bruises, and in areas of furunculosis where scarring was minimal.

Post-Inflammatory Alopecias

Included in this category are those situations in which inflammation has been severe enough to cause destruction of the hair follicles and scarring. Some have been discussed already under other headings. However, one of these, alopecia mucinosa, is a unique entity with possibly serious implications and deserves special mention.

Alopecia mucinosa was described by Hermann Pinkus in 1957, from observations on six cases. These patients had one or more alopecic plaques on the head and extremities. The plaques were of slow onset and progress, yellow-brown, variably indurated, usually with patulous follicles and fine scale, and were asymptomatic. Children and adults of both sexes were involved. Histologically there was mucinous edema of the hair follicles and sebaceous glands until the whole pilosebaceous apparatus became an edematous bag. There was variable chronic inflammatory infiltration with secondary destruction of parts of the follicle. Pinkus believed the disease was basically inflammatory. However, Kim and Winkelmann state that the mucinous infiltration usually precedes the inflammatory reaction.

Five years later Pinkus discussed the followup of his original cases and compiled information on 63 additional cases from the literature. Some lesions appeared as groups of follicular papules. Some follicles were plugged rather than patulous, and contained stubby hairs. Still other lesions were moist and appeared eczematous. Hypesthesia was reported in some. Histochemical studies revealed increased amounts of glycogen in the follicles, and indicated that the mucinous material was acid mucopolysaccharide and mucoprotein. Most cases were self-limiting within a few months but in a few, an association with lymphoma was seen. Four of the patients either developed lymphomas or their alopecia mucinosa was secondary to pre-existing lymphomas. One-half of all the cases were under the age of 30, and one-third were in the 11 to 20 age group. Half had more than two lesions. In a later discussion, the clinical appearance has been divided into three categories: (1) like lichen spinulosis (groups of follicular papules with stubby hairs), (2) coalescent follicular papules with an eczematous surface, and (3) red boggy infiltrated plaques. The first type is the most common and most benign. The second and third types are seen in adults only, are more chronic, and have a denser inflammatory infiltrate. These types include those that are lymphomatous, which, according to Braun-Falco, always occur in patients over 40 years of age, and constitute less than 5% of all cases. In the cases reported by Kim and Winkelmann, some lesions changed from that of grouped follicular papules to plaques. Also, in

40% of their cases alopecia was not prominent. The scalp was involved in 25% of their cases.

Treatment with topical cortocosteroids or superficial X-ray have been effective in some cases. In those cases secondary to lymphoma, the treatment is that of the primary disease.

Alopecias Due to Mitotic Inhibitors

Almost any antimitotic drug, alkylating agent or otherwise, may cause alopecia if given in sufficient amounts. The worst offenders are vincristine, cyclophosphamide, and 5-fluorouracil. Since these drugs affect only actively dividing cells, the resulting alopecia can be called "anagen effluvium." However, local application of colchicine may induce a change to telogen phase. Smaller amounts of mitotic inhibitors will cause only a temporary suppression or cessation of mitosis. The result is a constriction in the hair shaft, of such length as to reflect the period of effect of the drug, but the hair cycle is not materially altered. Heparin-induced alopecia already has been discussed in the context of induction of the telogen phase. This drug is also a mitotic inhibitor and may cause alopecia in this way also. The coumadin compounds, heparinoids, paritol and dextran sulfate also cause alopecia. Apparently the mechanisms by which these compounds inhibit mitoses or induce telogen has not been elucidated.

An ingenious method has been devised by which alopecia from intravenous antimitotic drugs can be inhibited. A special sphygmomanometer cuff is placed on the head just below the scalp margins and is inflated to above systolic pressure. The blood supply of the scalp is thereby occluded during and for five minutes after intravenous administration of the drug.

Miscellaneous Alopecias

Several years ago a hypocholesterolemic agent, MER/29 (Triparanol®) enjoyed brief popularity. It soon became apparent, however, that a large percentage of the patients receiving this drug developed side effects, the most notable of which was ichthyosis. Subsequent to this some patients developed progressive diffuse alopecia of the scalp, eyebrows, and pubic hair. The process was reversible when the drug was discontinued. An analysis of the cases from the Mayo Clinic indicated that 250 mg of the drug daily would not cause alopecia but that 750-1000 mg daily nearly always did. The mechanism of this process was never elucidated. An antimitotic effect is unlikely because eyebrow and pubic hair grow quite slowly and are seldom affected by known mitotic inhibitors. A more likely explanation is defective keratin synthesis since the drug interferes with the synthesis of cholesterol, a significant component of keratin. The defect possibly was simply more obvious in the scalp, eyebrows, and pubis since hair is present in greatest density in these areas.

Another well-recognized cause of alopecia is thallium poisoning. Thallium acetate has been used in the past for epilation in treatment of ringworm of the scalp. However, it is not regularly effective in removing all the affected hairs; furthermore, its great toxicity makes it unsuitable for therapeutic use. In fact, its principal use now is as a rodenticide. Its toxic effects are cumulative and are similar to those of lead. It is slowly excreted in the urine and bile.

Ingestion of 7-8 mg/kg body weight causes anagen effluvium of an unphysiologic sort, with intrafollicular breakage of scalp hair and a high rate of conversion to catagen phase. With subsequent hair growth, as in other situations of excessive catagen and telogen conversion, a compensatory pause to reestablish non-synchronous cycles must be assumed.

An interesting phenomenon is the occurrence of patchy alopecia on a clinically normal appearing scalp in patients with cutaneous metastatic disease, especially from the breast. This has occurred with intraductal and scirrhous carcinomas and with ordinary adenocarcinoma. A resemblance to alopecia areata is apparent in early stages, but later the lesions tend to become red, nodular and indurated. Here it is possible that tumor cell infiltrates of blood and lymph vessels not yet clinically visible are of sufficient extent to compromise the blood supply of hair follicles, or perhaps to destroy their matrices.

Conclusion

The foregoing remarks for the most part have stressed the pathogenesis of various clinical types of alopecia. Notable is the great similarity of pathogenetic mechanisms among greatly dissimilar clinical patterns. The conclusion is that regardless of what pathophysiology causes the alopecia, the response mechanism of the hair follicle tends to be the same or similar.

Management and assessment of prognosis must still be based largely on clinical diagnosis.

A complete list of references will be supplied upon request.

A GAMUT OF "COLLAGENOSES"

The concept that the collagen diseases are variant symptom complexes of a basic immunologic disorder is being widely accepted. The case presented strongly supports this hypothesis by running the gamut from the mildest to the most severe manifestations of the "collagenoses."

L. R. SCHOOLMAN, MD
Braddock Heights, Maryland

The patient is a 29-year-old white married woman who was admitted to the hospital January 4, 1965 complaining of pain and tightness in the left chest, shortness of breath, fever, generalized aching, weakness and nausea which had become progressivley more severe for three days.

She was first observed in June, 1943 at age six. She was then living with her step-father who had active pulmonary tuberculosis, and her mother who had mild diabetes. The patient's tuberculin was 4+. In November, 1943, she had tonsillitis with a culture positive for beta hemolytic streptococci and in June of the following year, a T and A was performed.

In June, 1947, the patient developed acute hyperthyroidism. This was controlled by propylthiouracil for three years. During this period, diabetes mellitus appeared and was controlled by 25 units of PZI daily.

She grew normally and started menstruating at 14½ years. Insulin had to be increased to 75 units by 1954. In January, 1956, during her first year of college she developed erythema nodosum after which she frequently had morning stiffness of the knees. However, her corrected sedimentation rate remained under 20.

In November, 1957 she was married. The patient then weighed 120 pounds and was controlling her diabetes with 25 units of lente insulin.

She developed symptoms of Raynaud's disease of the fingers of both hands and aching and stiffness of the wrists and knees in October of 1959. During the latter part of December and early in January, 1960, she had swelling of the feet and hands. Her weight was down to 106. She was afebrile, had a normal blood picture and sedimentation rate, and negative latex and L.E. preparation. The A/G ratio was 3.6/3.4. The EKG was normal.

By June, 1960, Scleroderma of the forearms was obvious. The corrected sedimentation was now 25, and L.E. preparation negative. In July, the patient was treated in the hospital for a hypoglycemic convulsion. Three days later she developed a left facial paralysis which cleared spontaneously in one month.

Ulceration of the sclerodermatous right index finger developed in January, 1961, but healed after three months. By June, 1962, her weight had dropped to 86 pounds because of dysphagia. Thereafter, the sclerodermic G-I dysfunction subsided, her nutrition improved and by October, 1964 she weighed 105 pounds.

The physical examination showed an emaciated acutely ill young woman with butterfly flush over the malar regions and bridge of the nose. The skin of the lower arms and entire forearms and hands had the brawny and fixed character typical of

scleroderma. The fingers were almost completely ankylosed in a semi-fixed position. The lungs showed fine rales over both lower lobes. The heart sounds were clear and regular. The pulse was 110 and B-P 110/70. The ankles were swollen and showed a 2+ edema.

The urine showed 3- albumin, no sugar and 6-10 W.B.C. The hemoglobin was 10.1 gms, hematocrit 32, W.B.C. 10.100 with neutrophiles 85%, stabs 4%, and lymphocytes 11%. The F.B. glucose was 110 mgs%; S.U.N. 9 mgs%. The latex and L.E. preparations were positive. The A.G. ratio was 3.1/3.2. X-ray of the chest showed passive congestion and rather marked increased transverse diameter of the heart. The EKG showed low amplitude of QRS in the standard leads, measuring 3mm in I and 2mm in II, an ST segment elevation of concave configuration 1-2 mm in the standard leads and AVF and V5 and V6 and the R in V3 was 0.5mm in the presence of an R of 1mm in V2. The impression was possible pericarditis or non-specific myocardial changes.

The temperature peaked daily to 102 until intra-muscular dexamethasone was given. The fever then disappeared within 4 hours, and with it went all the other subjective symptoms. The rales also disappeared. Her appetite returned, and Prednisone was then given orally and was titrated to 30 mg per day. Insulin regulation was somewhat difficult because of the diabetes but was finally accomplished. She was discharged in 2 weeks with the diagnosis of acute lupus erythematosis, scleroderma, and diabetes mellitus.

The patient did well except for a bout of Herpes Zoster of the right 4th thoracic segment in June 1965. At last observation, October 1965, the patient weighed 106 pounds, was completely ambulatory, did her own housework, drove a car and played the piano. She was taking 15 mg of Prednisone and 80 units of lente insulin daily.

Tuffanelli and Winklemann reviewed 727 cases of systemic sclerosis seen at the Mayo Clinic between 1935 and 1958. They found 36 cases with both scleroderma and dermatomyositis, 31 cases of scleroderma and rheumatoid arthritis, 5 cases of scleroderma and lupus erythematosis, 7 cases of scleroderma and 2 of Sjögren's Syndrome.

They also reviewed literature concerning the presence of auto antibodies in the "collagenoses." Auto antibodies in lupus erythematosis is recognized everywhere and Damoshek calls it "an auto immune disease par excellence." Bardewil, through fluorescent antibody techniques, demonstrated the presence of a circulatory antibody in the gamma globulin fraction of 6 cases of scleroderma, 5 of lupus, 2 of dermatomyositis and 8 of rheumatoid arthritis which reacted with intranuclear nucleo proteins in autologous and homologous tissues.

The small Rheumatoid factor is another abnormal gamma globulin which has been found in many scleroderma patients, as it was in this case. Corcos, in 28 cases of scleroderma, found 7 with hypergammaglobulinemia, 13 with positive latex fixation tests, 6 with positive sheep cell tests, and 9 had fixed complement with calf thymus nuclei.

Hashimoto's thyroiditis was the first human disease proven to be caused by auto immune mechanisms. Becker, in reviewing the association of connective tissue diseases and symptoms with Hashimoto's disease, found a tenfold increase in the incidence of rheumatoid arthritis as compared to patients with granulomatous thyroiditis. There were also cases of scleroderma, Sjögren's disease and lupus erythematosis in the Hashimoto group.

Finally, there is a great deal of evidence to show that the so-called "collagen diseases" are not distinct entities but are variant or transitional forms of auto immune disturbances.

MEDICAL NEWS

From Baltimore . . . William Stewart, MD, recently appointed assistant professor at the University of Maryland School of Medicine, is helping to establish a new division of family practice which he hopes will revive the image of the family doctor making house calls—an image that has all but disappeared from the American scene.

"A survey taken three years ago," Dr. Stewart said, "indicated that more than 50% of freshman medical students wanted to become GP's. But," he added, "when they graduate, only 15% actually go into general practice.

"I believe the percentage drops because students are not exposed to general practice in medical school. How can they be expected to maintain their interest when they are taught only by specialists?

"The medical profession must remain responsive to the needs of the people, and the need today is for more doctors who can give total care. Many people use hospital emergency rooms as their family doctors, which is one reason for the crowded conditions of emergency rooms. The non-emergency patient often must wait hours before being seen. This is one of the problems we hope our family practice program will help solve."

Dr. Stewart

Dr. Stewart, the first full-time general practitioner appointed to the medical faculty, will begin the division next year on the graduate level with five residents participating in a three-year program. The residents will spend most of their time giving outpatient and ambulatory care in an adult center similar to the University of Maryland's Community Pediatric Center.

Outlining the duties of the residents, Dr. Stewart said, "Each resident will have a certain number of families in his care. He will make house calls, give yearly physical examinations to each member of the family, and evaluate home situations. By working with public health nurses, social workers, and others in the health field, the residents will be part of a team approach to medical care. We want to produce a physician who is family- and community-oriented rather than disease-oriented."

Maryland's School of Medicine is the tenth in the nation to initiate a division of family practice. At its annual meeting last fall in Dallas, the American Academy of General Practice voted to make family practice a board-certified medical specialty with a required re-examination by the specialty board for certified doctors every six years.

As vice president of the Maryland Academy of General Practice, Dr. Stewart stated that re-examination is vital. "The advances in medicine make it imperative for doctors to keep up-to-date. I believe the day is coming when all specialties will require recertification."

Dr. Stewart was awarded BA and MD degrees from The Johns Hopkins University and has been in practice in Westminster since 1952. He is a member of the Maryland State Board of Examiners and is chairman of the liaison committee of the state medical society.

Lincoln Gordon, PhD, was installed as ninth president of The Johns Hopkins University on February 22, 1968, at a formal ceremony coincident with the 92nd anniversary of the founding of the University.

A former Assistant Secretary of State of Inter-American Affairs, Dr. Gordon is a political economist and foreign affairs expert. He is a graduate of Harvard University where he was elected to Phi Beta Kappa and became a Rhodes Scholar. He received his doctorate from Oxford University in England.

In between his tenures at Harvard, where he

occupied a prestigious professorial chair, he served in Washington with various agencies during and after World War II and was a major participant in the formulation of the Marshall Plan for European Recovery and the Alliance for Progress with Latin America plan. Prior to his appointment with the State Department, Dr. Gordon served as Ambassador to Brazil.

In announcing Dr. Gordon's election, Charles S. Garland, Chairman of the University's Board of Trustees, said, "Dr. Gordon is an outstanding scholar of demonstrated accomplishment who himself has served as a senior professor at one of our most distinguished sister institutions; he is a superbly skilled administrator with a rich and varied background, so vital in running the affairs of a modern, complex university; and he is an articulate, dedicated man who has devoted his life to the service of mankind and the pursuit of knowledge."

Dr. Gordon

Dr. Gordon is author, co-author or editor of eight books. He has been a trustee of the World Peace Foundation, the Center for International Economic Growth and the Longy School of Music. He is a fellow of the American Academy of Arts and Sciences and a member of the American Economics Association, the Council on Foreign Relations, and the Royal Economic Society. He was granted the honorary degree of Doctor of Laws by Fairleigh-Dickinson University in 1965, Rutgers University and Columbia University in 1967.

The institution President Gordon is heading is one of the smallest of America's senior universities in terms of student enrollment, but one of the most complex in the scope of its activities. Undergraduate enrollment is 1,810; upper division students amount to 2,367 with more than 800 post-doctoral fellows.

With an annual budget in excess of $130 million, the university operates on five campuses—the Faculty of Arts and Sciences located at Homewood; the School of Medicine and the School of Hygiene and Public Health in East Baltimore; the School of Advanced International Studies in Washington, D. C., with its branch in Bologna, Italy; and the Applied Physics Laboratory in Howard County, a U. S. Navy contract research organization.

From Chicago . . . Karl Menninger, MD, founder and developer of the Menninger Clinic and Menninger Foundation, has been appointed the first Distinguished Professor of Psychiatry for the University of Health Sciences/The Chicago Medical School. In this capacity, Dr. Menninger will lecture and act in an advisory capacity in psychiatry at the institution.

The University of Health Sciences, a new approach to health care education, was officially launched on November 9, 1967, with The Chicago Medical School, a long-established medical teaching institution, as its base.

Commenting on the concept of this first university of health sciences, Dr. Menninger said, "It's a great idea and a great ideal and I am looking forward to being part of it."

Dr. Menninger is also senior consultant to the Stone-Brandel Center in Chicago, chairman of the Board of Trustees of the Menninger Foundation and dean of the Menninger School of Psychiatry in Topeka, Kansas. He serves as a consultant to the Veterans Administration, the U. S. Department of Justice—Prison Service, the U. S. Department of Health, Education and Welfare—vocational Rehabilitation, the Kansas Board of Social Welfare—Institutional Management, the Committee on the Rights of the Mentally Ill of the

Dr. Menninger (c.) is congratulated by Herman M. Finch (l.) chairman of the board of trustees, University Health Sciences/The Chicago Medical School, and University President, Walter S. Wiggins, MD.

American Bar Foundation, the Forbes Air Force Base Hospital, the Topeka State Hospital, the Topeka Veterans Administration Hospital, the Kansas Diagnostic and Reception Center, the Kansas Neurological Institute, and the Aspen Institute of Humanistic Studies in Colorado.

The world-renowned psychiatrist is a member of the Chicago Committee of the Chicago Council on Foreign Relations, the Family Study Commission of the Illinois Legislature, and the Cook County Sesquicentennial Committee of Illinois, and the Board of Directors, Chicago Boys Clubs.

In 1965, The American Psychiatric Association presented its first Distinguished Service Award to Dr. Menninger.

The National Easter Seal Society for Crippled Children and Adults has announced two scholarship programs for students in rehabilitation fields.

The programs are sponsored by two women's sororities, Alpha Chi Omega and Kappa Delta Phi.

The Alpha Chi Omega program of supplemental aid scholarships is a new project to assist students working toward master's degrees in speech pathology or audiology. Kappa Delta Phi scholarships are for students in their last year of training as physical or occupational therapists.

The Kappa Delta Phi Scholarships will range from $100 to $500. Applicants must be accepted in a certificate course or be in the senior year or the clinical training period of a degree course in occupational or physical therapy in a school approved by the Council on Medical Education and Hospitals of the American Medical Association.

Applications will be considered by a scholarship committee on the basis of scholastic achievement and financial need. Deadline for application is May 1, 1968.

The Alpha Chi Omega scholarships will be granted in amounts up to $750 toward a student's support during the course of a full academic year. The student must be recommended by the department head or a ranking faculty member of a master's degree program accredited by the American Speech and Hearing Association.

Deadline for application is July 15, 1968.

For more information, write to Scholarship Coordinator, Educational Service, National Easter Seal Society for Crippled Children and Adults, 2023 W. Ogden Ave., Chicago, Ill. 60612.

From Philadelphia . . . The American College of Physicians is anticipating the attendance of 5,000 specialists in internal medicine at its 49th Annual Session, April 1 to 5 in Boston.

The five days of scientific sessions will include 28 sessions with presentations of original papers covering advances in cardiovascular diseases, gastroenterology, pulmonary disease, endocrinology and metabolic disorders, rheumatology and immunology, infectious diseases and allergy, hematology, kidney diseases, neurology, psychiatry and cancer.

In addition, 14 panel discussions on major issues in clinical medicine will be held.

The annual session will also include a business session of the College, social events, including a concert by the Boston Symphony Orchestra and the President's reception and dinner dance. The session is being planned by Rudolph H. Kampmeier, MD, Nashville, Tenn., ACP President and Professor of Medicine Emeritus at Vanderbilt University School of Medicine, assisted by a local committee headed by Daniel S. Ellis, MD, of Boston, Assistant Clinical Professor of Medicine at Harvard University School of Medicine.

The Philadelphia Museum of Art is planning an international medical art center of prints and related illustrative medical material with an accompanying research reference center.

The complex, to be known as ARS MEDICA CENTER, was made possible through a major grant from the Smith Kline & French Foundation, the educational and scientific trust of SKF Laboratories, Philadelphia.

Development plans include the expansion of the Museum's outstanding collection of prints and drawings relating to the medical sciences, and the creation of a center for pictorial research in subjects pertaining to the history of medicine and allied professions. Through an informational retrieval system, both the original and some non-original visual material such as photographic archives, slides, etc. will be readily accessible for reference, study, exhibition, and loan.

Administration of the ARS MEDICA CENTER will be under the direction of Kneeland McNulty, Curator of the Department of Prints and Drawings.

The Heart Page

CHRIS PAPADOPOULOS, MD, EDITOR

A service of the Heart Association of Maryland

New Methods for the Prevention and Treatment of Ventricular Arrhythmias

Ventricular arrhythmias may cause serious disturbance of cardiac function and may result in death if not quickly terminated. In the past few years, reliable methods of terminating and preventing ventricular arrhythmias have been developed. These include external electric cardioversion, artificial pacing and the use of drugs including lidocaine (Xylocaine), diphenylhydantoin (Dilantin), and propranolol (Inderal).

J. O'NEAL HUMPHRIES, MD
Assistant Professor of Medicine
The Johns Hopkins University School of Medicine

Lidocaine

Lidocaine may be used subcutaneously as a local anesthesia, but when given intravenously it has a potent anti-arrhythmic effect. Its mechanism of action is very similar to that of quinidine or procaine amide; suppressing cardiac excitability. Like quinidine and procaine amide, lidocaine slows conduction, diminishes the force of contraction, and causes peripheral vasodilation. In large doses, it may cause excessive stimulation of the central nervous system and result in restlessness or even grand mal seizures. Lidocaine is not antigenically related to quinidine or procaine amide.

Lidocaine may be indicated for frequent premature ventricular contractions (PVC's), complicating an acute myocardial infarction or injury, for multifocal or pairs and triplets of PVC's occurring in a variety of situations, and for recurrent episodes of ventricular tachycardia. An initial dose of 100 mg of undiluted lidocaine should be given intravenously in three to five minutes followed by a maintenance dose of 100 mg per hour. This may be diluted in saline or in glucose and water and given as a slow intravenous drip. If the maintenance dose of 100 mg per hour successfully controls the ventricular irritability, attempts to progressively and slowly reduce the dose to 50 mg or less per hour should be made. If 100 mg per hour is not successful in suppressing the arrhythmia, the dose may be increased to 200 or even 300 mg per hour. If central nervous system irritation develops, the dose must be reduced and barbiturates administered. Lidocaine can be given continuously for days, or even weeks, if necessary.

In most circumstances, quinidine or procaine amide should be started orally as the dose of lidocaine is reduced and discontinued.

The very short duration of action of lidocaine when administered intravenously is in marked contrast to the duration of action of procaine amide or quinidine. It is this characteristic which makes lidocaine such a useful drug in the management of acute arrhythmias. The onset and peak action is almost immediate; it exerts its effect for three to six minutes and then the effect wanes

rapidly. The effect is dissipated in most persons in ten minutes and in everyone in 20 minutes.

Propranolol

Propranolol blocks the beta-adrenergic receptors in the heart and elsewhere in the body and thus reverses catecholamine effects; the sinus rate is reduced, conduction slowed, and excitability diminished. In large doses, propranolol appears to have a "quinidine-like" action of its own in addition to its beta-adrenergic blockade action. These actions are synergistic. Unfortunately, the blockade of the beta-adrenergic receptors significantly reduces myocardial contractility, and large doses of propranolol in the normal heart or therapeutic doses in the diseased heart may result in hypotension and heart failure. Also, bronchospasm may be markedly increased by the drug. Nevertheless, propranolol has been successfully used to treat and prevent ventricular irritable rhythms. It has been especially useful for the treatment of ventricular arrhythmias induced by digitalis. In an acute situation 0.5 to 1.0 mg should be given intravenously over ten to twenty seconds and may be repeated four or five times every three to five minutes. If the results are desirable, the drug may be continued by the intravenous route or may be given orally. Ten mg every six hours is the usual beginning oral dose. This can be increased gradually to 40 mg or more every six hours if indicated. The effect persists for four to eight hours after an intravenous or oral dose.

Propranolol has been useful where the suppressive agents, lidocaine, quinidine, or procaine amide have not been successful in controlling the recurrence of the ventricular irritable rhythms.

Diphenylhydantion

While diphenylhydantoin shares most of the cardiovascular actions of quinidine it does not slow conduction in the ventricle and thus is especially useful in the treatment of ventricular arrhythmias provoked by digitalis. One hundred mg may be given intravenously over a period of ten to twenty seconds, and may be repeated four or five times at five to ten-minute intervals if necessary. Doses larger than 500 mg have not proved effective and may be hazardous. If desirable effects result, diphenylhydantoin may be continued orally 100 mg three or four times a day.

Numerous instances of diphenylhydantoin causing severe and lethal slowing of the heart have been reported. This effect has usually occurred when large intravenous doses were being given rapidly. Therefore continuous observation of the heart rate and rhythm is mandatory when the drug is being given intravenously. Although diphenylhydantoin has been advocated in some instances of digitalis intoxication, the preferred management of digitalis intoxication continues to be the withdrawal of digitalis and when indicated the administration of potassium. Diphenylhydantoin should be given only when ominous ventricular arrhythmias are present.

Artificial Pacemakers

In the presence of complete heart block with a slow idioventricular rhythm or even in the presence of marked sinus bradycardia, the use of the suppressive and beta-adrenergic blocking agents to treat ventricular irritability may be hazardous. Ventricular arrhythmias occurring under these circumstances can be prevented by increasing the heart rate to physiologic ranges with an artificial pacer. Once reliable pacing is established, the suppressive and beta-adrenergic blocking agents can be used if necessary.

More recently, artificial pacing has been recommended to prevent ventricular arrhythmias even in the absence of bradycardia. An occasional patient with a normal heart rate and mechanism will continue to experience episodes of ventricular tachycardia despite the vigorous use of drugs but will cease to have these bouts if the heart rate is increased to 90—120 per minute with a pacemaker. In the absence of heart block, the pacing can be accomplished by placing a catheter electrode in the right atrium, but ventricular pacing from a catheter electrode in the apex of the right ventricle is usually more reliable. Temporary pacing may suffice for recurrent tachycardias resulting from drug toxicity or an acute myocardial infarction, but permanent pacing is needed in less well circumscribed situations. In either case, it is often necessary to continue to use suppressive and/or beta-adrenergic blocking agents in conjunction with the artificial pacemaker.

Baltimore City Health Department

Robert E. Farber, MD, MPH, Commissioner

New Medical Care Institutional Inspection Unit

The City Health Department has begun an intensive program to upgrade environmental conditions in those medical facilities in Baltimore City where patients on the Medical Assistance Program are provided services or care. These medical facilities include hospitals, nursing homes, clinical laboratories, blood banks and ambulances.

The new program established by the Medical Care Services of the City Health Department is being conducted under the supervision of the Bureau of Environmental Hygiene. Three sanitarians, Philip A. Berman, William N. Glenn and Lloyd H. Ross, have been appointed to the new Medical Care Institutional Inspection Unit. Their work will involve continuing inspections and surveillance of medical care facilities on a regular basis. In addition, they will investigate sanitary complaints concerned with these facilities and participate in other related activities.

The new Medical Care Institutional Inspection Unit will work closely with the Nursing Homes Division of Medical Care Services and the Director of Local Health Services.

Poison Control Ledger Report

According to reports compiled from accident rooms of 20 Baltimore hospitals and clinics, 3,761 persons were treated for accidental poisoning in 1967, the majority of whom were city residents. This report was made possible by the new poison report form which was supplied by the Baltimore City Health Department to those city medical facilities where accidental poisonings are treated. The total poisonings from this report does not include cases cared for by private physicians or treated with first aid at home. The record also shows that 21 Baltimore residents died of poisoning in 1967.

As in past years, most poisonings occurred to the pre-school child. A total of 2,073 children one to five years of age were treated for poisoning and one 26-months old child died of lead paint poisoning. By far the leading group of poisoning agents was internal medicines with 2,465 cases, and the leading medicine was aspirin. The next highest group of poisoning agents were household preparations such as soaps, detergents, polishes and cleaners with 404 cases.

A further analysis of reported internal medicine poisonings shows that of 600 cases involving drug abuse or accidental poisoning by barbiturates and sedatives, 336 were persons from 13 to 29 years of age. Further, a report from the State Medical Examiner's Office indicated that 11 of 24 poisoning deaths in Maryland in the 13 to 29 age group were caused by narcotics, sedatives, barbiturates and tranquilizers.

Publicity for poison prevention in the Baltimore area is now being formulated by a Poison Prevention Committee and will be evidenced during National Poison Prevention Week which began March 17. This committee comprises representatives of the Maryland State Department of Health, the Baltimore City Health Department, the Maryland Pharmaceutical Association, the Maryland Academy of Pediatrics, the Baltimore Safety Council and the Federal Food and Drug Administration.

Marvin C. Jones Appointed to Community Counseling Clinics

Mr. Marvin C. Jones, Clinical Psychologist, has been appointed Clinical Director of Community Counseling Clinics in the Baltimore City Health Department.

Mr. Jones, a graduate of The Johns Hopkins University, received his Master of Arts degree in 1963 from Wayne State University in Detroit and his Master of Public Health degree from The Johns Hopkins School of Hygiene and Public Health in 1967. A native of Detroit, Mr. Jones served his clinical psychology internship at the Veterans Administration Hospital at Dearborn, Michigan. From 1963 to 1966 he was employed as clinical psychologist for the Baltimore City Health Department's Alcoholism Clinic, a position he left to become staff psychologist for the Supreme Bench of Baltimore.

In his new post, Mr. Jones assumes direction of the City Health Department's mental hygiene clinics in the Eastern and Southeastern Health Districts. The two clinics provide psychiatric counseling services for emotionally disturbed young children and adolescents residing within the two health districts.

Paul F. Guerin, MD, Chairman
Library and History Committee

Elizabeth Sanford
Librarian

DR. LOUIS KRAUSE, LIBRARY COMMITTEE 1952-1968

For many years the Library and History Committee has been chaired by Louis Krause, MD, a truly dedicated scholar and physician. Each year when the committee convened for its first meeting, Dr. Krause endeavored to steer the chairmanship toward another member, but the unanimous decision was that he remain in that position. So it was with regret that the group accepted his resignation in the fall of 1967.

During his many terms of office Dr. Krause fought diligently for the establishment of an adequate Rare Book and History of Medicine Room for the library. Realizing that the Library Committee and administration did not realize what a valuable collection of rare volumes and memorabilia, as well as manuscript material was included in our stacks, Dr. Krause, upon the advice of Miss Gertrude Annan, Director of the New York Academy of Medicine, became interested in securing the services of an expert consultant to survey the library's book and journal collection. Mr. Lee Ash was chosen to make this appraisal and has now been working with the staff at intervals for several months.

Dr. Krause will always be associated with his efforts in behalf of the Medical and Chirurgical Faculty of Maryland Library.

Following his resignation, the committee elected Paul F. Guerin, MD, already a member of the Library Committee, as Chairman. Dr. Guerin, a pathologist, is also active in many other Faculty efforts and we look forward to working with him as Library and History Committee Chairman.

Annual Meeting Library Exhibit

During the sessions of the 1968 annual meeting the library will have a collection of newer books on display in the Blue Room of the Alcazar. Not only will members be invited to browse through, but may also charge out any titles they wish or reserve titles not included in the exhibit.

For assurance in finding the exact subject or title you wish, it is recommended you write the library and request these materials be brought to the exhibit booth and held there for your pick-up.

Forthcoming Meetings of Interest

The next meeting of the Baltimore Hospital Librarians' Association will be held at the Loch Raven Veterans' Administration Medical Library, Loch Raven Blvd., Baltimore, March 21. Mrs. Janet Koudelka, Assistant Librarian in charge of Rare Book and History of Medicine Departments, Welch Medical Library, will be the speaker. The subject of her talk will be "Special materials in hospital libraries." All hospital librarians in the area are invited to join this group. For information, contact Mrs. Norma Gross, President, at Church Home and Hospital, Broadway and Fairmount Avenues, Baltimore, Maryland.

* * *

The regional meeting of the Medical Library Association will be held in Richmond, Va., October 4, 1968.

* * *

During the meeting of the Delaware, Maryland and District of Columbia Hospital Association, the Baltimore Hospital Librarians Association will sponsor a panel on medical libraries on December 3, 1968.

Microforms Workshop

Special Libraries Association, Baltimore Chapter, will sponsor a workshop on microforms on March 27, 1968. Place: Kennedy Room, Hotel International, Friendship International Airport, Baltimore. Hours: 9:30 to 4:30 P.M. For information contact Mrs. Ruth McCullough, Westinghouse Defense and Space Center, Box 1693, Baltimore, Maryland 21203, or telephone 765-2858.

The muscle relaxant that works before you write a prescription

Relieve painful skeletal muscle spasm in your office in minutes with a single 2 cc. injection of NORFLEX. Then, for sustained relief, write a prescription for NORFLEX tablets, 1 tablet b.i.d.

CONTRAINDICATIONS: Due to its anticholinergic action, NORFLEX should not be used in patients with glaucoma, pyloric or duodenal obstruction, stenosing peptic ulcer, prostatic hypertrophy or obstruction at the bladder neck, cardiospasm (megaesophagus) and myasthenia gravis. Use with caution in patients with tachycardia. Do not use propoxyphene (Darvon®) concurrently.

WARNING: Transient lightheadedness or dizziness following NORFLEX-INJECTABLE may occur.

SIDE EFFECTS: Due mainly to anticholinergic action and usually at high dosage. They may include dryness of the mouth, tachycardia, palpitation, urinary hesitancy or retention, blurred vision, dilatation of the pupil, increased ocular tension, weakness, nausea, vomiting, headache, dizziness, constipation, and drowsiness. Infrequently, mental confusion in the elderly, urticaria or other dermatoses. Side effects are usually eliminated by reduction in dosage. Two cases of aplastic anemia, with no established causal relationship, have been reported.

DOSAGE: **INJECTABLE** — Average adult dose: one ampul, 2 cc. (60 mg. orphenadrine citrate) I.M. or I.V. May be repeated every 12 hours. Relief may be maintained with one NORFLEX tablet b.i.d. **TABLETS** — Two tablets per day for adults, one in the morning, one in the evening. Each tablet contains 100 mg. orphenadrine citrate.

For full information, see Package Insert or P.D.R.

Record 4,000 Films Lent in 1967

Drug abuse, sex education, venereal disease, and alcoholism were the chief topics covered in 4,000 loans of health education films during 1967. This is an all-time record for requests filled, and an increase of 100 over 1966.

Other popular film subjects were traffic safety, mental health, adolescents, maternal health, and nutrition.

Health Education films are summarized in "A Guide Book Describing Pamphlets, Posters and Films," recently issued in a revised third edition and available from the Division of Health Education.

HIGHLIGHTS

Intensive Anti-Smoking Campaign Conducted

The National Smoking Test, presented by CBS television network in January, was widely publicized throughout the State by distribution of well over one million test forms through schools and other channels, by a joint effort of the Department, the Maryland Division of the American Cancer Society, the Heart Association of Maryland, and the Maryland Tuberculosis Association. Distribution was aided by the Maryland Department of Education.

In a similar cooperative effort, 38,000 posters provided by the Public Health Service were sent to physicians, dentists, public and school libraries, and many industries and non-profit organizations. The message, "100,000 doctors have quit smoking cigarettes . . . (maybe they know something you don't") was based on research data supplied by National Opinion Research Center, University of Chicago.

Measles Mop-Up Continues

As a follow-through to the mass measles campaigns of spring, 1967, an in-school vaccination program was begun last September, the goal being the immunization of 60,000 children between 5 and 9 years of age, believed to be still susceptible to measles. This protection is expected to prevent any widespread outbreak of measles among younger siblings. On a one-county-at-a-time basis, it was anticipated that by the end of March, 39,000 children would have been immunized against measles.

Ten New PKU Cases Recorded in 1967

Between June and December, 1967, six confirmed cases of phenylketonuria were recorded in the Health Department's registry, bringing the year's total to ten. All infants were hospitalized for extensive diagnostic study. Since the Guthrie Screening Program was initiated in the State, 24 cases have been confirmed.

A new Guthrie collection form (BL50) has been developed for use by private physicians and health department clinics for collecting initial specimens. Initial blood tests performed on newborns in the hospital should continue to be collected on form BL49. However, repeat or follow-up tests by hospitals should be collected on the new BL50 form. All PKU specimens should be sent to the Bureau of Laboratories, 16 East 23rd Street, Baltimore, 21218. Supplies of both forms may be obtained from the above address.

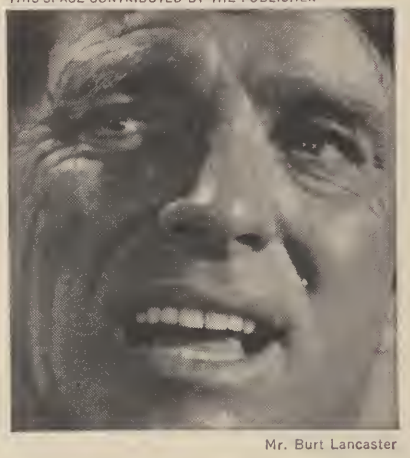
A 20-minute color film, "PKU," narrated by Dr. Emmett Holt, Professor of Pediatrics at New York University's School of Medicine, traces the medical history of the disorder and discusses its genetic aspects, with emphasis on the importance of early diagnosis and dietary management. It is available for loan from the Department's film library.

Payment Records Requested by Senate Finance Committee

Records of Medical Assistance payments to providers of service—hospitals, nursing homes, physicians, dentists, pharmacies, etc.—during fiscal year 1967 were recently furnished to Senate Finance Committee chairman Harry R. Hughes, and to House Ways and Means chairman William M. Houck, at their request.

Included with the record of physicians' payments were data explaining the figures in terms of numbers of office visits, home visits, laboratory and other services, drugs dispensed, Medicare deductibles and co-insurance paid, the numbers of recipients to whom these services had been provided, and the average cost to the State per patient per day for physicians' services. The highest amount paid to any physician for Medical Assistance patients reflected an average payment of $25.06 per patient over the year.

Report on Influenza Epidemic



The Surgeon General's prediction of an Asian flu outbreak in the eastern states was realized in Maryland in the second week in December when a Cumberland high school reported a sudden rise in absenteeism. Three days later on December 15th the health officer of St. Mary's County reported a similar high rate of local school absenteeism from a respiratory illness. The epidemic spread rapidly throughout the State and by mid-January all counties were affected. Although influenza is not a reportable disease the school absenteeism reports showed a high attack rate among teenagers. The severity of the disease is shown by the increase in deaths from influenza and pneumonia. The weekly total reached a peak of 63 during the week ending January 25, and for the period between December 15 and February 8, 308 deaths were reported as against an expected 173. From the point of view of deaths this outbreak was not as severe as the 1962-63 epidemic. By mid-February the prevalence showed a marked decline.

Virus isolations and serologic tests made in the Bureau of Laboratories confirmed the clinical diagnosis of A2 Asian influenza in specimens taken from cases in various parts of the State.

Hearings Held on Air Pollution Regulations

The State Board of Health and Mental Hygiene on two occasions recently conducted public hearings on the proposed new air pollution regulations prepared by the Department and recommended to the Board after review by the Air Quality Control Advisory Council. Members of industry, and representatives of various interested agencies, societies, and civic groups, including the Medical and Chirurgical Faculty, were given the opportunity to present testimony pro or con. The regulations were to be presented to the Board for adoption February 23.

Alcoholism Section

The Use of Disulfiram in the Treatment of Alcoholism

Disulfiram (Antabuse), in the proper dosage, is a safe and useful drug as an adjunct in the treatment of alcoholism. It acts by blocking the enzyme necessary for the breakdown of acetaldehyde, an intermediate by-product in the normal metabolic oxidation of alcohol.

MAXWELL N. WEISMAN, MD
Director of Alcoholism Programs and Community Psychiatric Services

Acetaldehyde accumulates in the body and may produce, after the patient swallows even as little as 15cc of alcohol, severe shocklike symptoms within 20 minutes. Flushing is experienced with severe tachycardia, palpitations, a pounding headache, rapid hyperventilation, chest pain and a sense of apprehension. After a few minutes, the blood pressure falls producing pallor and a feeling of weakness, dizziness and nausea. The patient may finally vomit and collapse completely. The reaction may last from two to four hours followed by sleep and a gradual return to normal. Severity of reaction varies with the individual and the amount of alcohol ingested.

Administration and Dosage

Before initiating therapy, *Abstinence From Alcohol for at Least 12 Hours is Necessary.* Adequate blood levels of disulfiram are not attained before at least four days of administration. Because excretion of the drug is slow, the symptoms of the alcohol-disulfiram reaction may be evoked as long as ten days after cessation of therapy.

Initial schedule is 0.5 gm (1 tablet) daily, either a.m. or h.s., for five days, followed by a maintenance regimen of 0.25 gm (½ tablet) daily thereafter.

It was originally thought advisable for each patient to have at least one supervised alcohol-drug reaction. Such a test-reaction has been largely abandoned and a clear, detailed and convincing description of the reaction is felt to be sufficient in most cases. Therapy may have to be continued on a daily basis for several months or years, depending on the individual. In certain situations, ingestion may be insured by administering the proper dosage crushed in orange juice.

The patient should be aware of the effects of the drug and take it voluntarily being warned against other medicines and foods containing alcohol. Cough medicines with less than 10% alcohol and foods containing only minute quantities such as wine-vinegar salad dressings or cooked foods in which the alcohol has been volatilized are quite safe.

Side Effects

There is an occasional skin rash (in 1% of cases) which is readily cleared by cutting the maintenance does to ¼ tablet (0.125 gm) or concomtant administration of an antihistamine. Certain individuals have noted a metallic or garlic-like aftertaste which disappears spontaneously with continuation of therapy or with the reduced dosage. Rarely is there drowsiness, in which case the

dose can be prescribed at night before bedtime. The dosage indicated above has produced no psychoses, impotence, or serious side-effects.

Contraindications

There are almost no contraindications, except as follows:

1. Unwillingness on the patient's part or without a full knowledge and understanding of the effects of simultaneous alcohol intake. It is, therefore, not wise to have someone else, such as a spouse, administer the medicine without the patient's consent and awareness.
2. During alcohol intoxication or after treatment with paraldehyde.
3. Frank psychosis or severe brain damage or mental retardation.
4. Heart failure.
5. Late stages of cirrhosis of the liver.
6. It is probably best not to give disulfiram in the early months of pregnancy though there is no evidence that it is harmful to the embryo.

Patients have been treated without ill-effects who have suffered from severe hypertension, coronary artery disease, diabetes, enlarged livers, tuberculosis, thyroid disease, and epilepsy. In such cases, however, the patients should be followed with great care.

Antidote

When reactions occur, the usual supportive measures to restore blood pressure and to treat shock should be instituted. Other suggested measures are oxygen by inhalation, carbogen (95% O_2 and 5% CO_2), intravenous doses of vitamin C (1.0 gm) ephedrine sulphate, or intravenous antihistamine. Potassium levels should be monitored, particularly when patients are on digitalis therapy since a fall in serum potassium concentration has been demonstrated during the drug-alcohol reaction. Corrective measures should be taken as required.

Comments

The disulfiram-alcohol reaction was first discovered in Denmark in 1948 and led to widespread, enthusiastic use of the drug in the treatment of alcoholism. The original suggested dose was three times that recommended at present and a number of fatalities were reported. The drug was then largely discontinued. When given, however, in the proper dose, as recommended above, disulfiram can be a most effective and safe deterrent to drinking.

It should be apparent, however, that disulfiram alone is not the complete answer as total therapy for so complex a behavior disorder as alcoholism. Its principal value lies in helping the patient maintain sobriety long enough to utilize other, perhaps deeper and more meaningful forms of therapy. It serves as an automatic brake on the impulse to drink and frees the patient from daily preoccupation with alcohol. Instead of having to make thousands of decisions each day not to drink, he makes only one—to take his medicine. The daily pill is both a symbolic and realistic commitment to total abstinence which, at the present stage of our knowledge of alcoholism, must be the goal of treatment.

A "Question and Answer" pamphlet about disulfiram for patient use is available in limited quantities from the Baltimore City Health Department Alcoholism Clinic, 2221 St. Paul Street, Baltimore, Maryland—21218.

Rehabilitation Notes

DOUGLAS G. CARROLL, MD, EDITOR

Vocational Rehabilitation

The Economics of Vocational Rehabilitation, a book by Ronald W. Conley (Johns Hopkins Press, Baltimore 1965) has a rather formidable and unpromising title. Nevertheless, it is one of the few attempts to evaluate the importance of vocational rehabilitation in a critical and objective manner.

Conley became interested in rehabilitation because of the difficulty that his family had in obtaining education and employment for his mentally retarded sister. Because of social apathy and prejudice, she was denied a chance to prove herself.

In the early chapters, the concept and definition of disability are developed. The magnitude of the problem of chronic disease and its effect on society are evaluated. Subsequently, the program of the Office of Vocational Rehabilitation in the United States is outlined and the results are evaluated from an economic point of view. Factors influencing successful vocational rehabilitation are discussed. In the final chapter, unmet vocational needs are described, and a plea for expansion of vocational rehabilitation services is made.

An interesting and very important conclusion of this study is that the amount of dollars spent on poor-risk rehabilitation clients is as important in economic return as money spent on the better vocational prospects.

Mr. Conley states "The benefits conferred upon society as a result of the vocational rehabilitation program would ideally be measured by comparing the levels of output, the amounts of housekeeping services, and the cost of special medical, nursing and custodial care for the disabled with what such costs would have been had rehabilitation not taken place."

Unfortunately, such an evaluation was impossible once the program was put into action. It would be unethical to compare a group of patients that was given rehabilitation with a group that was not given rehabilitation. Undoubtedly many patients referred to the Office of Vocational Rehabilitation would be able to find jobs for themselves without help.

It is difficult to judge the effect of vocational rehabilitation service on the overall economy of the nation. There can be little question that the successfully rehabilitated patient benefits from the services of the Office of Vocational Rehabilitation. Finding a job and becoming a productive citizen paying taxes takes the burden of supporting the disabled person off the community. These facts, however, do not prove that reemploying disabled persons is good for the overall national economy.

"In fiscal year 1960, for example, all but 2 or 3% were placed as housewives or on jobs that would otherwise have been filled by non-handicapped workers," Mr. Conley states.

In considering the effect of vocational rehabilitation on the total economy, therefore, one must consider how many normal workers are displaced by the rehabilitant. This effect would probably be different in times of high employment than in times of low employment. It is possible, however, that for every rehabilitant placed in a job some able-bodied person is unable to get that job and may well go onto unemployment or Welfare.

"Many of the costs and gains are difficult to measure or assess, and rehabilitation sometimes increases the welfare of one part of the society at the expense of another," states the author.

Another difficulty in evaluating vocational rehabilitation are the criteria of selection of patients

who will receive the benefits. Since successful rehabilitation is the purpose of the program, there must be a tendency to accent those patients who can be returned quickly to a job with only small investments of money. This group might well be the group which would be able to get jobs without any assistance whatsoever.

Despite difficulties of making a financial evaluation of vocational rehabilitation, it is still an important task because legislatures base their appropriations on such evidence. Ideally the evaluation should be made not only in economic terms, but also in terms of human values.

Need for Expansion

Conley's conclusions about the need for expansion of vocational rehabilitation efforts has recently been documented in Maryland by a report[1] released by the Bureau of Educational Research and Field Service of the University of Maryland. This report estimates that there are 63,000 disabled persons between 16 and 65 who remain unidentified and unserved by the Maryland Division of Vocational Rehabilitation. The report emphasizes two important facts. The first is that there is a high degree of disability resulting from circulatory diseases. Secondly, there are great needs for vocational rehabilitation amongst the poor.

A second recent Maryland report[2] surveys the services for vocational rehabilitation in Maryland. Deficiencies in personnel and facilities for vocational rehabilitation are identified.

Areas of Expansion

Vocational rehabilitation in the State of Maryland needs expansion in a number of directions if it is to be fully effective. There is need for more counselors, a large modern training center for the whole State, and for more support for other conventional programs now in existence.

In addition, efforts should be made to employ patients with more severe physical and psychological disabilities than those now being worked with. Sheltered workshops, protected employment and other methods of employing marginal workers should be expanded. Methods to allow welfare recipients to risk transient employment without losing their welfare status are necessary. Efforts to improve laws to remove some of the legal barriers making employers responsible for second injuries should be continued. *The concept of disability should be widened to include age and lack of education.* This should include training not only of high school drop-outs and people over 65 but also disabled housewives and other people whose goal may not be primarily vocational.

Summary

In brief, in addition to the conventional thrust of vocational rehabilitation, there must be an extension in the concept of disability with a lessening of emphasis on vocation and an increased emphasis on persons. Such an effort will require even closer integration and use of state, local and federal, hospital, welfare, educational, industrial, legislative, homemaking and retraining facilities.

*Includes 41 applications in miscellaneous categories—medical writing, plastic surgery, aerospace medicine and pharmaceutical medicine, for example.

When the rapidly approaching end of World War II loomed on the horizon in 1944, physicians on the home front foresaw the imperative need to establish an organized program to help their military counterparts return to civilian practice.

So, in December of that year, the House of Delegates of the American Medical Association established a Bureau of Information to "assist returning medical officers in their educational, licensure and placement problems."

Since the Bureau had been envisioned only as a temporary project, it was abolished in November, 1947, because it was logically assumed that its purpose—relocation of medical officers—had by then been largely accomplished. Its work was transferred to the Council on Medical Service until the "tapering off" process of service requests was completed.

But the requests never stopped. The war, directly or indirectly, had spurred profound changes. The wartime interruption of their medical practices gave medical officers an opportunity to think out their futures. It opened their eyes to new challenges and opportunities. Many physicians chose to capitalize on the chance to continue their medical education and enter specialty training.

Population patterns were changing. Some physicians took this as their cue to search for more attractive locations in which to practice. Others decided they wanted to seek out opportunities in entirely different geographic locations which held personal appeal for them. The unprecedented, uninterrupted period of post-war prosperity has served to multiply this mobility.

Consequently, the service originally performed

as a temporary expedient by the Bureau of Information not only never stopped, but has mushroomed into a major, continuing AMA service to physicians, those seeking physicians and to the nation at large.

Established as the successor unit to the Bureau in 1948, the AMA Physician's Placement Service has processed applications from 26,140 physicians seeking to be "placed," and registered 31,760 openings during its 18 years of existence. The service is provided without any charge or obligation.

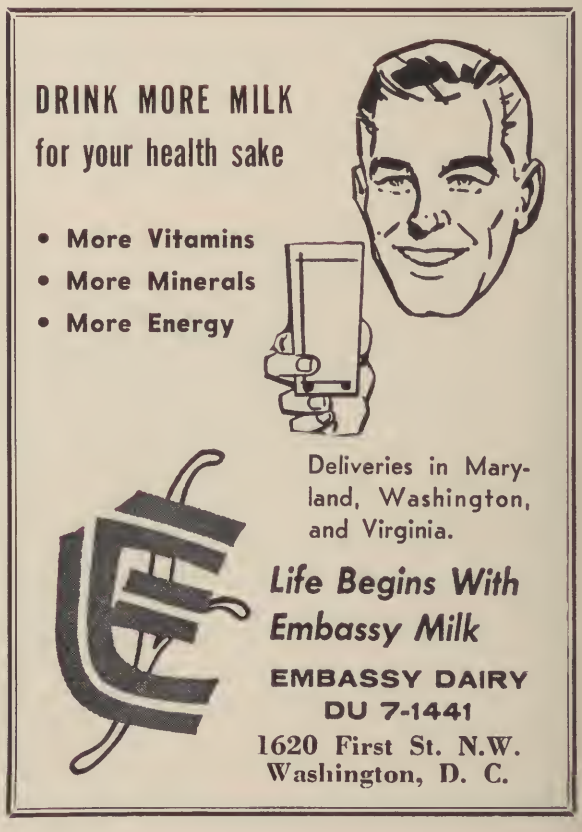
Indicative of the increasingly significant role being played by PPS on a national level is the fact that it had 3,196 openings registered and 2,750 physician registrants in 1966. Back in 1948 it had a mere 200 openings and three times that number of registrants.

The AMA Physicians' Placement Service works closely with all state medical societies, about two-thirds of whom have ongoing placement programs, and with those county medical societies who have such programs. It exchanges information with them on registrant applications and practice opportunities of mutual interest.

But its dominant role and chief reason for existence lie in bringing together physicians and opportunities which are in different states or geographic areas.

Strictly speaking, the AMA Physician's Placement Service is not a "placement" service at all. Its job is to supply information to applicants and those listing openings in an attempt to match their respective needs—to help find the "right" physician for the "right" location or position. Once brought together, two interested parties then seek to work out mutually satisfactory arrangements.

As a matter of fact, PPS can not even gauge with any reasonable degree of accuracy how many physicians it has helped to "place." While it is interested in knowing the answer, the information often is not made available since a good many registrants don't report their final status. The number of "placements" is, however, believed to be substantial.



A "bonus" effect of the service is that registrants pass along the word about openings to other physicians whom they think may be interested in a particular opportunity. Placements frequently result from these word-of-mouth contacts. Even more frequently, registrants are led to other opportunities they find more attractive as the result of PPS-originated contacts.

In January, for example, a former general practitioner who had gone on to complete his residency in anesthesiology reported that he had decided to accept a position in either Indianapolis or a city in northern Michigan. Although neither position was listed with PPS, he pointed out that he had learned of both opportunities through contacts it had produced.

Many openings are filled rapidly. Some, however, take considerable time.

A physician from Minot, North Dakota, for example, searched for nearly a year and a half, traveling considerably in the process, before he found the man having the very special qualifications required to work with him in a "loose association" arrangement. Needed was a cardiologist with extensive sub-specialty training in cardiopulmonary diseases. Available were outstanding new facilities for conducting work in this area.

Precisely filling the bill was a cardiologist who had just completed his military obligation. His background included five years of the subspecialty training required.

"I never dreamed I'd wind up in North Dakota," the new associate said. "It was the furthest place from my mind, but the opportunity—the new facilities, the nature of the practice and the arrangements—met my needs perfectly."

Although PPS is but one of several sources utilized in finding physicians, some employers have experienced their best "outside" results with the program.

Said the procurement director of a well-established Wisconsin clinic with several branch offices:

> "In 1966, 14 physicians signed contracts with us. Four of these were referred by the AMA Physicians' Placement Service. Your placement service was the only one of real value. We reached all the other new associates either through classified ads or personal contacts."

The emphasis of the Physicians' Placement Service activities is on private practice—solo, partnership, group, clinic or association—but it is becoming increasingly involved in other areas, exclusive of fulltime teaching and research positions where there are few openings and which are best handled by direct personal contact or by word of mouth. In 1966, there were 215 openings listed in industrial, institutional, public health or school or college health positions.

Occasional requests are received concerning practice opportunities outside the U. S., but such openings exist almost exclusively in underdeveloped countries—Africa, Asia and Latin America, for instance. Currently, about 90 such openings, including five in Viet Nam, are listed by governmental agencies, private and denominational missionary groups and industries.

While PPS lends assistance to physicians of all ages and interests, much of its activity centers upon those seeking their first place to practice. Last year more than 300 applicants made personal visits to the AMA headquarters to discuss opportunities to practice or physician manpower needs.

"Approximately 70% of physicians registering with us are looking for their first position," pointed out Mrs. Ann Johnson, director of the service. "They're either just completing internship or residency training or completing military service.

Under a brand new program initiated by mid-year of 1967, the Physicians' Placement Service began to concentrate upon finding places to practice—full- or part-time—for physicians who had not recently been engaged in active practice. This includes older physicians who have been retired, women physicians who temporarily have abandoned medical practice and physicians who have been engaged in other areas of work.

The mechanics of the Physicians' Placement Service are relatively simple. Each applicant is asked to fill out a brief questionnaire, on which he is to list his background, education, training, personal history and references, the type of position sought and the state or geographical area preferred.

A similar form is completed by those listing opportunities to practice. This contains such pertinent information as the type of community, type of specialty training required, type of practice, any age and special requirements, financial arrangements, whether there is an opportunity for partnership, available hospital facilities, type of schools available and what type of office space is available.

Each applicant is asked whether he wants a position in his home state only, in different states in the immediate home region, in the home or a

new region, in a new region only or has no preference. Geographic regions are divided into six categories—New England and Middle Atlantic, South, Midwest, Southwest, Mountain States or Pacific States.

Let's assume, for instance, that you are an internist in solo practice in Chicago, but would like to enter group practice in one of the Mountain States because you and your family enjoy the climate, are avid outdoor enthusiasts and feel that you would prefer a more relaxed way of life that you are likely to find in this geographic area. You desire a location in a city of 25,000-100,000 population and specify that it must have a church of your faith. You also specify what compensation you expect to receive.

In filling out your application, you find that PPS will circulate your resumé on a blind basis since you prefer to remain unidentified. Unless you have specified otherwise, a copy of your coded application will automatically be sent to each of the state medical association placement services in this geographic region.

Shortly thereafter, you will receive from PPS a list of all current openings for internists. You also will be advised that PPS will forward a copy of your coded resumé to all individuals, groups and communities having openings meeting your specifications.

PPS then will forward to you any letters from interested parties. If the position interests you, it is up to you to follow up by initiating contact. PPS has then fulfilled its role as intermediary by supplying both interested parties with information. It will, however, continue to send you descriptions of new openings until you advise that you have either accepted a position or are no longer interested in relocating.

In addition to the placement service, PPS also helps the practicing physician by providing carefully researched information serving as a guide in planning physicians' medical facilities and managing medical practice. It also provides communities with information about the Community Medical Assistance Program for rural communities, a plan carried out cooperatively by the AMA and Sears-Roebuck Foundation.

If you ever consider relocating or entering a different type of practice, are looking for a prospective partner, associate or an additional physician for your community, or are thinking about building new office facilities or modernizing present ones, you'll certainly find it advantageous to find what the AMA Physicians' Placement Service has to offer. And if you hear of someone who is "looking," you may do him a big favor by referring him to PPS.

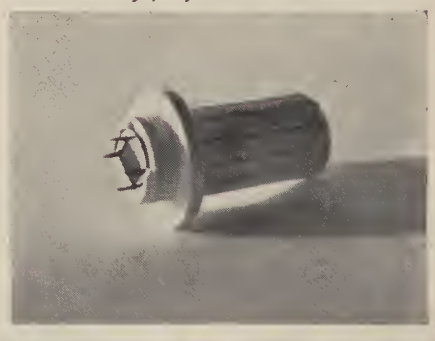
PUBLICATIONS LIST

To obtain free copies of any of the following publications describing various services provided by the PPS, write to Physicians' Placement Service, American Medical Association, 535 North Dearborn Street, Chicago, Illinois 60610.

FINDING A PLACE TO PRACTICE (an eight-page pamphlet describing the Physicians' Placement Service and outlining sources and factors to be considered in choosing a place to practice or relocate)

THE BUSINESS SIDE OF MEDICAL PRACTICE (a 56-page brochure containing detailed information covering the business aspects of conducting medical practice)

A PLANNING GUIDE FOR PHYSICIANS' MEDICAL FACILITIES (a 54-page brochure containing valuable guides for established physicians seeking to build or modernize medical facilities)



THE SEARS-ROEBUCK FOUNDATION MEDICAL CENTER (a four-page pamphlet describing architectural plans for a rural medical building and the Community Medical Assistance Program)

WHAT DO YOU KNOW ABOUT PHYSICIANS' PLACEMENT SERVICE? (a four-page pamphlet)

A DOCTOR FOR YOUR COMMUNITY (a 19-page pamphlet providing guidelines for communities to follow when undertaking to procure a physician)

To fight TB-find it first!

Make tuberculin testing routine with every physical examination.

TUBERCULIN,TINE TEST (Rosenthal)

Side effects are possible but rare: vesiculation, ulceration, or necrosis at test site. Contraindications: none, but use with caution in active tuberculosis. Available in 5's and 25's.

Lederle

330-8/6135

let's be specific about Campbell's Soups... and *reducing diets*

There are more than 30 million people in America who are overweight. During the next year, you probably will see more than 1,000 of them in your own practice.

One good way to help these patients is to give them a reducing diet based on ordinary eating patterns.

Campbell has prepared a sensible plan for weight control based on ordinary eating patterns. The plan consists of a patient instruction booklet and a set of menus which provide approximately 1,200 calories daily. The menus are balanced to provide the minimum daily requirements of nutrients.

To obtain a supply for your office write to:
Campbell Soup Company, Box 265, Camden, N. J. 08101

Conventional Radiography
The restless duodenum makes radiographic diagnosis difficult, uncertain and often unproductive: Is this duodenum abnormal?

Hypotonic Duodenography
Pro-Banthīne-induced duodenal calm permits full anatomic appraisal: Same patient. Duodenal normality is now evident.

• in diagnosis

• in treatment

Pro-Banthine® brand of propantheline bromide

calms the gastrointestinal tract

For fifteen years Pro-Banthine has been the most widely used anticholinergic agent in disorders of gastrointestinal motility and gastric hypersecretion. More recently Pro-Banthine has reestablished its pharmacologic effectiveness in diagnostic procedures using intragastric fibroscopy and hypotonic roentgenography.

How the X-rays were taken

In the hypotonic duodenograph[1,2] reproduced above, the gastrointestinal tract was relaxed with Pro-Banthine. The duodenum was intubated. Pro-Banthine in a dose of 60 mg. intramuscularly was used to assure prompt aperistalsis and double-contrast visualization was achieved with ordinary barium and air.

The same pharmacologic efficiency has proved of pronounced value in such conditions as: *peptic ulcer, pylorospasm, biliary dyskinesia, functional hypermotility and irritable colon.*

Contraindications: Glaucoma or severe cardiac disease.

Precautions: Since varying degrees of urinary hesitancy may occur in elderly males with prostatic hypertrophy, this should be watched for in such patients until they have gained some experience with the drug. Although never reported, theoretically a curare-like action may occur with possible loss of voluntary muscle control. Such patients should receive prompt and continuing artificial respiration until the drug effect has been exhausted.

Side Effects: The more common side effects, in order of incidence, are xerostomia, mydriasis, hesitancy of urination and gastric fullness.

Dosage: The maximal tolerated dosage is usually the most effective. For most *adult* patients this will be four to six 15-mg. tablets daily in divided doses. In severe conditions as many as two tablets four to six times daily may be required. Pro-Banthine (brand of propantheline bromide) is supplied as tablets of 15 mg., as prolonged-acting tablets of 30 mg. and, for parenteral use, as serum-type vials of 30 mg. The parenteral dose should be adjusted to the patient's requirement and may be up to 30 mg. or more every six hours, intramuscularly or intravenously.

He's had enough excitement for one day.

For the patient who has been through an accident, the worry and anxiety following the experience may actually heighten the perception of pain. This is why there's a classic 1/4 grain *sedative* dose of phenobarbital in Phenaphen with Codeine—*to take the nervous "edge" off,* so the rest of the formula can control the pain more effectively.

Phenaphen® with Codeine

Phenaphen® with Codeine No. 2, No. 3, or No. 4 contains: *Phenobarbital* (1/4 gr.), 16.2 mg. (Warning: may be habit forming); Aspirin (2 1/2 gr.), 162.0 mg.; Phenacetin (3 gr.), 194.0 mg.; Hyoscyamine sulfate, 0.031 mg.; Codeine Phosphate, 1/4 gr. (No. 2), 1/2 gr. (No. 3), or 1 gr. (No. 4). (Warning: may be habit forming).

THE COMPOUND ANALGESIC THAT CALMS INSTEAD OF CAFFEINATES

Indications: Phenaphen with Codeine provides relief in severer grades of pain, on low codeine dosage, with minimal possibility of side effects. Its use frequently makes unnecessary the use of addicting narcotics. **Contraindications:** Hypersensitivity to any of the components. **Precautions:** As with all phenacetin-containing products excessive or prolonged use should be avoided. **Side effects:** Side effects are uncommon, although nausea, constipation and drowsiness may occur. **Dosage:** 1 or 2 capsules at 2 to 4 hour intervals, or as directed by physician. For further details see product literature.

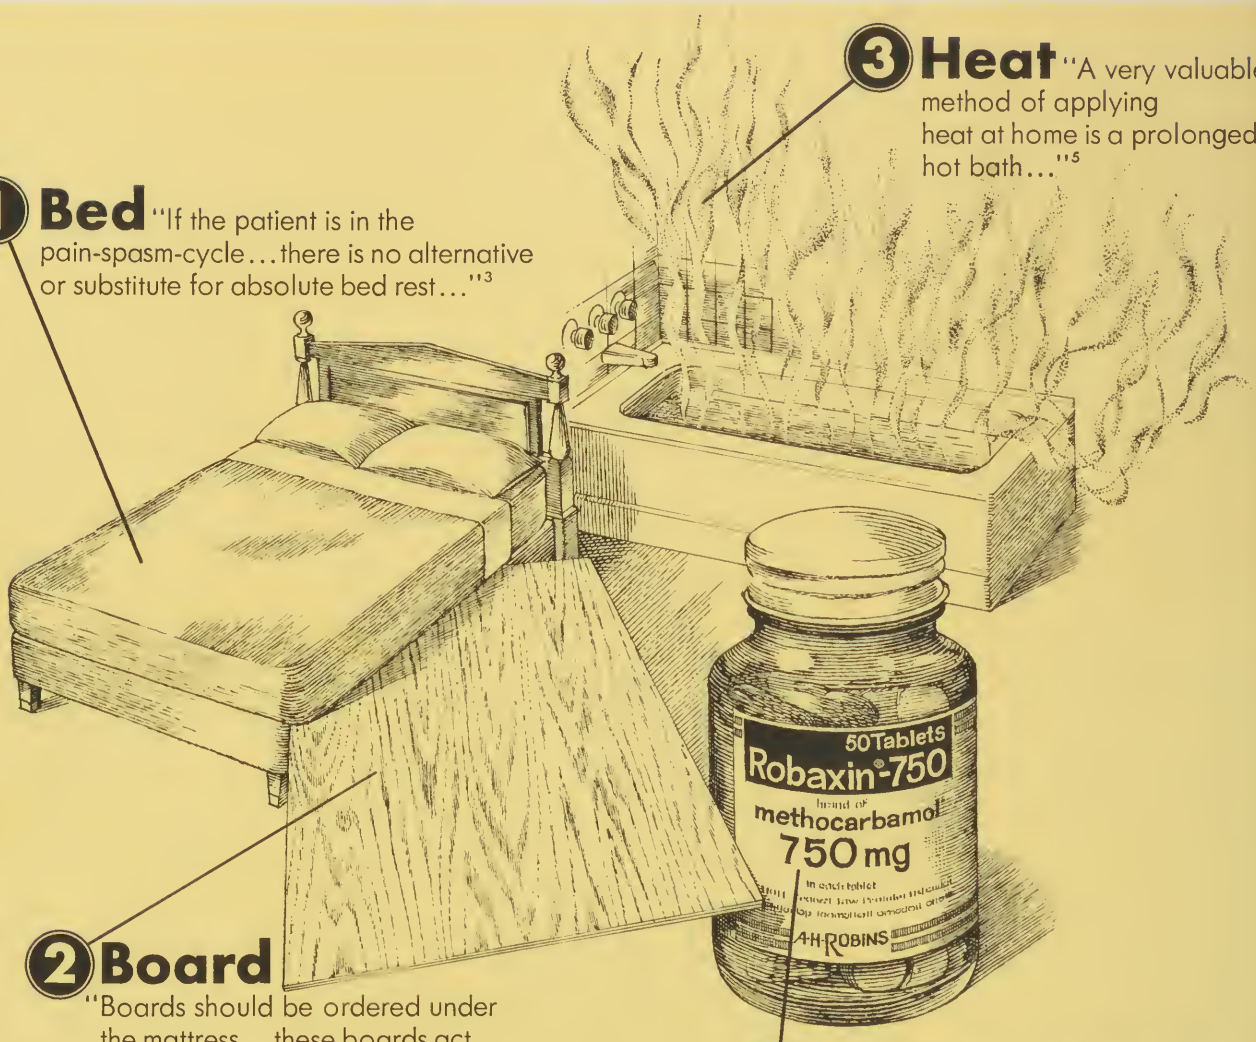
RICHMOND, VA. 23220 A·H·ROBINS

LOW-BACK PAIN



A CONSERVATIVE, FOUR-POINT PROGRAM

The low back pain that is most frequently seen in general practice is mechanical in nature, i.e., postural back pain, joint dysfunction and acute back strain.[1,2] For this type of discomfort, a conservative regimen is usually sufficient to relieve aches and pains, and to help keep the patient functioning. Components of this basic program include:

1 Bed "If the patient is in the pain-spasm-cycle...there is no alternative or substitute for absolute bed rest..."[3]

2 Board "Boards should be ordered under the mattress...these boards act by immobilizing the spine..."[4]

3 Heat "A very valuable method of applying heat at home is a prolonged hot bath..."[5]

4 Robaxin®-750 (methocarbamol, 750 mg. capsule-shaped tablets) A well-tolerated[6] skeletal muscle relaxant, methocarbamol helps relieve spasm "...without interfering with normal tone and movement."[7] And there is little likelihood of sedation.[6]

Indicated for relief of skeletal muscle spasm. **Contraindicated** in hypersensitive patients. **Side Effects** (lightheadedness, dizziness, drowsiness, nausea) may occur rarely, but usually disappear on reduced dosage. Hypersensitivity reactions develop infrequently. See product literature for further details. **Also available:** Robaxin® Tablets (methocarbamol, 500 mg.) Robaxin Injectable (methocarbamol, 1 Gm./10 cc.)

A·H·ROBINS A. H. ROBINS COMPANY RICHMOND, VIRGINIA 23220

Help clear up that miserable stuffed-up feeling with Dimetapp. Each hard-working Extentab brings welcome relief from the stuffiness, drip and congestion of upper respiratory conditions for up to 10-12 hours. Yet, patients seldom experience drowsiness or overstimulation. The key to success is the Dimetapp formula: Dimetane (brompheniramine maleate)—along with phenylephrine and phenylpropanolamine, two time-tested decongestants. They get the job done... in a hurry.

Indications: Dimetapp is indicated for symptomatic relief of the allergic manifestations of respiratory illnesses, such as the common cold and bronchial asthma, seasonal allergies, sinusitis, rhinitis, conjunctivitis, and otitis.
Contraindications: Hypersensitivity to antihistamines. Not recommended for use during pregnancy.
Precautions: Until patient's response has been determined, he should be cautioned against engaging in operations requiring alertness. Administer with care to patients with cardiac or peripheral vascular diseases or hypertension.
Side Effects: Hypersensitivity reactions including skin rashes, urticaria, hypotension and thrombocytopenia, have been reported on rare occasions. Drowsiness, lassitude, nausea, giddiness, dryness of the mouth, mydriasis, increased irritability or excitement may be encountered.
Dosage: 1 Extentab morning and evening.
Supplied: Bottles of 100 and 500.

up to 10-12 hours clear breathing on one tablet

If hypothyroidism leaves your patient feeling like this...

consider

LETTER®

(SODIUM LEVOTHYROXINE, ARMOUR) TABLETS

Synthetic Thyroid Replacement Therapy

Letter® provides all the advantages of the synthetically pure chemical sodium levothyroxine. Dosage is precise and potency is consistently uniform.

and

Letter® is micronized to provide maximum opportunity for full absorption and clinical response.

In addition Letter® is distinctively color coded with an identifying number stamped on each tablet to provide accurate dosage control.

Indications: Hypothyroid conditions. **Contraindications:** Thyrotoxicosis, acute myocardial infarctions unless associated with hypothyroidism. In hypothyroidism with hypoadrenalism coadministration of corticoids with LETTER® is recommended. **Precautions and Side Effects:** Excessive dosage may result in diarrhea, cramps, palpitation, nervousness, rapid pulse, sweating. If symptoms appear, discontinue medication for several days, then reinstitute at a lower level. Since myxedema patients with heart disease may suffer seriously from abrupt increases in dosage, caution should be exercised in adjusting dosage. **Dosage:** Generally, the initial adult dosage is 0.1 mg. daily. This may be increased in small increments every one to three weeks until proper metabolic balance is achieved. **Available:** Bottles of 100 tablets, in six potencies: 0.025 mg. (violet), 0.05 mg. (peach), 0.1 mg. (pink), 0.2 mg. (green), 0.3 mg. (yellow), and 0.5 mg. (white).

The AMA's Exhibits Section:

Its 111 Exhibits Play a Big Role in both Graduate Medical Education and Health Education

One of the most popular AMA exhibits is the "Transparent Twins," created primarily for a high school-level audience. The exhibit provides a concise explanation of 25 body organs, plus the skeleton and nervous system. It has been shown to more than 60 audiences.

Since 1899 the AMA has employed the eye-catching, high-impact medium of exhibits to further postgraduate medical education. But it has been only within the past 15 years, through the creation of the Bureau of Exhibits, that the AMA has expanded use of the exhibit technique to further public health education as well.

The Bureau was started by since retired Thomas Hull, PhD, an international authority on scientific exhibits and the man for whom the Hull Award, bestowed annually at the AMA's Clinical Convention, is named. Through reorganization the Bureau now is known as the AMA's Exhibits Section of the Program Services Department.

Emphasizing the extent of its operation is the fact that each year more than two-million persons visit these exhibits, presented from coast to coast at medical meetings, health fairs, state and county fairs and other health programs arranged by medical societies, auxiliaries and those in the allied professions.

In its peak year, 1966, the section booked 435 exhibits in 117 cities for the equivalent of 2,391 "show days."

Currently the section offers 111 exhibits, an all-time high. About half are aimed at the medical profession and the other half toward the general public. Their insured value is $197,000.

The complex tasks of creating, building, maintaining, scheduling and shipping the exhibits fall under the direction of Russell Cheadle, director of the Exhibits Section. Ideas for exhibits and suggested copy messages for them emanate from AMA councils, committees and departments when changing situations or emphasis suggest the need for an exhibit on a particular medical subject. Before an exhibit can be built, however, it must be approved by the AMA's Staff Committee on Printed Materials and Exhibits, which reviews the potential need, practicality and costs.

One entirely new exhibit being readied for use early this spring is, "The Drug Dependent Patient," designed for the profession. The exhibit describes four basic families of dependency inducing drugs, tells how to diagnose drug dependency and outlines treatment for it.

Developing entirely new exhibits, however, accounts for only about half the actual construction. The remainder is directed toward rebuilding damaged exhibits or redesigning those requiring updated messages.

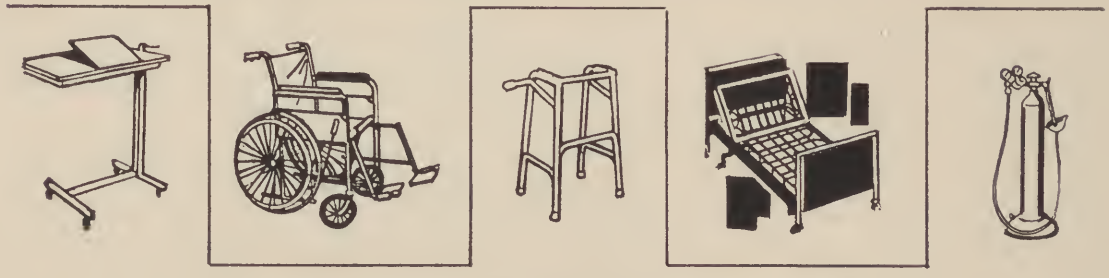
Two such revised exhibits now being completed are "Poisoning in the Home" and "Digestion." Occasionally new exhibits can be built from the basic structure of retired exhibits. Such is the case with the new "Health Careers" exhibit which became available last fall. Currently, there are four models of this exhibit—all built from spare parts.

Naturally, it takes plenty of space to house exhibits at their permanent quarters. There are 3,500 square feet of space at the AMA's "exhibit warehouse" in Chicago. Although the AMA's exhibits are "built to travel," they nevertheless take a beating in their constant travels and period-

ically must be rehabilitated at the warehouse.

The Exhibits Section's biggest volume comes from fairs, particularly health fairs. Last year the section provided exhibits for 14 health fairs, the largest of which was the highly successful Nebraska Centennial Health Fair, sponsored by national, state and county health organizations under the direction of the Lancaster County Medical Society. The event, attracting 92,000 persons, featured more than 100 exhibits, including several which were built locally especially for the fair. Indicative of its success and the excitement it created is the fact that at one booth 2,000 potential eye-bank donors were signed.

Among other big health fairs last year were the Annual Chicagoland Health Fair, which attracted 62,000 persons and one presented at Abilene, Texas, which featured 100 exhibits, including 30 loaned by the AMA. To accommodate this large show, the AMA exhibits were shipped, "piggyback." Among the smaller health fairs was one held at the school gymnasium in Benton Harbor, Michigan. It included 40 exhibits which were viewed by 3,500 persons.



"It takes at least a year of careful planning for anyone to stage a health fair properly," Mr. Cheadle pointed out, "but you can always count on them being immensely popular. After all, a health fair is one of the few places where people can get information about themselves.

"They're also a convenient, practical way for physicians of the community to render a public service." he said. "Since time and other factors limit physicians in their public service efforts, health fairs are an ideal way to perform such a service."

To obtain AMA exhibits or investigate the possibilities, medical societies and individual physicians should direct inquiries to the Exhibits Section. A minimum of two months' written notice is encouraged to assure availability of the exhibits sought. Several months' notice is essential for health fairs or other showings requiring a large number of exhibits. Also available is essential information needed by those seeking to plan health fairs.

A complete description, including a photograph, of each AMA exhibit is contained in the exhibits' catalog maintained by each state medical society. Revised information is provided annually to state medical societies so that individual descriptions of each exhibit are current. All AMA exhibits are loaned with no charge other than shipping costs.

ASCO

MEDICAL ASSISTANTS' WEEK

APRIL 14-20

For the past two years the Governor has proclaimed a week to be set aside for the glorification of medical assistants in Maryland. Hopefully, this will be repeated this year. As part of the activities on the part of the Maryland Association of Medical Assistants during this week, members will volunteer their services to man the Health Evaluation Booth at the Alcazar for the Medical and Chirurgical Faculty meeting on April 17, 18 and 19, as well as run the Coffee Booth.

On Friday evening, April 19, the medical assistants are planning a variety show which will be held at the Loch Raven Elementary School, 1801 Glen Keith Boulevard, near Taylor Avenue, from 8:00-10:00 P.M. Talent for the show has been donated by professionals and semi-professionals so this should be top-grade entertainment. Acts already in rehearsal include a French Can Can chorus number by dancers from the Dorothy Virgilio School of Dance; the Grapes of Wrath, a rock and roll band; a Hawaiian Hula dance by Miss Donna Shope, of the Maryland Cabaret Theatre; Specialty Act by The Fantastiks; Barbershop Quartet numbers by the Sweet Adelines; folk singing with audience participation by That Generation; "Take Back Your Mink" by Miss Donna May Shop; Comedy act; and music by The Fabulous Monarchs, a fifteen-piece band that has recently cut two new records and is going on a Viet Nam tour with Bob Hope this summer. There will be two-hundred records given away free to the first teenagers to arrive at the auditorium. These will be donated by the Master of Ceremonies, Mr. Charles Weber who is Public Relations representative for the Kerby Scott show and who has his own recording studio. Mr. Weber

has been most kind to offer his services to help promote this show and it is hoped that there will be a tremendous audience to repay him for his efforts in our behalf. Tickets may be obtained from Mrs. Nell Chaney by calling 732-4730, ext. 453. These sell for $1.50 for adults and $.75 for children under 12.

On Saturday, April 20 the annual meeting of the M.A.M.A. will be held at the Sheraton-Belvedere Hotel. Registration will begin at 10:00 A.M. for the business meeting, which will include election of new officers. At 1:00 P.M. the afternoon seminar will be open by a welcoming address by Milton B. Kress, MD, Asst. Professor of Medicine at The Johns Hopkins University and Chief of Pulmonary Diseases at Church Home and Hospital. On the program following will be Ephraim Lisansky, MD, Associate Professor of Medicine and Psychiatry at the University of Maryland, who will speak on "Psychosomatic Medicine," and Mrs. Eleanor Nash, columnist for the Sunpapers, who will speak on "Public Relations." In the evening there will be a cocktail party and banquet at the Belvedere, when Ian Anderson, MD, of Church Home and Hospital will be Master of Ceremonies and Rev. Thomas Subock, of Annapolis, will act as Chaplain. This seminar and the festivities following are open to the general public and anyone desiring to attend should also contact Mrs. Chaney.

One of the highlights of the meeting will be welcoming the members of the Montgomery County Medical Assistants Association, a new chapter which held its first meeting on February 21 in Wheaton, Maryland. Mrs. Dorothy Hartel helped to organize this group and she and Mrs. Chaney, M.A.M.A. President, attended the meeting. Officers were installed and are listed below:

President—Sandra Orrison
Vice President—Sandra Moore
President Elect—Frances Whittaker
Secretary—Jean Klopfer
Treasurer—Margaret Eid

There was much enthusiasm for their new enterprise and we expect much from this group. Beldon Reap, MD, of the Medical Examiner's Office, Montgomery County, was present as Advisor to this chapter and gave a welcoming address at the meeting. Also on their Board of Advisors are: Donald Bucy, MD, Steven Conway, MD, Thomas Johnson, MD, and Mr. John Loy. Congratulations on a most successful meeting to the MCMAA!

WILLIAM H. RORER, INC.
Fort Washington, Pa.

Medicare Deadline: April 1st

Over one million older people in the country are receiving letters this week, reminding them that they have only until April 1 to sign up for the voluntary doctor bill insurance under medicare.

In the letter, Robert M. Ball, Commissioner of Social Security, points out that nearly 18 million people—92% of those over 65—have already signed up for the doctor bill insurance to supplement their basic hospital insurance under medicare. Since the program started only 18 months ago, he notes, it has helped pay over 28 million medical bills, totaling almost $1.3 billion.

About 1.6 million people 65 and over missed out on their first chance to elect the supplementary medical insurance, according to Commissioner Ball. The Social Security Administration is sending letters to the 1.1 million for whom it has addresses—those who have been issued medicare cards showing that they are covered only by the basic hospital insurance part of medicare.

The Social Security Administration does not have current addresses for the other 500,000 older Americans because they have never applied for even the hospital insurance under medicare.

Just about everyone now over 65 is eligible for the voluntary part of medicare—whether or not they have ever worked under social security, and whether retired or still working. He urged persons 65 and over and not signed up for medicare's doctor bill insurance to get in touch with their social security district office if they do not get a letter in a week or so.

In his letter, Commissioner Ball lists 8 reasons

• Photo-Offset Printing • Letterpress Printing

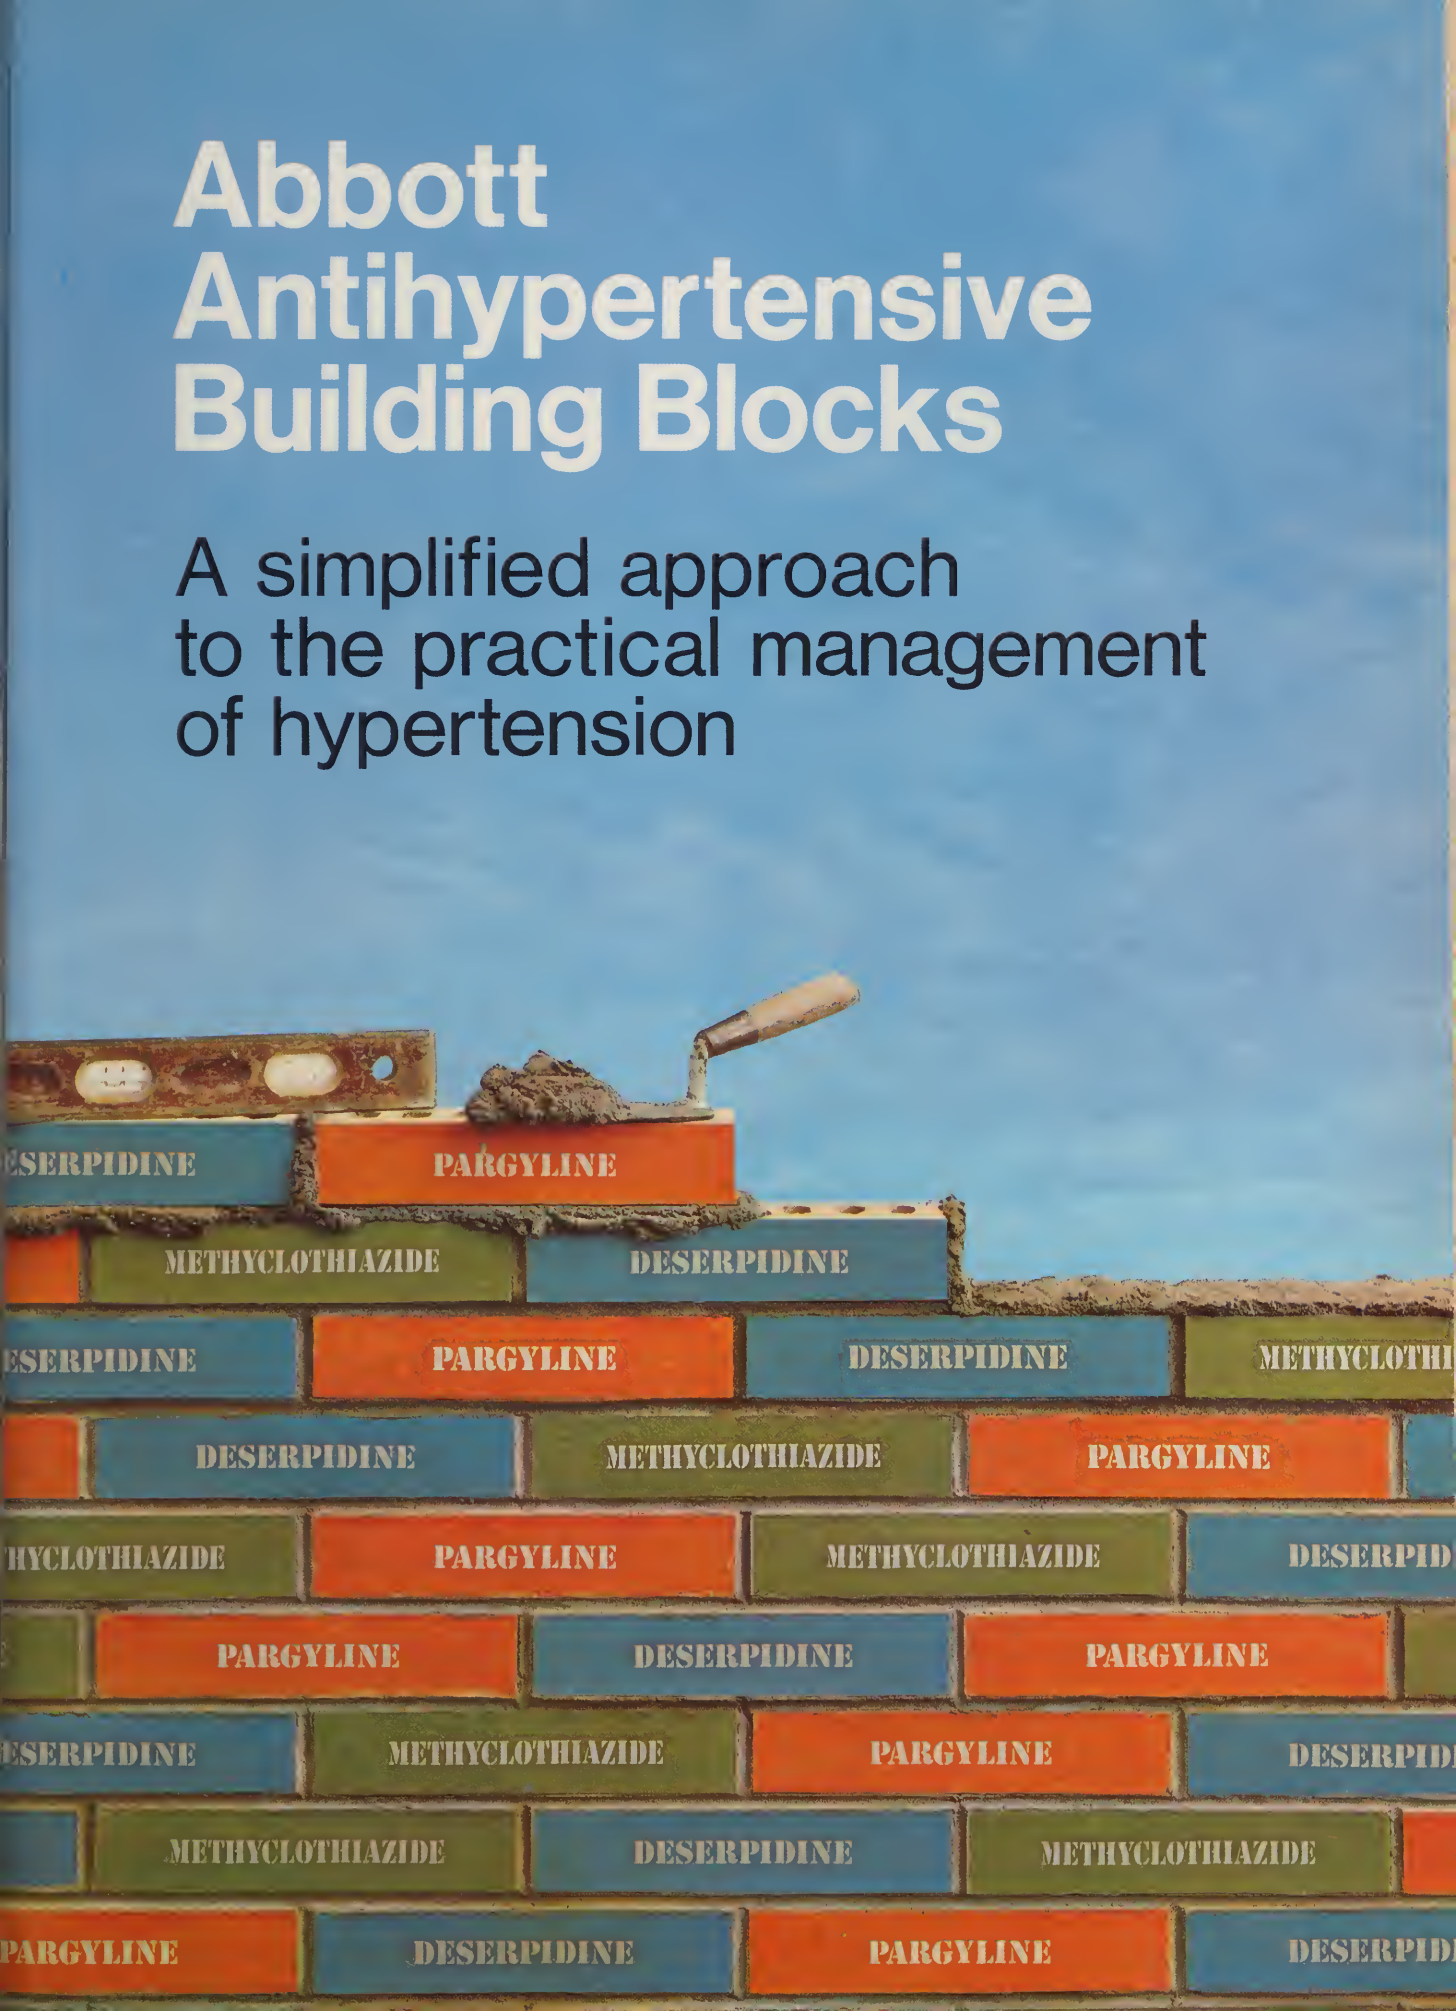
306 N. Gay Street Baltimore, Md. 21202

that older people without the supplementary doctor bill insurance ought to consider. He also encloses a leaflet explaining the medical insurance benefits and an enrollment card to be sent back showing whether or not the person wants the protection.



As reasons for signing up now, the Commissioner cites:

- That the $4 premium rate represents an excellent buy because it represents only half the cost of the protection. The Government pays the other half.
- It may not be possible to obtain the basic coverage any other way. For the most part, Blue Cross-Blue Shield and the commercial insurance companies have rewritten their policies for people 65 and over to supplement medicare.
- The 1967 changes in the law make it easier to collect medical insurance benefits.
- There are a number of improvements in medical insurance benefits, for example, the payment of the full reasonable charges for X-ray or laboratory services furnished to a bed-patient in a hospital and coverage of physical therapy services at home or elsewhere.
- The increase of 13% in social security benefits, recently enacted by Congress will in most cases be more than enough to cover a social security beneficiary's half of the premium—and to increase his monthly check.
- Beginning in April, covered outpatient hospital benefits will be paid only under the medical insurance part of medicare. To have outpatient hospital coverage, therefore, the older person must be signed up for the medical insurance program.
- The protection will cost more later on. The premium is 10% higher for each year that has passed since the older person's first opportunity to enroll.
- People over 65 and still not signed up for the supplementary medical insurance by April 1, cannot get the protection until July 1, 1969. A delay of more than 3 years after the person's first opportunity to enroll means that he will not be able to get the protection at all.

Abbott Antihypertensive Building Blocks

A simplified approach to the practical management of hypertension

Enduron: (methyclothiazide) A basic building block for mild hypertensives

Excellent day-long Na^+ output, yet easy on the K^+

Enduron provides an excellent starting therapy. Your patient's sodium excretion is greatly enhanced. Yet potassium loss is low.

The therapeutic action is smooth, and persits for a full 24 hours. With Enduron you can prescribe convenient once-a-day dosage without skimping your patients on day-long thiazide effectiveness.

Of course, as with all thiazides, supplemental dietary potassium should also be considered.

Use Enduron as a basic therapy in patients with mild to moderate hypertension. A single 5-mg. tablet each day is ample in most cases.

Once a day, every day

ENDURON®

METHYCLOTHIAZIDE

MILD TO MODERATE TO SEVERE

See Brief Summary on final page of advertisement

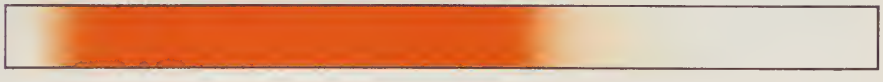
Enduronyl: Its deserpidine component adds response in moderate hypertension

Less frequent rauwolfia side effects than with reserpine

When you wish to build further response, consider shifting to Enduronyl.

Enduronyl adds a building block of *deserpidine*. This is a purified rauwolfia alkaloid available only from Abbott. It adds good antihypertensive and tranquilizing activity. Yet its incidence of untoward effects, particularly lethargy and depression, is lower than with reserpine.

Enduronyl is available plain or Forte. The latter provides its variation where most helpful, by doubling the deserpidine.

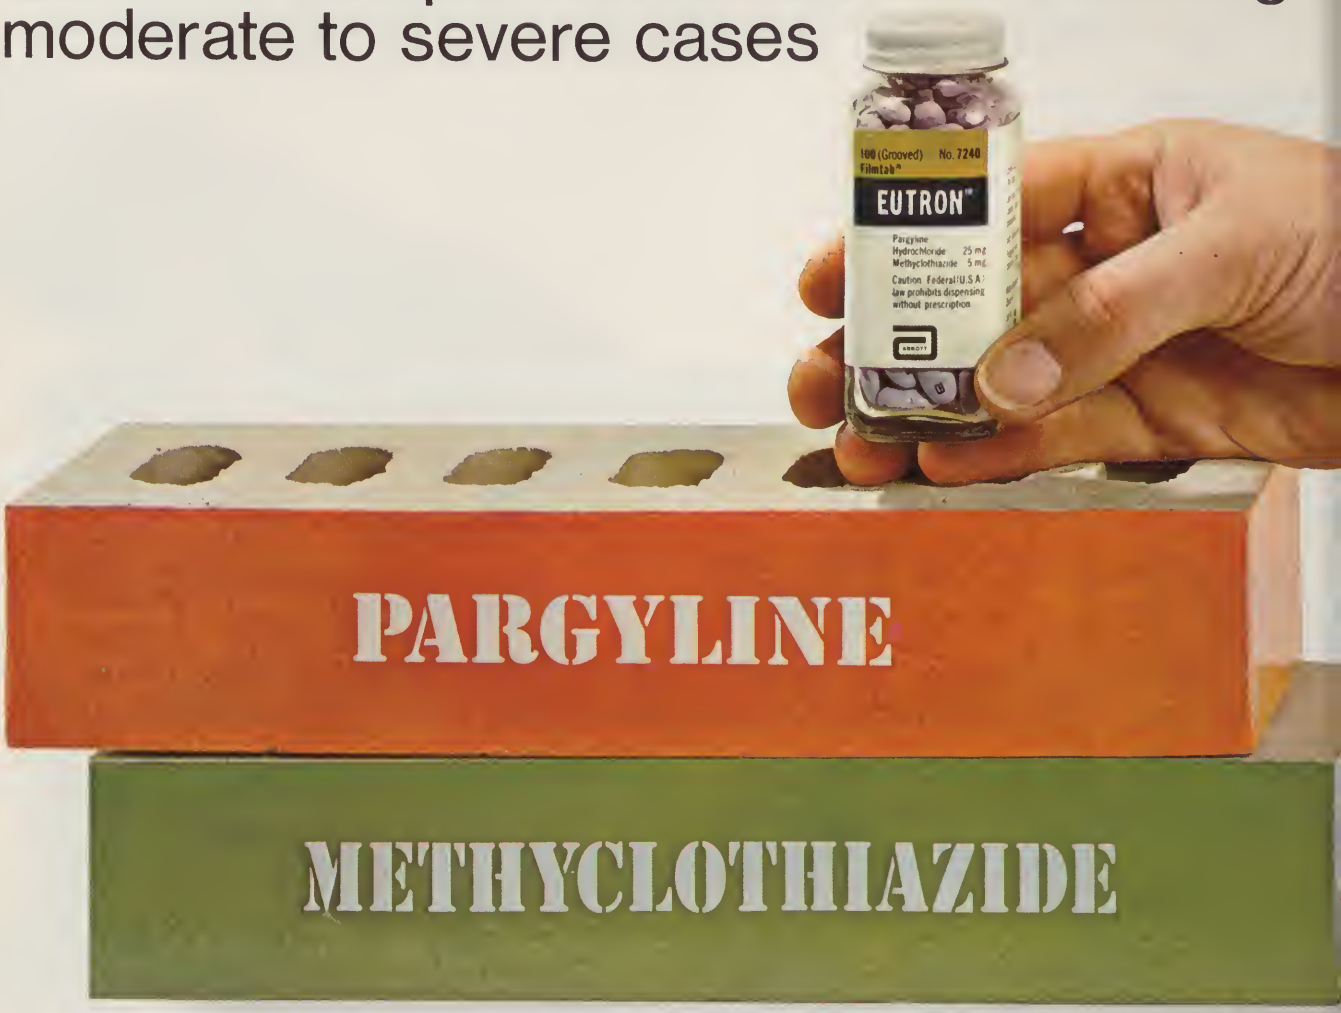


Use Enduronyl for patients throughout the broad range of mild to moderately severe hypertension.

Once a day, every day

ENDURONYL®

METHYCLOTHIAZIDE 5 mg. with DESERPIDINE 0.25 mg. or (FORTE) 0.5 mg.



MILD TO MODERATE TO SEVERE

See Brief Summary on final page of advertisement

801094

Eutron: A unique combination for handling moderate to severe cases

Affords almost uniform diastolic reduction in all body positions

Eutron lowers diastolic pressures nearly equally, whether your patient is standing up or lying down.

Thus, in clinical trials, average *standing* diastolic readings were reduced from 112 pre-treatment to 90 post-treatment; *sitting* from 115 to 95; and *recumbent* from 112 to 94.

Note that following Eutron, the diastolic reductions were nearly alike in all three body positions.

Use Eutron for managing your moderate to severe cases. Its building blocks enhance each other; hence lesser doses often suffice.

Once a day, every day

EUTRON™

PARGYLINE HYDROCHLORIDE 25 mg.
with METHYCLOTHIAZIDE 5 mg.

MILD TO MODERATE TO SEVERE

See Brief Summary on final page of advertisement

801094

ENDURON® | ENDURONYL®

METHYCLOTHIAZIDE

Each tablet contains Methyclothiazide 5 mg. with Deserpidine 0.25 mg. or 0.5 mg

Indications: Edema and mild to moderate hypertension (Enduron), and mild to moderately severe hypertension (Enduronyl). More potent agents, if added, can be given at reduced dosage.

Contraindications: Sensitivity to thiazides; severe renal disease (except nephrosis) or shutdown; severe hepatic disease or impending hepatic coma (hepatic coma due to hypokalemia has been reported in patients on thiazides). Do not use Enduronyl in severe mental depression, suicidal tendencies, active peptic ulcer, or ulcerative colitis.

Warnings: Consider possible sensitivity where there is history of allergy or asthma. If added potassium is indicated, dietary supplementation is recommended. Reserve enteric-coated potassium tablets for cautious use only when necessary, as they may induce serious or fatal small bowel lesions (stenosis with or without ulceration), cause obstruction, hemorrhage, and perforation often requiring surgery; discontinue them immediately if abdominal pain, distention, nausea, vomiting, or g.i. bleeding occurs. Neither Enduron nor Enduronyl contains added potassium.

Precautions: Use thiazides cautiously in severe renal dysfunction, impaired hepatic function or progressive liver disease; also in pregnancy (bone marrow depression, thrombocytopenia, and altered carbohydrate metabolism have been reported in certain newborn). In surgery, thiazides may reduce response to vasopressors, and increase response to tubocurarine. Antihypertensive response may be enhanced following sympathectomy. Watch for electrolyte imbalance (e.g., hyponatremia) in all patients. In hypokalemia (especially in digitalized patients) give supplemental potassium. In hypochloremic alkalosis, give supplemental chloride.

Use rauwolfias with caution in patients with history of peptic ulcer. Rauwolfias with anesthetics may produce hypotension and bradycardia. Discontinue Enduronyl two weeks before elective surgery. Consider vagal blocking agents during emergency surgery. In epilepsy, adjust anticonvulsant dosage. In electroshock, shorten stimulus strength and duration. In occasional patients with depressive tendencies, rauwolfias may precipitate severe mental depression that usually disappears when drug is stopped.

Adverse Reactions: Thiazide reaction include blood dyscrasias (thrombocytopenia with purpura, agranulocytosis, aplastic anemia); elevation of BUN, serum uric acid or blood sugar; anorexia, nausea, vomiting, diarrhea, headache, dizziness, paresthesia, weakness, skin rash, photosensitivity, jaundice, symtomatic gout, and pancreatitis. Cutaneous vasculitis in the elderly has been reported with other thiazides. Adverse effects with deserpidine are qualitatively similar to those with reserpine, but their incidence is lower. These include nasal stuffiness, abdominal cramps or diarrhea, nausea, headache, weight gain, reduced libido and potency, peptic ulcer aggravation, epistaxis, skin eruption, asthma in susceptible patients, electrolyte imbalance, excessive salivation, and a reversible Parkinson's syndrome. Excessive drowsiness, fatigue, weakness, and nightmares may signal mental depression. Thrombocytopenia, purpura, and a symptom manifested by dull sensorium, deafness, uveitis, glaucoma, and optic atrophy are rare allergic reactions to other rauwolfias. Hypotension from antihypertensive agents may precipitate angina attacks in susceptible individuals. Usually adverse reactions disappear when drug is withdrawn.

EUTRON™

Each tablet contains Pargyline Hydrochloride 25 mg. with Methyclothiazide 5 mg.

Indications: For treatment of patients with moderate to severe hypertension, especially those with severe diastolic hypertension. Not recommended for patients with mild or labile hypertension amendable to therapy with sedatives and/or thiazide diuretics alone. It is desirable to establish the dosage of Eutron by administering component drugs separately.

Contraindications: Pheochromocytoma, advanced renal disease, increasing renal dysfunction, paranoid schizophrenia and hyperthyroidism. Hepatic coma has been reported as consequence of hypokalemia with thiazide therapy. Until further experience is gained not recommended for patients with malignant hypertension, children under 12, or pregnant patients.

Concomitant use of the following is contraindicated: other monoamine oxidase inhibitors; parenteral forms of reserpine or guanethidine; sympathomimetic drugs; foods high in tyramine such as cheese; imipramine and amitriptyline, or similar antidepressants; methyldopa. 2 week interval should separate therapy and use of these agents.

Methyclothiazide is contraindicated in patients with known sensitivity to thiazides.

Warnings: Pargyline hydrochloride is a monoamine oxidase inhibitor. Warn patients against eating cheese, and using alcohol, proprietary drugs or other medication without the knowledge of the physician. When indicated, alcohol, narcotics (meperidine should be avoided), antihistamines, barbiturates, chloral hydrate, and other hypnotics, sedatives, tranquilizers, or caffeine, may be used cautiously in reduced dosage. In emergency surgery ¼ to ⅕ the usual dose of narcotics, analgesics, and other premedications should be used avoiding parenteral administration where possible. Carefully adjust dose of anesthetics to response of patient. Withdraw pargyline two weeks before elective surgery.

Warn patients about the possibility of postural hypotension. Those with angina or coronary artery disease should not increase physical activity with an improvement in well being. Pargyline may lower blood sugar.

Avoid use of enteric-coated potassium tablets, as these may induce serious or fatal small-bowel lesions consisting of stenosis with or without ulceration. These small-bowel lesions have caused obstruction, hemorrhage and perforation frequently requiring surgery. Medication should be discontinued immediately if abdominal pain, distension, nausea, vomiting or GI bleeding occurs. These products contain no added potassium salts and if added potassium intake is desired, dietary supplementation is recommended. Coated potassium tablets should be reserved for cautious use when adequate dietary supplementation is impractical. In patients with a history of allergy or asthma the possibility of sensitivity reactions should be considered.

Precautions: Measure blood pressure while patient is standing to determine antihypertensive effect. Use with caution in hyperactive or hyperexcitable persons. Such persons may show increased restlessness and agitation. Withdraw drug during acute febrile illness. Watch patients with impaired renal function for increasing drug effects or elevation of BUN and other evidence of progressive renal failure; withdraw drug if such alterations persist and progress. Use with caution in patients with liver disease. As with all new drugs, complete blood counts, urinalyses, and liver function tests should be performed periodically. With prolonged therapy, examine patients for change in color perception, visual fields and fundi. Also reported have been: blood dyscrasias including thrombocytopenia with purpura, agranulocytosis and aplastic anemia; elevations of BUN, serum uric acid, or blood sugar. Symptomatic gout may be induced. In surgical patients thiazides may reduce response to vasopressors and increase response to tubocurarine.

Adverse Reactions: Pargyline may be associated with orthostatic hypotension. Mild constipation, slight edema, dry mouth, sweating, increased appetite, arthralgia, nausea and vomiting, headache, insomnia, difficulty in micturition, nightmares, impotence, delayed ejaculation, rash, and purpura have been encountered with pargyline. Hyperexcitability, increased neuromuscular activity (muscle twitching) and other extrapyramidal symptoms have been reported in a few patients with reduced cardiac reserve.

During intensive or prolonged therapy, guard against hypochloremic alkalosis and hypokalemia (especially the latter if patient is on digitalis). Observe all patients for signs of hyponatremia ("low salt" syndrome).

Reported thiazide reactions also include anorexia, nausea, vomiting, diarrhea, headache, dizziness, paresthesia, weakness, skin rash, photosensitivity, jaundice, and pancreatitis. Nocturia has been observed with the combination.

COMPONENT MEDICAL SOCIETIES

BALTIMORE CITY MEDICAL SOCIETY

SEMIANNUAL BUSINESS MEETING
FRIDAY, APRIL 5, 1968, 8:30 P.M.

AGENDA

Call to order
Minutes of previous meeting.
Election of new members.
Moment of silence in memory of deceased members.
Review of business to be transacted at House of Delegates Meetings April 17, 1968, 9:30 A.M. and April 19, 1968, 2:00 P.M.
Other new business.

At the monthly meeting on February 13, 1968, the Board of Directors of the Baltimore City Medical Society approved the waiver of dues for Arthur Owen, MD, and Isaac Miller, MD, because of incapacitating illness; and extended leave of absence for Adalbert F. Schubart, MD, on sabbatical leave at Johannes Gutenberg University in Germany during 1968.

Mrs. Leonard H. Warres, president of the Woman's Auxiliary to the Medical and Chirurgical Faculty of Maryland, presented a plan to increase the membership of the auxiliary which entailed the additional assessment of $6 per year from Society members. The Board discussed the plan but felt it could not be recommended.

Three problem cases were examined by the Professional Relations Committee. One has since been referred to the Mediation Committee of the Faculty and the other two were judged and appropriate dispositions were recommended.

The recent changes in the by-laws of the Baltimore City Medical Society necessitates reprinting and circulating the more up-to-date material. The Board feels this is an opportune time to undertake this job since the original supply is almost depleted.

The Board discussed nominees to be recommended to the nominating committee of the Faculty for the offices of President-elect, First, Second, and Third Vice-President, Secretary, Treasurer, Councilors, Delegate to AMA, Alternate

Delegate, Program and Arrangement Committee, Library Committee, Finney Fund Committee, and the Board of Medical Examiners. The selection was made and the names submitted to the nominating committee.

The problem of filling the vacancies in the Baltimore City Medical Society's list of Delegates was referred to Harry Connolly, MD, chairman of the Nominating Committee.

Letters written to the Editor of the Sunpapers from Israel Zeligman, MD, and Harry Robinson, MD, were read and the attitude was heartily supported by the Board of Directors.

Also read was a letter from John Collins Harvey, MD, confirming the appointment of Frank F. Furstenberg, MD, to the Nursing Home Subcommittee; and a letter from Governor Agnew in regard to the establishment of a Special AD HOC Committee to be chaired by Russell A. Nelson, MD.

Arthur E. Cocco, MD

mudrane®

for

- EMPHYSEMA
- ASTHMA
- CHRONIC BRONCHITIS
- BRONCHIECTASIS

The fast-disintegrating uncoated tablet gives relief in 15 minutes

Each tablet contains:

Potassium Iodide . . . . . 195 mg.
Aminophylline . . . . . 130 mg.
Phenobarbital, Caution: May be habit forming . . . 21 mg.
Ephedrine HCl . . . . . 16 mg.

FEDERAL LAW PROHIBITS
DISPENSING WITHOUT PRESCRIPTION

Precautions: Usual for aminophylline-ephedrine-phenobarbital. Iodides may cause nausea, long use may cause goiter. Discontinue if symptoms of iodism develop.

Iodide contraindications: tuberculosis, pregnancy.

DOSAGE

One tablet, with full glass of water, 3 or 4 times daily.

Dispensed in bottles of 100 and 1000 tablets.

MUDRANE GG—Formula, dosage and package identical to Mudrane—*except*—100 mg. glyceryl guaiacolate replaces the potassium iodide. The value of Mudrane cannot be enjoyed by a small group in which K.I. is contraindicated. Mudrane GG is prepared for this group.

MUDRANE GG ELIXIR—Four 5 cc teaspoonfuls is equivalent to one Mudrane GG tablet. Dosage adjusted to age and weight of child. Mudrane GG Elixir is for pediatric patients and those who think they cannot swallow tablets. Dispensed in pint and half gallon bottles.

ANESTHESIA STUDY COMMITTEE

Tuesday, April 23, 1968 7:30 P.M.

Joint Anesthesia Study Committee of the Baltimore City Medical Society and the Baltimore City Health Department.

CARROLL COUNTY MEDICAL SOCIETY

At its January meeting the society elected the following officers to serve during 1968: Karl M. Green, MD, President; William R. O'Rourke, MD, President Elect; Dean Griffin, MD, Secretary; John S. Harshey, MD, Treasurer; and Mrs. Nancy B. Jones, Executive Secretary.

Also presented during the meeting was a panel discussion entitled "The Pill and the Single Girl." Participating panelists included the chairman, Gertrude Gross, MD, representing the psychiatric point of view; Charles Mawhinney, Jr., MD, OB-Gyn.; William O'Rourke, MD, Family Practice; The Rev. Mr. Harold Helfrich, Minister; Mrs. Dolores Snyder, BS, MA, Director of Pupil

Services with the Carroll County Board of Education.

The panelists underscored the importance of conducting sex education on the family level, in schools, and in the doctor's office.

* * *

Community Service projects in which the society was active during 1967 were the Mass Measle Immunization Program with the co-sponsorship of the Westminster Jaycees; and the Medical Vocations Explorer Post of the Boy Scouts of America. Various members of the society have been active on boards of the various national foundations such as the TB, and the Heart Association.

Projects for 1968 will include the establishment and development of a historical exhibit depicting the rural physician of 50 to 100 years ago. The exhibit will be in one of the historical buildings in Carroll County. Needed in particular are furnishings characteristic of a doctor's office of that period. Persons interested in donating or loaning furnishings and equipment to this permanent exhibit should contact Martin Gross, MD, 334 E. Main St., Westminster, Md., Telephone: 848-8445.

Philip W. Mercer, MD
Journal Correspondent

BALTIMORE COUNTY MEDICAL SOCIETY

On February 3, 1968, the Baltimore County Medical Society and the Hospital Staff of St. Joseph's Hospital held a joint meeting. Frank Faraino, MD, of the Staff of the Hospital, arranged and presented the following scientific program:

The Biological Basis of Tissue Transplantation was discussed by Norman D. Anderson, MD, Assistant Professor of Medicine, The Johns Hopkins Medical School. Ervin A. Gombos, MD, Chief Nephrology Division, Veteran's Administration Hospital, Washington, D.C., presented a talk on **Chronic Hemodialysis. Transplantation of the Kidney** was the subject of the talk given by George Schreiner, MD, Professor of Medicine, Georgetown University Medical School. Presented by John J. White, MD, Assistant Professor of Surgery, The Johns Hopkins Medical School, was a lecture on **Clinical Experience with Kidney and Lung Transplantation.**

Following the scientific program, a business meeting was held. Gordon Grau, MD, chairman

of the Board of Governors, gave a synopsis of the Board Meeting held on January 17, 1968.

The following action was approved by the Society: The Baltimore County Medical Society will continue its membership in the Baltimore Area Health and Welfare Council; it was decided to present a Past President's Plaque to the widow of Lewis Dalmau, MD; and honorary membership was granted to F. A. Holden, MD, and Harry Butler, MD.

The Legislative Committee held a dinner with the Baltimore County Delegation in Annapolis on February 1, to discuss matters of health.

Melvin Davis, MD, read a resolution regarding keeping the Medical Examiner's Office separate from the Health Department. This was unanimously approved and will be submitted to the House of Delegates of the Medical and Chirurgical Faculty in April.

The Medical Society will hold a dinner dance on Sunday, March 31, 1968, 6:30 P.M., at the Tail of the Fox in Timonium. Herbert J. Levickas, MD, is chairman.

Chances are she'll be fever-free in less than 48 hours...

with Erythrocin®-Sulfas

ERYTHROMYCIN-
TRISULFAPYRIMIDINES,
ABBOTT

FOR RAPID CLINICAL RESPONSE

In a recent series of clinical studies, Erythrocin-Sulfas was used to treat 516 febrile cases of suspected bacterial infection. Of these, *85.5% were completely afebrile within 48 hours.*

FOR WIDE BACTERIAL COVERAGE

Among the total of 661 patients (febrile and afebrile) who could be evaluated, the *clinical cure rate* was 92.2%*

FOR OPTIMAL PATIENT ACCEPTANCE

Three forms were used in the studies, prescribed according to the age and personal preferences of individual patients:

Erythrocin® ethyl succinate-**Sulfas Granules**
erythromycin ethyl succinate-trisulfapyrimidines
for oral suspension

Erythrocin® ethyl succinate-**Sulfas Chewable**
erythromycin ethyl succinate-trisulfapyrimidines
chewable tablets

Erythrocin® stearate-**Sulfas Filmtab®**
erythromycin stearate-trisulfapyrimidines tablets

Please see Brief Summary on next page.

ABBOTT

*Clinically cured included patients with complete symptomatic relief and those who had partial symptomatic relief within 72 hours with subsequent clinical cure.

803446

BRIEF SUMMARY FOR
Erythrocin®-Sulfas

Indications For mixed infections which are more susceptible to the combination than to either agent alone. These may include susceptible gram-positive and/or gram-negative mixed infections. Not recommended in the treatment of infections expected to respond to full therapeutic doses of the antibiotic or sulfonamide alone.

Contraindications Known hypersensitivity to erythromycin or sulfonamides. Because of the possibility of kernicterus with sulfonamides, do not use in pregnancy at term, in premature or in newborn infants during first week of life.

Warnings As with other forms of sulfonamide therapy, use only after critical appraisal in patients with liver or kidney damage, urinary obstruction, or blood dyscrasias. Deaths have been reported from hypersensitivity reactions and blood dyscrasias following use of sulfonamides. Perform blood counts and liver and kidney function tests when used intermittently or for long periods.

Precautions, Side Effects Use sulfonamides with caution in patients with a history of allergy, including asthma. Mild allergic reactions (such as urticaria and other skin rashes) may occur. Serious allergic reactions have been extremely infrequent; if encountered appropriate countermeasures (e.g. epinephrine, steroids, etc.) should be administered and the drug withdrawn. Assure adequate fluid intake to prevent crystalluria and institute alkali therapy if indicated. In prolonged therapy, or when high dosage is used, maintain an alkaline urine. If oliguria occurs, discontinue therapy. Occasionally mild abdominal discomfort, nausea or vomiting may occur with erythromycin; generally improved by reduction of dosage.

If overgrowth of nonsusceptible organism occurs, withdraw the drug and institute appropriate treatment.

Adverse Reactions Sulfonamide therapy may be associated with headache, nausea, vomiting, diarrhea, hepatitis, pancreatitis, blood dyscrasias, neuropathy, drug fever, skin rash, urticaria, injection of the conjunctiva and sclera, petechiae, purpura, hematuria and crystalluria.

The Science of Communication as practiced at Monumental Printing

It's more than a science: it's an Art, the precise transliteration in print of an intangible idea for a heterogeneous group of critical readers.

Here, at Monumental Printing, we learned to handle the tools of intelligent communication by the empirical method: working with them. The brush and palette of our art, the chisel, the score, the script are simply words on paper. We learned their proper use over 50 years of practice by being permitted to print such Journals as:

Clinical Chemistry
Digestive Diseases
Fertility & Sterility
Occupational Medicine
Leprosy
Mental Hospitals
Psychiatric Studies and Projects
Psychosomatic Medicine

We speak *your* language. We know the difference between edema and enema; syndrome and symptom; sewage and sewerage. And when and why we should use 12 point Caslon Bold instead of 10 Stymie.

If you, too, need a *good* printer, let's communicate!

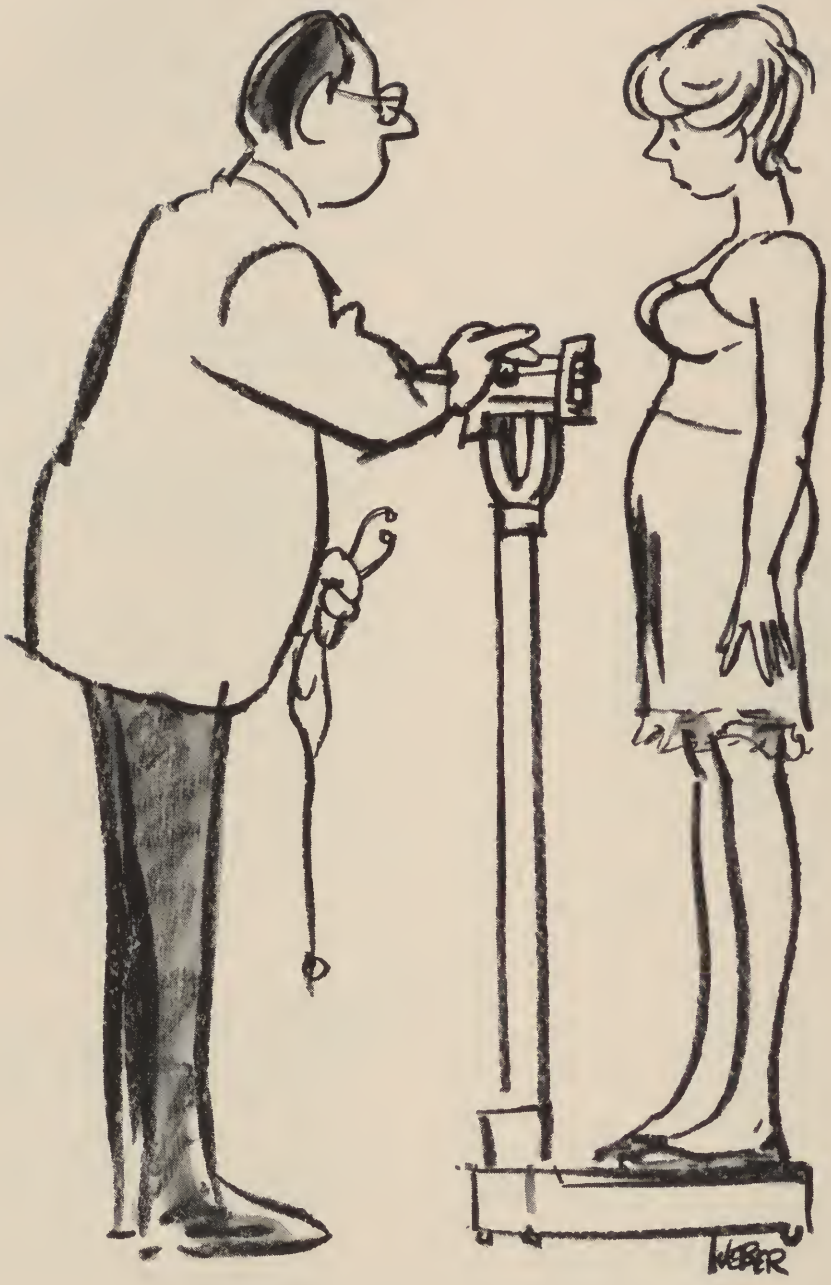
How come the world's richest companies buy the lowest priced dictating machine?

Eastern Airlines, Union Carbide or Gulf could easily afford any of the six nationally advertised dictating machines priced from $249.50 to $800. Yet they, as well as Ford, American Airlines, Allied Chemical, United States Lines, Goodyear Tire & Rubber, Home Life and many other giants of business, are buying the new Voca at $199.95. Could it be that the Voca is just as good, regardless of price? Or perhaps even better? Find out. We'll be glad to give you the full story. Phone, or mail the coupon today.

Alfred S. Bright, C.L.U.
Agency Manager,
HOME LIFE INSURANCE CO., N.Y.

"In our offices, we need dictating equipment we can depend on . . . that's why we selected VOCA."



Voca Patent Nos. 3,243,133; 199,189, other patents pending.

Only $199.95 complete with dictating or transcribing accessories.

Why? I want to know why experts choose the Voca dictating/transcribing machine over more expensive makes. Please send me full details and full color brochure.

"You're up ten pounds since your last physical. We're going to have to do something about that."

Get them while they're easily reversible.

Obesity doesn't happen suddenly. This insidious process has its beginning—and the chances of reversing it are better—during the *first 10 to 15 pounds of weight gain.* When a new dietary pattern must be established, consider the adjunctive use of BAMADEX SEQUELS. Combining the proven *anorexigenic* action of d-amphetamine with the *tranquilizing* effect of meprobamate, BAMADEX SEQUELS controls appetite throughout the day, usually with a single capsule daily.

Contraindications: Dextro-amphetamine sulfate: In hyperexcitability and in agitated prepsychotic states. Previous allergic or idiosyncratic reactions to meprobamate.
Precautions: Use with caution in patients hypersensitive to sympathomimetic compounds, who have coronary or cardiovascular disease, or are severely hypertensive.

Dextro-amphetamine sulfate: Excessive use by unstable individuals may result in psychological dependence.

Meprobamate: Careful supervision of dose and amounts prescribed is advised, especially for patients with known propensity for taking excessive quantities of drugs. Excessive and prolonged use in susceptible persons, e.g. alcoholics, former addicts, and other severe psychoneurotics, has been reported to result in dependence on the drug. Where excessive dosage has continued for weeks or months, reduce dosage gradually. Sudden withdrawal may precipitate recurrence of preexisting symptoms such as anxiety, anorexia, or insomnia; or withdrawal reactions such as vomiting, ataxia, tremors, muscle twitching and, rarely, epileptiform seizures. Should meprobamate cause drowsiness or visual disturbances, reduce dosage and avoid operation of motor vehicles, machinery or other activity requiring alertness. Effects of excessive alcohol consumption may be increased by meprobamate. Appropriate caution is recommended with patients prone to excessive drinking. In patients prone to both petit and grand mal epilepsy meprobamate may precipitate grand mal attacks. Prescribe cautiously and in small quantities to patients with suicidal tendencies.
Side Effects: Overstimulation of the central nervous system, jitteriness and insomnia or drowsiness. Dextro-amphetamine sulfate: Insomnia, excitability, and increased motor activity are common and ordinarily mild side effects. Confusion, anxiety, aggressiveness, increased libido, and hallucinations have also been observed, especially in mentally ill patients. Rebound fatigue and depression may follow central stimulation. Other effects may include dry mouth, anorexia, nausea, vomiting, diarrhea, and increased cardiovascular reactivity.

Meprobamate: Drowsiness may occur and can be associated with ataxia; the symptom can usually be controlled by decreasing the dose, or by concomitant administration of central stimulants. Allergic or idiosyncratic reactions: maculopapular rash, acute nonthrombocytopenic purpura with petechiae, ecchymoses, peripheral edema and fever, transient leukopenia. A case of fatal bullous dermatitis, following administration of meprobamate and prednisolone, has been reported. Hypersensitivity has produced fever, fainting spells, angioneurotic edema, bronchial spasms, hypotensive crises (1 fatal case), anuria, stomatitis, proctitis (1 case), anaphylaxis, agranulocytosis and thrombocytopenic purpura, and a fatal instance of aplastic anemia, but only when other drugs known to elicit these conditions were given concomitantly. Fast EEG activity, usually after excessive dosage. Impairment of visual accommodation. Massive overdosage may produce drowsiness, lethargy, stupor, ataxia, coma, shock, vasomotor and respiratory collapse.

Indications: Tofrānil is recommended for the treatment of depressive states of diverse psychopathology.
Contraindications: The concomitant use of Tofrānil and monoamine oxidase inhibiting (M.A.O.I.) compounds is contraindicated. Hyperpyretic crises or severe convulsive seizures may occur. Potentiation of adverse effects can be serious or even fatal. An interval of at least 7 days after M.A.O.I. therapy has been discontinued should be allowed before Tofrānil may be substituted. Initial Tofrānil dosage should be low, increases should be gradual, and the patient's progress should be carefully observed.
Warning: Clinical reports have suggested that there may be a risk of teratogenesis associated with the use of this compound during the first trimester of pregnancy. Unless, in the opinion of the prescribing physician, the potential benefits outweigh the possible risks, Tofrānil should not be used during the first trimester of pregnancy.
Cardiovascular complications, including myocardial infarction and arrhythmias, have occasionally occurred in susceptible individuals. Patients with cardiovascular disease should be given the drug only under careful observation and in low dosage.
Precautions: Since suicide is always a possibility in severely depressed patients and one which may persist until significant remission occurs, such patients should be carefully supervised during early treatment with Tofrānil. Some severely depressed patients may also require hospitalization and/or concomitant electroconvulsive therapy.
Because of its anticholinergic effect, caution should be observed in prescribing Tofrānil for patients with increased intraocular pressure.
In rare instances, transient cardiac arrhythmias have occurred in hyperthyroid patients and in patients receiving thyroid medication when Tofrānil was added to the regimen.
Imipramine may block the pharmacologic activity of guanethidine and other related adrenergic neuron-blocking agents.
The drug is not recommended at the present time in patients under 12 years of age.
Adverse Reactions: Dryness of the mouth, tachycardia, constipation, disturbances of accommodation, sweating, dizziness, weight gain, urinary frequency or retention, nausea and vomiting, peripheral neuritis, mild parkinson-like syndrome, tremors, rare cases of falling in elderly patients, confusional states (with such symptoms as hallucinations and disorientation), activation of psychosis in schizophrenics and agitation (includ-

When a milestone in life is marred by depression...

Often in the mind of the lonely, widowed, depression-prone individual, she's not gaining a daughter...she's losing a son. The occasion may be marred by such symptoms of depression as feelings of sadness, incapacity, helplessness and hopelessness.

In about 3 out of 4 cases, Tofrānil relieves symptoms of primary depression.

As maintenance therapy in primary depressive illness, it helps prevent relapse.

Although toxic reactions severe enough to require discontinuation of Tofrānil are uncommon, in patients with cardiovascular disease, thyroid disorders, increased intraocular pressure, or in those receiving anticholinergics (including antiparkinsonism agents), the special precautions listed in the Prescribing Information should be carefully observed. The use of Tofrānil in patients receiving M.A.O.I.'s is contraindicated.

Tofrānil® imipramine hydrochloride
Geigy

ing hypomanic and manic episodes) which may require dosage reduction and/or addition of a tranquilizer or temporary discontinuation of the drug, epileptiform seizures, orthostatic hypotension and substantial blood pressure fall in hypertensive patients, purpura, transient jaundice, bone marrow depression including agranulocytosis, sensitization and skin rash including photosensitization, eosinophilia, and mild withdrawal symptoms on sudden discontinuation after prolonged treatment with high doses. Occasional hormonal effects (impotence, decreased libido, and estrogenic effects) may be observed. Atropine-like effects may be more pronounced (e.g. paralytic ileus) in susceptible patients and in those using anticholinergic agents (including antiparkinsonism drugs).
Outpatient Adult Dosage: Initially, 75 mg. daily, increased, if necessary, to 150 or 200 mg. Maintenance dosage may be lower, 50 to 150 mg. daily, if possible.
Geriatric and Adolescent Dosage: Initially, 30 or 40 mg. daily, which may be increased according to response and tolerance. It is usually unnecessary to exceed 100 mg. daily.
A lag in therapeutic response, lasting from a few days to a few weeks, should be expected. When dosage recommendations are already being followed, increasing the dosage does not normally shorten this latency period and may increase the incidence of adverse reactions.
Availability: Tofrānil: Round tablets of 25 and 50 mg.; triangular tablets of 10 mg. for geriatric and adolescent use; and ampuls, each containing 25 mg. in 2 cc. for I.M. administration.

For Safe, Sure, Speedy Relief— —Get RESINOL GREASELESS!

Medical Scientists have conquered 6 dread diseases in the past decade, but they are largely in the dark, they admit, in finding relief for one age-old ailment—itching

New remedies containing antibiotics have been tested, but have often caused side effects which are worse than itching skin. After many years of research and testing, **Resinol Greaseless Cream** was developed. . . . A doctor's formula containing safe yet powerful ingredients, **Resinol Greaseless** contains an amazing, proven "anti-itch" medication called Resorcin, which quickly and effectively relieves most any kind of itching. Try **Resinol Greaseless** . . . You'll be delighted to find that it really works! At all drug stores. Buy a tube today.

"Early in 1953 Davis and Grand undertook a review of well established practices connected with the treatment of T. vaginalis infections. For instance, it had been accepted that an acid douche should be employed. This was based on cultural studies showing that when the pH was below 5 the organisms would die. They found that the commonly used vinegar douche with a pH of 3 showed no visible effect on T. vaginalis under the microscope in 15 minutes. Both citric and lactic acid were tested with similar results. Davis then recalled that in his early treatment of T. Vaginalis infections over 30 years ago he had had his first successes with alkaline preparations, and when he returned to their use the patients reported them more soothing than the previously used acid solutions."

(Am. J. Obst. & Gynec., 68:559, 1954)

Criteria for Cleansing Douche

"Daily douching often is a part of the treatment administered in dealing with T. vaginalis and since it is possible that the solution might contain agents that could hamper the regrowth of Doederlein bacillus, the following properties were said to be ideal.

1. It should contain a harmless, nonsensitizing detergent to remove mucous deposits and debris.
2. It should not contain any antibacterial agents, since the contact possible during douching would be so fleeting that anti-bacterial action could not be expected.
3. It should be acid in pH.

The 3rd property seems to be the most illogical and unimportant. If contact is so fleeting that antibacterial actions could not be expected, it would seem to follow that its acid quality would be of no consequence. Furthermore, acid solutions are irritating to the mucosa and oftentimes accentuate inflammation.

Actually, the value of a douche is generally conceded to be confined to its use as a cleansing and deodorizing agent. The encouraging results achieved with a detergent douche solution in treating infections of the vagina are probably attributable to the enormous normal recuperative powers of the vaginal tissues which have been under-estimated as a factor in the restoration of normal physiology.

Therefore, simple cleansing of the vagina with a non-irritating, mildly alkaline douche which is soothing to the vaginal mucosa and which penetrates and flushes out the dead organisms, debris and mucinous materials frequently enables the physiological processes to overcome the infection."

Charles B. Marek, M.D., Chief of Gynecology; Bon Secours Hospital: personal communications August 11, 1964

ERL

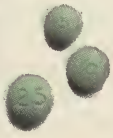
the "Librium® effect"
(chlordiazepoxide HCl)



For years, physicians have valued Librium (chlordiazepoxide HCl) Capsules for their reliable calming effect.

(in capsules)

Now, the same dependable antianxiety effect can be obtained with convenient tablets—Libritabs (chlordiazepoxide).

(in Libritabs™)
(chlordiazepoxide)

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Indicated when anxiety, tension and apprehension are significant components of the clinical profile.

Contraindications: Patients with known hypersensitivity to the drug.

Warnings: Caution patients about possible combined effects with alcohol and other CNS depressants. As with all CNS-acting drugs, caution patients against hazardous occupations requiring complete mental alertness (e.g., operating machinery, driving). Though physical and psychological dependence have rarely been reported on recommended doses, use caution in administering to addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions), following discontinuation of the drug and similar to those seen with barbiturates, have been reported. Use of any drug in pregnancy, lactation, or in women of childbearing age requires that its potential benefits be weighed against its possible hazards.

Precautions: In the elderly and debilitated, and in children over six, limit to smallest effective dosage (initially 10 mg or less per day) to preclude ataxia or oversedation, increasing gradually as needed and tolerated. Not recommended in children under six. Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects, particularly in use of potentiating drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions (e.g., excitement, stimulation and acute rage) have been reported in psychiatric patients and hyperactive aggressive children. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship has not been established clinically.

Adverse Reactions: Drowsiness, ataxia and confusion may occur, especially in the elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally observed at the lower dosage ranges. In a few instances syncope has been reported. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent and generally controlled with dosage reduction; changes in EEG patterns (low-voltage fast activity) may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice and hepatic dysfunction have been reported occasionally, making periodic blood counts and liver-function tests advisable during protracted therapy.

Usual Daily Dosage: Individualize for maximum beneficial effects. *Oral*—Adults: Mild and moderate anxiety and tension, 5 or 10 mg t.i.d. or q.i.d.; severe states, 20 or 25 mg t.i.d. or q.i.d. Geriatric patients: 5 mg b.i.d. to q.i.d. (See Precautions.)

Supplied: Librium® (chlordiazepoxide HCl) Capsules, 5 mg, 10 mg and 25 mg—bottles of 50. Libritabs™ (chlordiazepoxide) Tablets, 5 mg, 10 mg and 25 mg—bottles of 100. With respect to clinical activity, capsules and tablets are indistinguishable.

Dilantin®
(diphenylhydantoin)

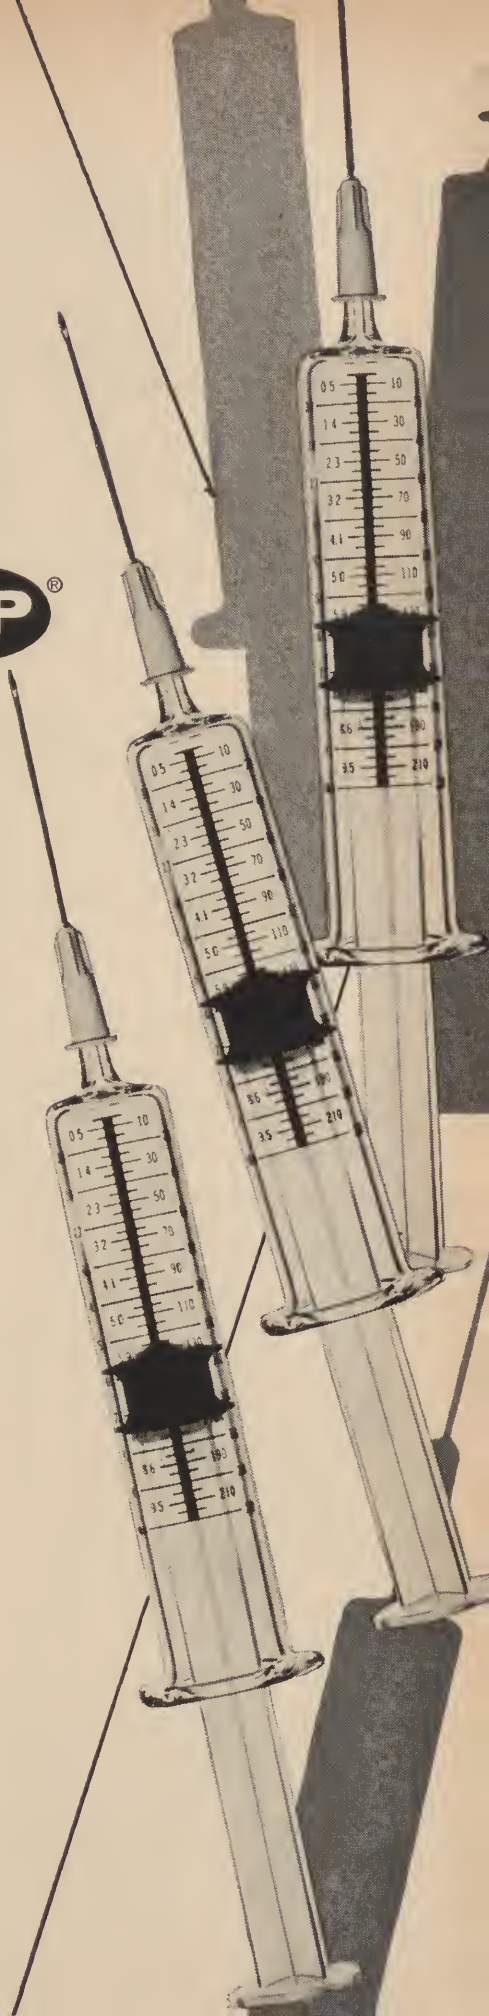
PARKE-DAVIS

In untold thousands of epileptic patients... Dilantin has been, and continues to be, the bedrock of therapy.

DILANTIN is useful in the treatment of grand mal epilepsy and certain other convulsive states. Its use will prevent or greatly reduce the incidence and severity of convulsive seizures in a substantial percentage of epileptic patients, without the hypnotic and narcotizing effects of many anticonvulsant drugs.
PRECAUTIONS: Periodic examination of the blood is advisable. Nystagmus in combination with diplopia and ataxia indicates dosage should be reduced. The possibility of toxic effects during pregnancy has not been explored. ADVERSE REACTIONS: Allergic phenomena such as polyarthropathy, fever, skin eruptions, and acute generalized morbilliform eruptions with or without fever. Rarely, dermatitis goes on to exfoliation with hepatitis, and further dosage is contraindicated. Gingival hypertrophy, hirsutism, and excessive motor activity are occasionally encountered. During initial treatment, side effects may include gastric distress, nausea, weight loss, nervousness, sleeplessness, feeling of unsteadiness. Macrocytosis, megaloblastic anemia, leukopenia, granulocytopenia, thrombocytopenia, pancytopenia, agranulocytosis, and aplastic anemia have been reported. Nystagmus, lymphadenopathy, lupus erythematosus, erythema multiforme (Stevens-Johnson syndrome), and a syndrome resembling infectious mononucleosis with jaundice have occurred.
DILANTIN is supplied in several forms including Kapseals® containing 0.1 Gm. and 0.03 Gm. diphenylhydantoin sodium.
Parke, Davis & Company, Detroit, Michigan 48232

The color combinations of the banded capsules are Parke-Davis trademarks. The orange-banded white capsule identifies Parke-Davis 0.1 Gm. diphenylhydantoin sodium; the pink-banded white capsule 0.03 Gm. diphenylhydantoin sodium.

PARKE-DAVIS 015R67



BSP® DISPOSABLE UNIT

HW&D BRAND OF SODIUM SULFOBROMOPHTHALEIN INJECTION, USP

(50 mg. per ml.)

BSP®

BROMSULPHALEIN® IN A COMPLETE, STERILE, DISPOSABLE, & ECONOMICAL PATIENT-UNIT.

BSP, one of the more valuable single laboratory procedures for determining hepatic function, is now packaged in a complete individual patient-unit.

Each BSP Disposable Unit contains a sterile syringe with the 5 mg./kg. BSP dosage schedule imprinted on the barrel, a sterile needle, alcohol swab and a 7.5 ml. or 10 ml. size ampule of terminally sterilized Bromsulphalein solution.

This all-inclusive disposable put-up lessens the chance of cross-infection and saves time and labor— the most costly commodities.

b.i.d.

The sensible schedule that covers the patient day and night

If your objective in the use of a broad-spectrum antibiotic is prolonged action, with high blood levels, then you know why b.i.d. DECLOMYCIN is considered to be a sensible dosage schedule.

The maintenance dosage of DECLOMYCIN can be kept at this convenient schedule because of its unusually high effective blood and tissue levels.

The b.i.d. dosage of DECLOMYCIN gives you the comfortable assurance that the patient is well-covered, *day and night.*

In clinical practice, blood levels produced by a therapeutic dose of DECLOMYCIN are high, prolonged, and effective; because of high serum binding and slow renal clearance. And if there's a broader susceptibility pattern of organisms, we've yet to see it.

There is no need to give higher daily dosage than 300 mg b.i.d., except in venereal diseases and Eaton Agent pneumonia.

DECLOMYCIN®
DEMETHYLCHLORTETRACYCLINE

Lederle

Prescribing information on next page.

b.i.d. The sensible schedule that covers the patient day and night

DECLOMYCIN Demethylchlortetracycline should be equally or more effective therapeutically than other tetracyclines when the offending organisms are tetracycline-sensitive.

Contraindication: History of hypersensitivity to demethylchlortetracycline.

Warning—In renal impairment, usual doses may lead to excessive accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated, and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort. Necessary subsequent courses of treatment with tetracyclines should be carefully observed.

Precautions—Overgrowth of nonsusceptible organisms may occure. Constant observation is essential. If new infections appear, appropriate measures should be taken. In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment.

Side Effects—Gastrointestinal system—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. Skin—maculopapular and erythematous rashes. A rare case of exfoliative dermatitis has been reported. Photosensitivity; onycholysis and discoloration of the nails (rare). Kidney—rise in BUN, apparently dose related. Transient increase in urinary output, sometimes accompanied by thirst (rare). Hypersensitivity reactions—urticaria, angioneurotic edema, anaphylaxis. Teeth— dental staining (yellow-brown) in children of mothers given this drug during the latter half of pregnancy, and in children given the drug during the neonatal period, infancy and early childhood. Enamel hypoplasia has been seen in a few children. If adverse reaction or idiosyncrasy occurs discontinue medication and institute appropriate therapy.

Average Adult Daily Dosage: 150 mg q.i.d. or 300 mg b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products. Treatment of streptococcal infections should continue for 10 days, even though symptoms have subsided.

In the treatment of syphilis a dosage schedule of a total of 12 to 18 Gm. given in equally divided doses over a period of 10 to 15 days should be followed. Close follow-up observation of the patient is recommended, including appropriate laboratory tests, since demethylchlortetracycline has not had adequate evaluation in all stages of syphilis. Spinal fluid examination should be included as part of this follow-up.

Acute gonococcal anterior urethritis in males has been treated effectively with a single dose of 600-900 mg. of DECLOMYCIN Demethylchlortetracycline. Individuals unable to tolerate large single doses due to gastrointestinal side effects may be treated with 150 mg. every 6 hours for a minimum of 4 doses or 300 mg. every 12 hours for a minimum of 2 doses. Females should be treated with a dosage of 150 mg. every 6 hours or 300 mg. every 12 hours until a cure is effected.

Primary Atypical Pneumonia (Eaton Agent): The average adult daily dosage is 900 mg. in 3 divided doses for six days.

SAN FRANCISCO AMA '68

The excitement of San Francisco's famous sites is waiting for you. Chinatown, the Golden Gate Bridge, Fisherman's Wharf, Telegraph Hill, will add to five memorable and stimulating convention days. Plan to attend now and look forward to an excellent convention in a city of unlimited charm.

Continue your postgraduate education with a varied program of • four General Scientific Meetings on Auto Accidents, Health Care Planning, Infectious Diseases, Treatment of Advanced Malignant Disease • 23 Section Programs • Color Television • Medical Motion Pictures • and over 600 scientific and industrial exhibits. All are designed to bring you up-to-date on what is making medical news today. You will attend lectures by the nation's outstanding medical authorities and discuss with them the significant advances in medicine.

In addition the AMA TV network will present more than 40 hours of convention news.

Reserve now for the Scientific Awards Dinner in honor of the Scientific Award Winners—Wednesday, June 19, 1968. Since space is limited, we suggest you make your reservations before June 3, 1968. Tickets are $10.00 each, payable in advance.

The complete scientific program, plus forms for advance registration and hotel accommodations, will be featured in JAMA, May 6, 1968.

Get fast relief from financial congestion.

Use First National Bank's new Professional Loan program. It takes a lot of money these days to hang out a shingle. Besides the shingle, you need office furniture, diagnostic equipment, and perhaps sophisticated laboratory equipment. Even if you join a colleague who has an established practice, you don't do it for nothing.

Your greatest expense comes at a time when you can probably least afford it. Isn't that always the way it is?

We're sympathetic.

So much so, in fact, that we've created a special new loan program for professional people. It's good for any professional need, any time. Even after years of practice, for example, you may need costly new equipment.

One thing special about this program is the interest rate: a low 4½ percent. Not only that, you can take as long as seven years to repay the loan. This way, you have an operating expense spread over a reasonable time period.

Don't let temporary financial congestion cramp your plans for starting practice or an expensive research effort. We can offer fast, long-lasting relief.

First National Bank of Maryland
where being FIRST makes all the difference.

For further information on this special low-rate Professional Loan: in Baltimore, call SA 7-4000, and ask for Mr. Jack Ortt or Mr. Dave Freese; in Hagerstown, RE 3-6000, Mr. Frank McConell or Mr. Bob La Follette; in Rockville, PO 2-8800, Mr. Walter Clark or Mr. Ray Greenstreet; in Salisbury, PI 2-8143, Mr. Ross Waterman or Mr. Ted Crockett. Or ask any branch manager.

The American Medical Association and the Association of American Medical Colleges announced a joint policy statement calling for a substantial increase in the number of medical students.

Milford O. Rouse, MD, president of the AMA and John Parks, MD, president of the AAMC, reviewed the joint statement at a news conference in Washington.

The statement "emphasized the urgent and critical need for more physicians if national expectations for health services are to be realized." The statement said:

"National policy which would best meet this need, and would be consistent with the American ideal of equal educational opportunity for all, would provide such educational resources that every young person interested in and qualified for entry to the study of medicine would have this opportunity. Both Associations endorsed the position that all medical schools should now accept as a goal the expansion of their collective enrollments to a level that permits all qualified applicants to be admitted. As a nation, we should address the task of realizing this policy goal with a sense of great urgency.

"In their endorsement of and call for broadening educational opportunity for the study of medicine, both Associations stressed that the length of time necessary to realize such a goal does not minimize the need to respond to today's critical shortage of physician manpower. In order to enable the nation's medical schools both to meet today's crisis and to attain the longer-range goal of unrestricted educational opportunity, those responsible for allocation of resources must recognize the magnitude of these tasks."

The two associations said both immediate and long-rang steps should be taken.

The immediate steps are:

1. To increase the enrollment of existing medical schools.
2. To foster curricular innovations and other changes in the educational programs which could shorten the time required for a medical education and minimize the costs.
3. To meet the need for innovation in educational programs and to encourage diversity in the character and objectives of medical schools. The development of schools of quality where a primary mission is the preparation of able physicians for clinical practice as economically and rapidly as possible is to be encouraged. . . .

"A longer-range approach to the need for physicians is the development of new medical schools," the statement said. "This approach will not solve our immediate, urgent need for more physicians but it is essential for meeting the national needs of 1980 and beyond."

The two associations said the longer-range program would require adequate financial support from governmental and various private sources for:

1. Construction of facilities to expand enrollment of existing schools and to create new schools.

TELEPHONE VALET.....

YOUR OWN PRIVATE ANSWERING SERVICE only $99.50

Simply put your phone on "Valet" and connect it to your tape recorder . . . that's all. Crown's "Valet" automatically takes care of all calls while you're away.
At the ring of the call-bell, gives the party calling your message pre-recorded on the endless cartridge tape housed in "Valet." Then the connected tape recorder automatically records his message. Especially designed for use with any type of conventional tape recorder. Accepts about 30 calls with 3" reel.

Complete with tape recorder, $149.95

2. Support of the operational costs of medical schools.
3. Stimulation and incentive for educational innovation and improvement.

"To implement these measures will further require that each medical school and its university re-examine its objectives, its educational program, and its resources to determine how it can contribute mose effectively to the national need for more physicians and what financial help it will need to make this contribution," the statement said. "Also required is understanding by the public, the private foundations, industry, local and state governments, and the national Congress—groups which must provide the financial support which is necessary.

"Initiative for development of new schools and expansion of the established institutions should be locally determined. Only the governing bodies of schools with ongoing programs in medical education can decide to expand such programs. Institutions wishing to organize new medical schools must assume the responsibility for marshalling the necessary support. Both associations are prepared to lend any assistance they can to such efforts."

* * * *

In a health message to Congress, President Johnson proposed control of prices of drugs bought for government programs and asked for authority for the Food and Drug Administration to publish a drug compendium financed by drug manufacturers. He also asked for more money for health manpower and the maternity and child health programs.

With an objective of lowering costs, he also asked for authority for the Health, Education and Welfare Department to establish new formulas for reimbursement of hospitals and physicians under medicare, medicaid and maternal and child health programs. The Social Security Administration immediately announced that it would begin "an experimental program to find methods of reimbursing hospitals and doctors that will have built-in incentives to efficiency and economy."

Participation in such experiments would be entirely voluntary, the SSA said. And Congress would have to approve the necessary legislation before new methods of reimbursement could be put in effect on a mandatory basis.

Under medicare, a physician now is reimbursed on the basis of his usual and customary fee if it is considered reasonable.

HEW said two methods of reimbursement involving physicians that might be tried are:

—Group practice prepayment plans which offer comprehensive health services to their members could be reimbursed on a set per capita rate for the ensuing period.

—For physicians' services, experimental bases of payment might be a single fee related to total illness services rather than individual fees for each individual visit and individual service, agreed-upon fees held stable for specified periods, fees related to physician-time, or retainer or per capita payments per year for services of a specified kind.

Commenting on Mr. Johnson's health message, Dr. Rouse said, "There is great need for expanded health care service in the United States. Meeting this need requires devoting attention to all the elements involved in the supply of resources and manpower, the distribution of health care, and costs.

"The AMA supports private and governmental programs that help those who need help. Health care for all the people should be expanded in an orderly way so resources and needs are

increased together and at comparable rates of growth.

"Government can and should support the construction and renovation of hospitals and extended care facilities, and together with the states and private sources, should promote a rapid increase in medical manpower.

"As for drug prices, we believe that every patient should be able to buy high quality prescription drugs at the lowest possible price. The way to accomplish this is to promote more effective price competition at the retail level, which will result in lower prescription drug prices for everyone. This should be the thrust of government programs—not price fixing for one group. Everyone should be encouraged to be more price conscious in buying prescription drugs. The physician should include both medical and price considerations in writing prescriptions and the patient should patronize that pharmacy that can furnish dependable service and the prescribed product at the lowest possible price. . . .

"The President's message contains little essentially new. It concentrates again on pouring additional millions of dollars into a health care system that is already facing requirements well beyond what it can now meet.

"Government expenditures for health care should be moderated during this period of acute shortage to control rapidly rising cost. Government can be most helpful by controlling inflation and by providing tax deductions and credits for people purchasing health insurance. . . .

"The physicians of this country will welcome a genuine partnership in health, where the Federal government will sincerely and continually seek the advice and active collaboration of those whose special services lie in medical education and the planning and provision of superior quality medical care for all citizens."

* * * *

The Board of Medicine of the National Academy of Sciences stated that the transplantation of human hearts still is in the experimental stage and proposed three guidelines for the procedure.

The Board said human cardiac transplantation should only be carried out in institutions in which these three criteria can be met:

1. The transplant teams should be highly skilled and have had extensive laboratory experience.
2. The work should be carefully planned, and the results should be rapidly communicated to others in the field.
3. Both the teams and the patients should be protected by "rigid safeguards."

* * * *

A check is being made to determine how many alien physicians, dentists and "allied specialists" are now subject to draft laws. A new law for the first time makes aliens in the medical and dental professions subject to draft up to age of 35.

* * * *

President Johnson asked Congress for $571.7 million more for medicaid for the 1968 fiscal year ending July 1, 1968.

The administration said the initial appropriation proved inadequate because of a complete lack of data and experience as to costs of such a program and a larger increase than expected in costs of hospital and other medical care.

A TRUST IS A TRUST. AND WE NEVER FORGET IT.

Never.

Our Trust Division is, first, a family business. Several thousand families rely on our competence in estate management for their security. That's a pretty basic and very vital reason for the professional competence and depth of the specialists on our Trust Department Staff.

But we're also in business with business. Corporate Pension and Profit-Sharing Plans are coming to us in ever-growing numbers. And for the same reasons that individuals do —their funds have to be protected and nurtured, too.

Both groups must feel that Mercantile offers them better protection and surer growth than any other bank in the Southeast. Perhaps they find it significant that Mercantile, one of the oldest banks in the South, was also the first to be fully automated. And today we manage in our Trust Department assets in excess of $2½ billion.

Very few banks in the country can match that statement.

The muscle relaxant that works before you write a prescription

Relieve painful skeletal muscle spasm in your office in minutes with a single 2 cc. injection of NORFLEX. Then, for sustained relief, write a prescription for NORFLEX tablets, 1 tablet b.i.d.

CONTRAINDICATIONS: Due to its anticholinergic action, NORFLEX should not be used in patients with glaucoma, pyloric or duodenal obstruction, stenosing peptic ulcer, prostatic hypertrophy or obstruction at the bladder neck, cardiospasm (megaesophagus) and myasthenia gravis. Use with caution in patients with tachycardia. Do not use propoxyphene (Darvon*) concurrently.

WARNING: Transient lightheadedness or dizziness following NORFLEX-INJECTABLE may occur.

SIDE EFFECTS: Due mainly to anticholinergic action and usually at high dosage. They may include dryness of the mouth, tachycardia, palpitation, urinary hesitancy or retention, blurred vision, dilatation of the pupil, increased ocular tension, weakness, nausea, vomiting, headache, dizziness, constipation, and drowsiness. Infrequently, mental confusion in the elderly, urticaria or other dermatoses. Side effects are usually eliminated by reduction in dosage. Two cases of aplastic anemia, with no established causal relationship, have been reported.

DOSAGE: **INJECTABLE** — Average adult dose: one ampul, 2 cc. (60 mg. orphenadrine citrate) I.M. or I.V. May be repeated every 12 hours. Relief may be maintained with one NORFLEX tablet b.i.d. **TABLETS** — Two tablets per day for adults, one in the morning, one in the evening. Each tablet contains 100 mg. orphenadrine citrate.

For full information, see Package Insert or P.D.R.

EXECUTIVE SECRETARY'S NEWSLETTER

April, 1968

EDUCATIONAL MAIL-IN

Enthusiastic response was made by Maryland physicians to the offer of pamphlets for their patients on subjects of the physician's choice. More than 6000 postal cards have been mailed out to physicians for their distribution to their patients as needed.

Geared to save the busy physician's time, the method provides an easy mechanism for patients to receive authoritative material on subjects of concern to them.

For those physicians who have not taken advantage of this offer, a telephone call or note to the Faculty office will provide information or a supply of postal cards.

BANK CHARGE CARDS

The use of "Bank Charge Cards" by physicians for billing to their patients is considered unethical by both the AMA and the Faculty.

Telephone calls have been received at the Faculty office indicating that Faculty approval has been granted to use such services. This is incorrect.

NEWS NOTES

Hans R. Wilhelmsen, M.D., D.D.S., has been certified a Diplomate of the American Board of Plastic and Reconstructive Surgery.

George Edwards, M.D., Baltimore, spoke before the PTA of the Waverly Elementary School as part of the continuing program on eye education sponsored by the Maryland Society for the Prevention of Blindness.

AMA QUESTIONNAIRE

The March 25 issue of AMA News will include a Physician Activity Verification Questionnaire which should be completed and returned to the AMA. Your cooperation is asked in completing and returning this questionnaire.

LEGISLATIVE NEWSLETTER

The final issue of The Assemblyman, the Faculty's Legislative Newsletter, is being mailed during the next week or so. This will contain a complete rundown on activity at the General Assembly during the 1968 session.

A complete listing of bills and their fate will be included in this issue. Those persons interested in being alerted to any hearings on bills that have been referred to the Legislative Council should let the Faculty office know so that this data can be conveyed to those who wish the opportunity to be heard.

TELEPHONE CLASSIFIED BILLS

Physicians are again reporting they are receiving bills designed to give the impression they are for a classified or "yellow page" telephone listing. These originate from California and on occasion physicians have sent in checks to cover the item indicated.

This is similar to a scheme conducted throughout the state last year in which business as well as professional persons were solicited in this manner.

Charges for yellow page listings are included in the regular C & P Telephone Company monthly bills.

PERSONALITIES

David P. Mohr, M.D., has opened his office for the practice of Ophthalmology at 10 East Chase Street, Baltimore.

A. F. Abdullah, M.D., has relocated his office at 318 N. Potomac Street, Hagerstown, for the practice of Neurological Surgery.

Charles S. Rafky, M.D., has opened his office for the practice of Psychiatry at 1010 St. Paul Street, Baltimore.

Book Reviews

NEW DRUGS 1967 edition Evaluated by AMA Council on Drugs, American Medical Association, 525 N. Dearborn St., Chicago, Ill. 60610.

The physician must have readily available sources of balanced, authoritative information in order to cope effectively with the complexities of modern pharmacotherapy. *New Drugs*, a publication of the AMA Council on Drugs, now in its third edition, provides such information on new drugs.

The 1967 edition of *New Drugs* is a compilation of introductory statements on various therapeutic classes of drugs and monographs on single-entity drugs marketed in the United States during the period 1957-1966. It contains 265 individual drug monographs, each of which gives information on the actions and uses of the drug and its adverse reactions, contraindications or precautions, dosages and routes of administration, and sizes and strengths of available preparations. The introductory statements to 21 chapters have been throughly revised and 10 new monographs have been added. These monographs and introductory statements are based on a thorough review and evaluation by the Council of Drugs and its consultants of all of the laboratory and clinical information, including unpublished data, available to them. Thus, the book presents a concise, unbiased assessment of the newer drugs within the perspective of the therapeutic application of all of the commonly used agents in a particular class of drugs. Since a monograph on a drug is included whether or not the Council's opinion is favorable, *New Drugs* is in no sense a list of approved or accepted drugs.

The index lists drugs by both their nonproprietary (generic) and trade names and includes therapeutic entries. A list of Canadian trade names equivalents is given in the appendix.

DRUGS OF CHOICE, 1968-69; Walter Modell, MD; The C V Mosby Company, Saint Louis, Mo.

This new edition of a practical guide to the selection of the best drug for a particular therapeutic problem has a distinguished list of contributors.

Recent legal and quasi-legal actions of the FDA have created new and special problems and responsibilities for the practitioner and these are discussed in detail in the introduction.

This aspect alone warrants the purchase of this book by the practitioner who will find great assistance from it being at his elbow for consultation.

PRINCIPLES OF NUCLEAR MEDICINE, Henry N. Wagner, MD; W. B. Saunders Company, Philadelphia, Pa.

This book has an impressive list of outstanding and knowledgeable contributors listed in it. This, no doubt, adds to the quality of the material presented.

Throughout the book an attempt has been made to present the techniques of nuclear medicine in light of the diagnostic problem at hand. Since the breadth of the field makes it difficult for one person to be knowledgeable in all areas, opinions and assistance was sought from the contributors.

This book will serve as a text for the student and as a reference for the specialist; it can be used for fundamental as well as advanced training in the clinical and research applications of radioactive tracers.

What can be done for Susan Jane To stop the runs and crampy pain?

Parepectolin for quick relief of acute diarrhea
...soothes colicky pain with paregoric
...consolidates fluid stools with pectin
...adsorbs irritants with kaolin, and protects intestinal mucosa.

In children, Parepectolin may be used to control diarrhea promptly and prevent dehydration, until etiology has been determined. In some cases, Parepectolin may be all the therapy necessary.

Parepectolin®

Each fluid ounce of creamy white suspension contains:
Paregoric (equivalent).....(1.0 dram) 3.7 ml.
Contains opium (¼ grain) 15 mg. per fluid ounce.
warning: may be habit forming
Pectin ..... (2½ grains) 162 mg.
Kaolin (specially purified)....(85 grains) 5.5 Gm.
(alcohol 0.69%)
Usual Children's Dose: One or two teaspoonfuls three times daily.

ROER RORER

WILLIAM H. RORER, INC.
Fort Washington, Pa.

Don't let monilia cut broad-spectrum therapy short...

start with Tetrex-F®

tetracycline phosphate complex-nystatin

Use of broad-spectrum antibiotics can cause fungal overgrowth in the alimentary tract... and give rise to symptoms so troublesome that therapy must be prematurely stopped. Tetrex-F (tetracycline phosphate complex-nystatin) helps you circumvent this problem.

The nystatin can prevent overgrowth of monilia; the phosphate complex delivers tetracycline to the blood rapidly. Side effects are infrequent.

High-Risk Patients

Tetrex-F (tetracycline phosphate complex-nystatin) is especially useful in patients most susceptible to fungal overgrowth during tetracycline therapy: (1) the elderly or debilitated, (2) young children, (3) the diabetic, (4) those on long-term tetracycline therapy, (5) those on steroid therapy, (6) those who have had moniliasis before, and (7) pregnant patients with a history of monilial vaginitis.

When you start with economical Tetrex-F (tetracycline phosphate complex-nystatin), you can complete the full course of broad-spectrum therapy with less chance of losing control elsewhere. A good start for a healthy finish.

PRESCRIBING INFORMATION. For complete information consult Official Package Circular. *Indications:* Infections of respiratory, gastrointestinal and genitourinary tracts and skin and soft tissues due to tetracycline-sensitive organisms, in patients with increased susceptibility to monilial infections. *Contraindications:* The drug is contraindicated in patients hypersensitive to its components. *Warnings:* Photodynamic reactions have been produced by tetracyclines. Natural and artificial sunlight should be avoided during therapy. Stop treatment if skin discomfort occurs. With renal impairment, systemic accumulation and hepatotoxicity may occur. In this situation, lower doses should be used. Tooth staining and enamel hypoplasia may be induced during tooth development (last trimester of pregnancy, neonatal period and childhood). *Precautions:* Bacterial superinfections may occur. Infants may develop increased intracranial pressure with bulging fontanels. In gonorrheal therapy, serologic tests for syphilis should be conducted initially and monthly for 3 months. *Adverse Reactions:* Glossitis, stomatitis, nausea, diarrhea, flatulence, proctitis, vaginitis, dermatitis, and allergic reactions may occur. *Usual Adult Dosage:* 1 capsule q.i.d. Continue for 10 days in Beta-hemolytic streptococcal infections. Administer one hour before or two hours after meals. *Supplied:* Capsules, bottles of 16 and 100. Each capsule contains tetracycline phosphate complex equivalent to 250 mg. tetracycline HCl activity and 250,000 units of nystatin. For Oral Suspension, 125 mg. tetracycline and 125,000 u. nystatin/5 ml., 60 ml. bottles.

BRISTOL

BRISTOL LABORATORIES
Division of Bristol-Myers Company
Syracuse, New York 13201

The AMA'S Convention Services Department:

Its Staff of "Hotel Circuit" Veterans Strives to Bring You Maximum Comfort and Productivity at Medical Meetings

Whether you're an official program participant or a registrant seeking to capitalize on what the medical program has to offer, you expect all to be in "shipshape" condition when you attend the American Medical Association's Annual or Clinical Convention or any of more than 100 other major meetings it sponsors annually.

Quietly but efficiently working behind the scenes is the AMA's Convention Services Department, a staff of four seasoned "hotel circuit" veterans. Thanks to their savvy, long-range planning, and continuing reviews, you are assured of obtaining the best possible accommodations and most desirable arrangements for your meetings and at the most favorable rates. Also, you don't have to be harried with working out the tedious and often expensive details which confront most visitors operating independently in a strange city during a peak period.

Through the efforts of the staff myriad details are carefully coordinated to achieve a precise, orderly operation in the scientific and industrial exhibit area, the scientific sessions, House of Delegates meetings and other official convention meetings, plus the most effective housing procedure for all concerned.

Right now, for instance, you may be on the verge of deciding whether to attend the AMA's 117th Annual Convention, June 16-20, in exciting San Francisco.

But to members of the Convention Services Department staff that Convention, to a large degree, is now history. They've been working out the intricate planning details since the 1964 Annual Convention in San Francisco closed.

"Few events can tie up a city worse than a huge convention like the AMA presents," points out Wayne Burmeister, department director. "It's especially difficult in an extremely popular tourist city like San Francisco where space always is at a premium. That's why we started so soon in working out details for the 1968 convention."

Despite the early start, however, and excellent cooperation from the Housing Bureau there, there is still a shortage of space. Since negotiations began, one contracted hotel has closed and another has gone "residential."

Consequently, only 8,200 rooms have been committed—1,800 less than the 10,000 used in 1964—creating a space problem which defies a practical solution. In obtaining those rooms hundreds of hotels were inspected by the staff, but only 120 met the required standards. Housing at these approved facilities is handled through the San Francisco Housing Bureau on a "first-come, first-served" basis. An additional 3,500 new hotel rooms are expected to be available there during the 1972 AMA Convention. Everyone looks forward to this reduced housing pressure.

Since the AMA's Annual Conventions attract up to 70,000 registrants, they are the most time-consuming meetings for which to plan, but working out arrangements is less complicated since only the four present sites—San Francisco, New York, Chicago and Atlantic City—have ample, centrally located exhibit and hotel space, plus

other desired services and features needed to handle them.

With other meetings it is a different story. The Board of Trustees already has scheduled Annual and Clinical Convention sites through 1974. Competition among cities wishing to vie as sites for future meetings is becoming increasingly keen. By 1975 at least a half-dozen more cities will have ample facilities to host the Clinical Convention.

In 1967 the department set up 164 future ancillary meetings and handled an additional 137 held that year. This involved working up complete housing, meeting, catering and other essential arrangements for more than 10,300 people—exclusive of the Annual and Clinical Convention totals.

In keeping pace with this hectic activity, members of the department naturally have become experts in the field. Members of the staff travel extensively (about 25% of their time) to conduct their on-site inspections, to study new or proposed hotel and exhibit hall developments and to establish contracts and agreements. It requires constant checking and rechecking because situations and circumstances can change rapidly. A hotel that was noted for its top service a couple of years ago may be the town's "lemon" today—or tomorrow. In meeting its obligation to physicians the staff must know hotels from coast to coast like a book.

Its members strive to see that you have no problems when you arrive at your Convention or meeting location so that you and your guests have a pleasant, comfortable stay while enabling you to further your medical knowledge.

Because of its advance planning, Conventions and meetings run smoothly and whatever you need is on hand, or can be obtained readily. As many as 150 part-time employees are hired locally to provide these services, some of which are required on a 24-hour basis. From AMA headquarters alone, 175 or more employees are on location to help staff the conventions and take care of the more than 300,000 pounds of freight shipped to meet required service or programming needs.

To further serve guests an Information Center is operated and staffed by knowledgeable people who can answer your questions. At the 1967 Annual Convention in Atlantic City, members of this staff answered more than 16,000 questions posed by registrants. That included Information Center facilities at the main center in the exhibit hall, the main floor information depot, the scientific area depot, the message center, telephone center and special stations along the Boardwalk.

A simplified approach to the practical management of hypertension

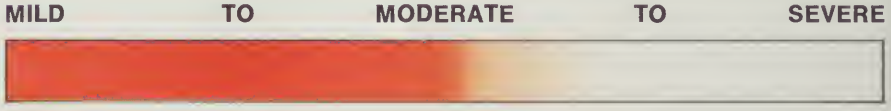
Enduron: (methyclothiazide) A basic building block for mild hypertensives

Excellent day-long Na^+ output, yet easy on the K^+

Enduron provides an excellent starting therapy. Your patient's sodium excretion is greatly enhanced. Yet potassium loss is low.

The therapeutic action is smooth, and persists for a full 24 hours. With Enduron you can prescribe convenient once-a-day dosage without skimping your patients on day-long thiazide effectiveness.

Of course, as with all thiazides, supplemental dietary potassium should also be considered.



Use Enduron as a basic therapy in patients with mild to moderate hypertension. A single 5-mg. tablet each day is ample in most cases.

Once a day, every day

ENDURON®

METHYCLOTHIAZIDE

MILD TO MODERATE TO SEVERE

See Brief Summary on final page of advertisement

Enduronyl: Its deserpidine component adds response in moderate hypertension

Less frequent rauwolfia side effects than with reserpine

When you wish to build further response, consider shifting to Enduronyl.

Enduronyl adds a building block of *deserpidine*. This is a purified rauwolfia alkaloid available only from Abbott. It adds good antihypertensive and tranquilizing activity. Yet its incidence of untoward effects, particularly lethargy and depression, is lower than with reserpine.

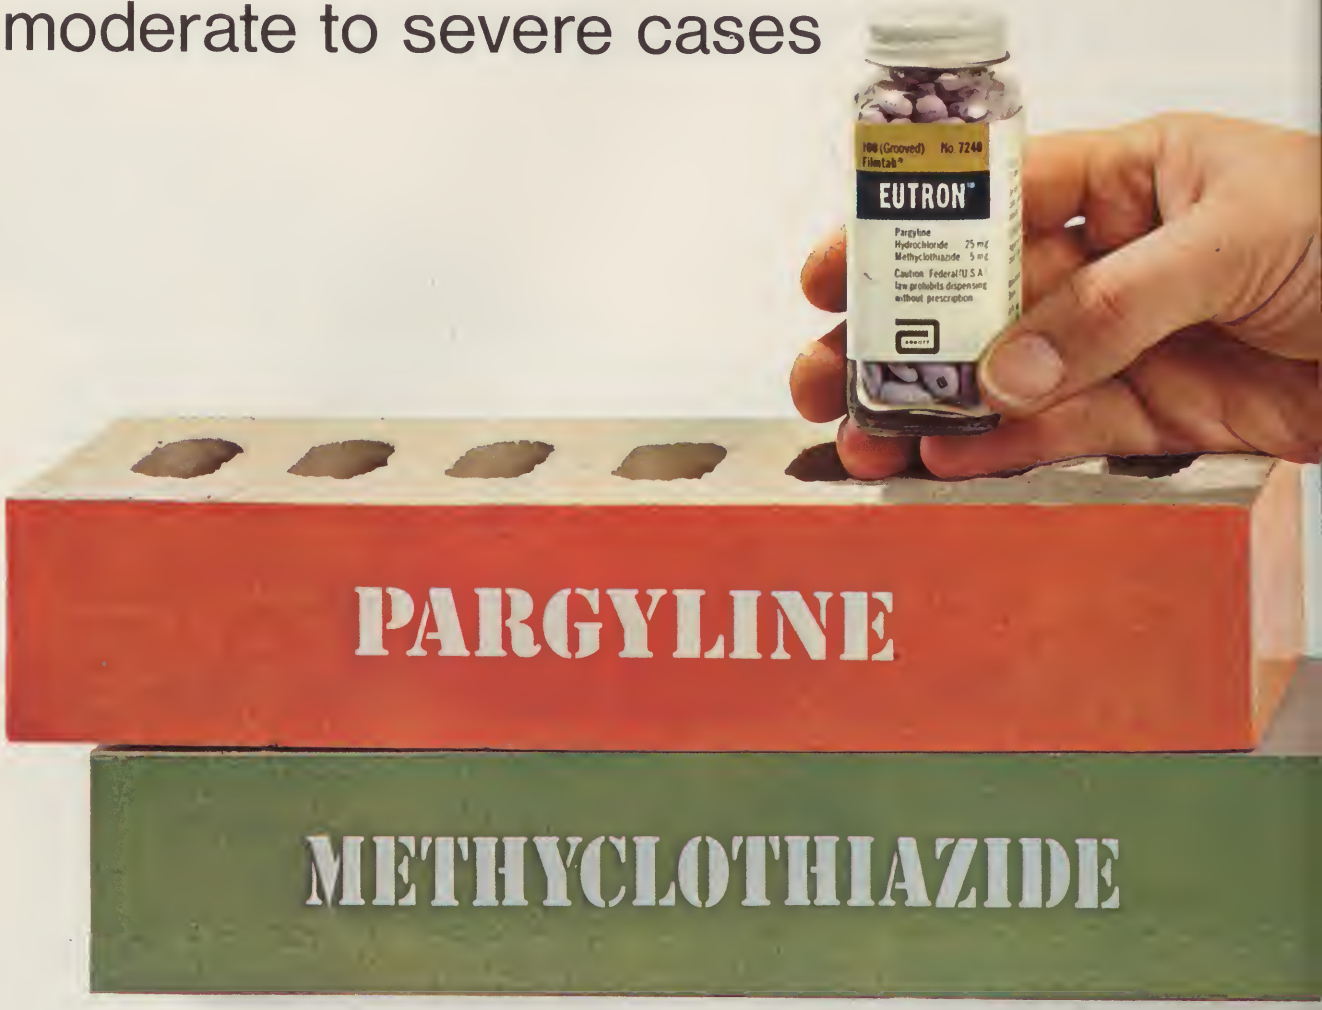
Enduronyl is available plain or Forte. The latter provides its variation where most helpful, by doubling the deserpidine.

Use Enduronyl for patients throughout the broad range of mild to moderately severe hypertension.

Once a day, every day

ENDURONYL®

METHYCLOTHIAZIDE 5 mg. with DESERPIDINE 0.25 mg. or (FORTE) 0.5 mg.



MILD TO MODERATE TO SEVERE

See Brief Summary on final page of advertisement

801094

Eutron: A unique combination for handling moderate to severe cases

Affords almost uniform diastolic reduction in all body positions

Eutron lowers diastolic pressures nearly equally, whether your patient is standing up or lying down.

Thus, in clinical trials, average *standing* diastolic readings were reduced from 112 pre-treatment to 90 post-treatment; *sitting* from 115 to 95; and *recumbent* from 112 to 94.

Note that following Eutron, the diastolic reductions were nearly alike in all three body positions.

Use Eutron for managing your moderate to severe cases. Its building blocks enhance each other; hence lesser doses often suffice.

Once a day, every day

EUTRON™

PARGYLINE HYDROCHLORIDE 25 mg.
with METHYCLOTHIAZIDE 5 mg.

MILD TO MODERATE TO SEVERE

See Brief Summary on final page of advertisement

801094

ENDURON® | ENDURONYL®

METHYCLOTHIAZIDE

Each tablet contains
Methyclothiazide 5 mg. with
Deserpidine 0.25 mg. or 0.5 mg.

Indications: Edema and mild to moderate hypertension (Enduron), and mild to moderately severe hypertension (Enduronyl). More potent agents, if added, can be given at reduced dosage.

Contraindications: Sensitivity to thiazides; severe renal disease (except nephrosis) or shutdown; severe hepatic disease or impending hepatic coma (hepatic coma due to hypokalemia has been reported in patients on thiazides). Do not use Enduronyl in severe mental depression, suicidal tendencies, active peptic ulcer, or ulcerative colitis.

Warnings: Consider possible sensitivity where there is history of allergy or asthma. If added potassium is indicated, dietary supplementation is recommended. Reserve enteric-coated potassium tablets for cautious use only when necessary, as they may induce serious or fatal small bowel lesions (stenosis with or without ulceration), cause obstruction, hemorrhage, and perforation often requiring surgery; discontinue them immediately if abdominal pain, distention, nausea, vomiting, or g.i. bleeding occurs. Neither Enduron nor Enduronyl contains added potassium.

Precautions: Use thiazides cautiously in severe renal dysfunction, Impaired hepatic function or progressive liver disease; also in pregnancy (bone marrow depression, thrombocytopenia, and altered carbohydrate metabolism have been reported in certain newborn). In surgery, thiazides may reduce response to vasopressors, and increase response to tubocurarine. Antihypertensive response may be enhanced following sympathectomy. Watch for electrolyte imbalance (e.g., hyponatremia) in all patients. In hypokalemia (especially in digitalized patients) give supplemental potassium. In hypochloremic alkalosis, give supplemental chloride.

Use rauwolfias with caution in patients with history of peptic ulcer. Rauwolfias with anesthetics may produce hypotension and bradycardia. Discontinue Enduronyl two weeks before elective surgery. Consider vagal blocking agents during emergency surgery. In epilepsy, adjust anticonvulsant dosage. In electroshock, shorten stimulus strength and duration. In occasional patients with depressive tendencies, rauwolfias may precipitate severe mental depression that usually disappears when drug is stopped.

Adverse Reactions: Thiazide reaction include blood dyscrasias (thrombocytopenia with purpura, agranulocytosis, aplastic anemia); elevation of BUN, serum uric acid or blood sugar; anorexia, nausea, vomiting, diarrhea, headache, dizziness, paresthesia, weakness, skin rash, photosensitivity, jaundice, symtomatic gout, and pancreatitis. Cutaneous vasculitis in the elderly has been reported with other thiazides. Adverse effects with deserpidine are qualitatively similar to those with reserpine, but their incidence is lower. These include nasal stuffiness, abdominal cramps or diarrhea, nausea, headache, weight gain, reduced libido and potency, peptic ulcer aggravation, epistaxis, skin eruption, asthma in susceptible patients, electrolyte imbalance, excessive salivation, and a reversible Parkinson's syndrome. Excessive drowsiness, fatigue, weakness, and nightmares may signal mental depression. Thrombocytopenia, purpura, and a symptom manifested by dull sensorium, deafness, uveitis, glaucoma, and optic atrophy are rare allergic reactions to other rauwolfias. Hypotension from antihypertensive agents may precipitate angina attacks in susceptible individuals. Usually adverse reactions disappear when drug is withdrawn.

EUTRON™

Each tablet contains
Pargyline Hydrochloride 25 mg.
with Methyclothiazide 5 mg.

Indications—Moderate to severe hypertension.

Contraindications—Pheochromocytoma, paranoid schizophrenia, hyperthyroidism and advanced renal failure. Not recommended in malignant hypertension, children under 12, pregnant patients.

Do not use with: centrally or peripherally acting sympathomimetic drugs; foods high in tyramine (e.g., aged and natural cheeses); parenteral reserpine or guanethidine; imipramine, amitriptyline, desipramine, nortriptyline or their analogues; other monoamine oxidase inhibitors; methyldopa or dopamine; separate Eutron and these agents by two weeks.

Sensitivity to thiazides; severe renal disease (except nephrosis) or shutdown; severe hepatic disease; impending hepatic coma from thiazide-induced hypokalemia.

Warnings—Patients: 1. No other drugs (particularly "cold preparations" and antihistamines), cheese or alcohol without physician's consent. 2. Promptly report orthostatic symptoms, severe headache, other unusual symptoms. 3. Angina pectoris or coronary artery disease patients must not increase physical activity with improved anginal symptoms or well-being.

Physicians: 1. Use antihistamines, hypnotics, sedatives, tranquilizers and narcotics (meperidine contraindicated) cautiously in reduced doses. 2. Stop Eutron two or more weeks before elective surgery; in emergency surgery reduce premedication (narcotics, sedatives, analgesics, etc.) to 1/4 to 1/5; carefully adjust anesthetic dosage to patient response. 3. Use cautiously in advanced renal failure. 4. Pargyline may induce hypoglycemia. 5. Consider possible sensitivity reactions when a history of allergy or asthma is present. 6. If potassium is indicated, dietary supplement is recommended; enteric-coated potassium tablets may induce serious or fatal small bowel lesions (stenosis with or without ulceration), cause obstruction, hemorrhage, and perforation frequently requiring surgery; discontinue medication immediately if abdominal pain, distention, nausea, vomiting or gastrointestinal bleeding occurs; Eutron does not contain added potassium. 7. Possible systemic lupus erythematosus has been reported for thiazides.

Precautions—Pargyline: Use cautiously at reduced dosage; caffeine, alcohol, antihistamines, barbiturates, chloral hydrate, other hypnotics, sedatives, tranquilizers, narcotics. Periodically do urinalyses, blood counts, liver function tests, etc. Use with caution in liver disease. Watch for orthostatic hypotension, especially in impaired circulation (e.g., angina pectoris, coronary artery disease, cerebral arteriosclerosis); also, augmented hypotension in concomitant febrile illnesses. Reduce or discontinue if hypotension is severe. In impaired renal function watch for cumulative drug effects, elevated BUN and other evidence of progressive renal failure; withdraw drug if these persist. In surgery increased central depressant response (hypotension and increased sedative effect) can be controlled by (1) discontinuing at least two weeks prior; (2) in emergency surgery lowering dose of premedication; (3) when necessary, administering a vasopressor. Do not use in hyperactive and hyperexcitable patients. Pargyline may unmask severe psychotic symptoms where emotional problems pre-exist. Use cautiously in Parkinsonism, especially with antiparkinsonian agents. In prolonged therapy, examine for change in color perception, visual fields, fundi and visual acuity. Also, prolonged therapy has made certain patients refractory to nerve blocking effects of local anesthetics.

Methyclothiazide: Use cautiously in severe renal dysfunction, impaired hepatic function or progressive liver disease; also in pregnancy (bone marrow depression, thrombocytopenia, and altered carbohydrate metabolism have been reported in certain newborn). In surgery thiazide may reduce vasopressor response and increase tubocurarine response. Antihypertensive response may be enhanced following sympathectomy. Watch for electrolyte imbalance (e.g., hyponatremia). Give supplemental chloride if hypochloremic alkalosis occurs and supplemental potassium if hypokalemia occurs (especially in digitalized patients). Thiazides may decrease serum P.B.I. without signs of thyroid disturbance.

Adverse Reactions — Pargyline: Orthostatic hypotension and associated symptoms, mild constipation, fluid retention, edema, dry mouth, sweating, increased appetite, arthralgia, nausea, vomiting, headache, insomnia, difficult in micturition, nightmares, impotence, delayed ejaculation, rash, purpura, weight gain, hyperexcitability, increased neuromuscular activity and other extrapyramidal symptoms. Drug fever is extremely rare. Reduction in blood sugar and hypoglycemic effects are possible. Congestive heart failure has been reported in a few patients with reduced cardiac reserve.

Methyclothiazide: Blood dyscrasias (thrombocytopenia with purpura, agranulocytosis, aplastic anemia); elevation of BUN, blood sugar or serum uric acid (gout may be induced); anorexia, nausea, vomiting, diarrhea, headache, dizziness, paresthesia, weakness, skin rash, photosensitivity, jaundice and pancreatitis. Cutaneous vasculitis in elderly patients has been reported with other thiazides.

If side effects are severe or persist, reduce dosage or withdraw drug. 804438R

101 reasons why you should buy the UHER 4000-L now

The first 100 reasons are the dollars you'll save during UHER's "Own the Best" special. The price is $340 instead of $440. . . . The 101st reason is —QUALITY! The 4000-L is the world's finest tape recorder—solid state, seven pounds light, operates on rechargeable or regular batteries, records and plays back on four speeds. It's the choice of professionals . . . explorers, reporters, doctors and lawyers.

Audio Magazine calls the UHER 4000-L "Magic in a Matchbox." Professionals call it the greatest. . . . Save $100 now. Bring in this ad, and walk out with 7 pounds of greatness.

Save $100

Upon presentation of this coupon to any UHER dealer, the bearer may purchase the world-famous UHER 4000-L tape recorder at the special price of $340. (Regular price $440.) This unique "Own the Best" offer includes the following accessories:

Dynamic microphone with built-in wind screen, music/speech switch (#M 514) • Long-life Accumulator dry-fil battery pack (#433) • AC power supply and battery charger (#880) • Genuine leather carrying case (#861)

Offer expires June 15, 1968, and is applicable only on the UHER 4000 Report-L Tape Recorder

The AMA'S Department of Investigation:

It Serves You and the Public

When the American Medical Association was founded 121 years ago as a means of propelling American medicine out of its then "Dark Ages," one of its chief goals was to protect the public from health quacks, charlatans and pretenders.

If those concerned early-day physicians could somehow be given a miraculous glimpse into the 1960's, they might be disheartened, but perhaps not surprised to find that their lofty goal of driving quackery into everlasting oblivion has not yet been reached.

Although great strides have been made against quackery through the years, the battle is far from won. Because of man's inherent weaknesses, quackery most likely never will be completely uprooted. Unfortunately for both man and medicine, the glib, fast-footed quack too often is as adaptable as a chameleon in his relentless, yet often lucrative struggle for survival.

Spearheading the unremitting attack against the many ruthless forms of health quackery that endanger health and bilk victims of an estimated billion dollars a year is the AMA's Department of Investigation, which has many powerful allies in its vigilant quest.

Chief among them are the Food and Drug Administration, Post Office Department, Federal Trade Commission, National Better Business Bureau, American Pharmaceutical Association, American Cancer Society, Arthritis Foundation and numerous other public and private agencies, including all law enforcement bodies.

Serving as a clearing house for information on quackery, pseudo medicine and nostrums, the Department of Investigation's staff of 11 persons has meticulously amassed and catalogued the most extensive files available on quackery. These files are used daily in exposing quacks.

Since quacks and other medical pretenders are quite clever and so changeable in their methods, the staff is constantly on the alert for new guises as well as the old. Although the department has no law enforcement powers, much of the information it gathers, through state and local medical societies and through its own initiative, is used by federal, state, local and foreign law enforcement agencies and state licensing agencies to prosecute offenders.

One of its key roles is to alert regulatory agencies when circumstances point to the likelihood that the laws which such agencies are obliged to enforce are being violated.

The department, created in 1906, is the brainchild of the late Arthur Cramp, MD, who, as associate editor of the *Journal of the American Medical Association,* started what was then called the Department of Propaganda for Reform in Advertising of Patent Medicines. Doctor Cramp was a most effective campaigner.

In that era, inquiries concerning quackery came primarily from physicians. That was the heyday of nostrums blatantly promising cures of diabetes or cure and alleviation of such conditions as tuberculosis, venereal disease and diphtheria. Most such nostrums, through regulatory action, have faded from the scene, being replaced by more timely "wonder cures."

Today's "merchants of menace" have adapted to the times, finding that their livelihood is greatly enhanced by such phony, but readily salable wares as baldness cures, sea water products, insomnia treatments, breast developers, cancer cures, useless vitamins, height increasers, all-purpose spinal adjustments and cures for the tobacco habit.

Since health education of the public is mandatory to thwart exploitation of the fearful, sick and the retarded, many of the department's efforts in recent years have been concentrated in this area with increasingly productive results. Widely diversified literature, exhibits and films—all part of this positive AMA program—have spurred greater public understanding of quackery and its evils. Today the majority of the thousands of inquiries annually directed to the department originate from the public.

Numerous quacks have been driven out of their thriving "practices" because of greater public understanding and coordinated efforts on the part of the AMA, medical societies and agencies equally concerned with the problems. Many of their phony products no longer are marketable. Other quacks, although still plying their trade, have been forced into exile by the close watch of

regulatory bodies.

Cancer "cures" such as the liquid and pills concocted by the late "Dr." Hoxsey, "gregomycin," which was conveniently unearthed from the backyard of another medical pretender and the more recent "krebiozen" have disappeared from the scene because of professional surveillance and ensuing regulatory action.

Thanks to quick action by the AMA, the Ohio State Medical Society and the Cleveland Academy, along with regulatory bodies, another alleged cancer cure, the "Rand vaccine" was halted before it had a chance to "make a name for itself" by creating false hopes. After initial publicity in the lay press, cancer victims from throughout the world flocked to Cleveland to obtain this substance. Another potential "krebiozen" fiasco was avoided when a federal district court ultimately barred both the manufacture and distribution of the substance.

Hard times are falling on other impostors through similar action, such as Antonio Agpaoa, the self-styled "psychic surgeon" of the Philippines who has specialized in treating Americans. Alerted by the AMA, the U. S. State Department, Philippine Medical Association and government agencies are keeping a close eye on the situation. A group of more than 100 Detroit hopefuls recently visited Agpaoa. His "treatment" was branded as a "cruel hoax" upon their return.

Inroads also have been made against "dipyrone," a dangerous drug being dispensed across the border by Mexico physicians. Several deaths occurred among arthritis sufferers in several Southern states before Louisiana physicians, the AMA and others could determine the cause and issue public warnings.

In Tijuana, Mexico, still more cancer "cures" have sprouted. Despite public warnings, however, a ready supply of hopeful patients is available. As a "service" to these patients, free bus service from California is provided. Their cancer treatment in Tijuana? Drugs found to be worthless by U. S. authorities.

In the meantime, the AMA, through the Department of Investigation and other arms, is utilizing every weapon at its command to halt the spread of quackery.

And, you, as a physician, can do your part by keeping in touch with the Department of Investigation and making good use of the services and the educational literature which it has developed for the benefit of the profession and the public.

anticostive* hematinic

PERITINIC®

Hematinic with Vitamins and Fecal Softener

A tablet-a-day provides:	
• Elemental Iron (as Ferrous Fumarate)	100 mg
• Dioctyl Sodium Sulfosuccinate (to counteract constipating effect of iron)	100 mg
Vitamin B_1	7.5 mg
Vitamin B_2	7.5 mg
Vitamin B_6	7.5 mg
Vitamin B_{12}	50 mcgm
Vitamin C	200 mg
Niacinamide	30 mg
Folic Acid	0.05 mg
Pantothenic Acid	15 mg

Bottles of 60

* anticostive, *adj.* (*anti* opposed to + *costive* causing constipation.) Against constipation. (Now isn't that a good idea in an iron-containing hematinic? We'll send you samples if you'll send a request on your Rx blank, addressed to Department 150.)

Been sued for a king's ransom lately?

(Save this ad. You may need it tomorrow if you don't today.)

The St. Paul "Top Brass" Policy is for people like you who, by profession, are vulnerable to heavy liability judgments. Not every insurance company offers this kind of policy; few cover so broadly.

You can now increase your Professional (and personal) Liability coverage by as much as $5,000,000. And you get extra "major medical" coverage in most cases at no extra cost.

Now our brochure about this policy is printed on what appears to be solid mahogany. The thought of wasting one of these brochures makes our thrifty souls twitch. (The same thrift which has kept us so solvent these 114 years.) So only if you feel you really need our "Top Brass" brochure . . . write for one.

(*How efficient are you?* Unload your entire bundle of insurance detail on one pair of knowledgeable shoulders: a St. Paul agent or broker. Write or call.)

A. H. ROBINS COMPANY, RICHMOND, VIRGINIA 23220

Brief summary. Blurring of vision, dry mouth, difficult urination, and flushing or dryness of the skin may occur on higher dosage levels, rarely on usual dosage. Administer with caution to patients with incipient glaucoma or urinary bladder neck obstruction. Contraindicated in acute glaucoma, advanced renal or hepatic disease or a hypersensitivity to any of the ingredients.

A·H·ROBINS

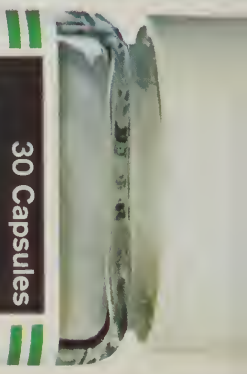
TWO WAYS TO GIVE YOUR PATIENTS A MONTH'S SUPPLY OF THERAPEUTIC VITAMIN C:

45 CABBAGES OR 30 ALLBEE WITH C

Your patient would have to eat 45 cabbages a month (1-1/2 a day) to get as much vitamin C as is contained in just one bottle of 30 Allbee with C capsules (taken one capsule daily). In addition, each capsule provides full therapeutic amounts of the B-complex vitamins. For example, as much niacin as 2 pounds of sirloin steak.

Write "30" for B and C deficiencies. This handy bottle of 30 Allbee with C capsules gives your patient a month's supply at a very reasonable cost. Also the economy size of 100. Available at pharmacies on your prescription or recommendation.

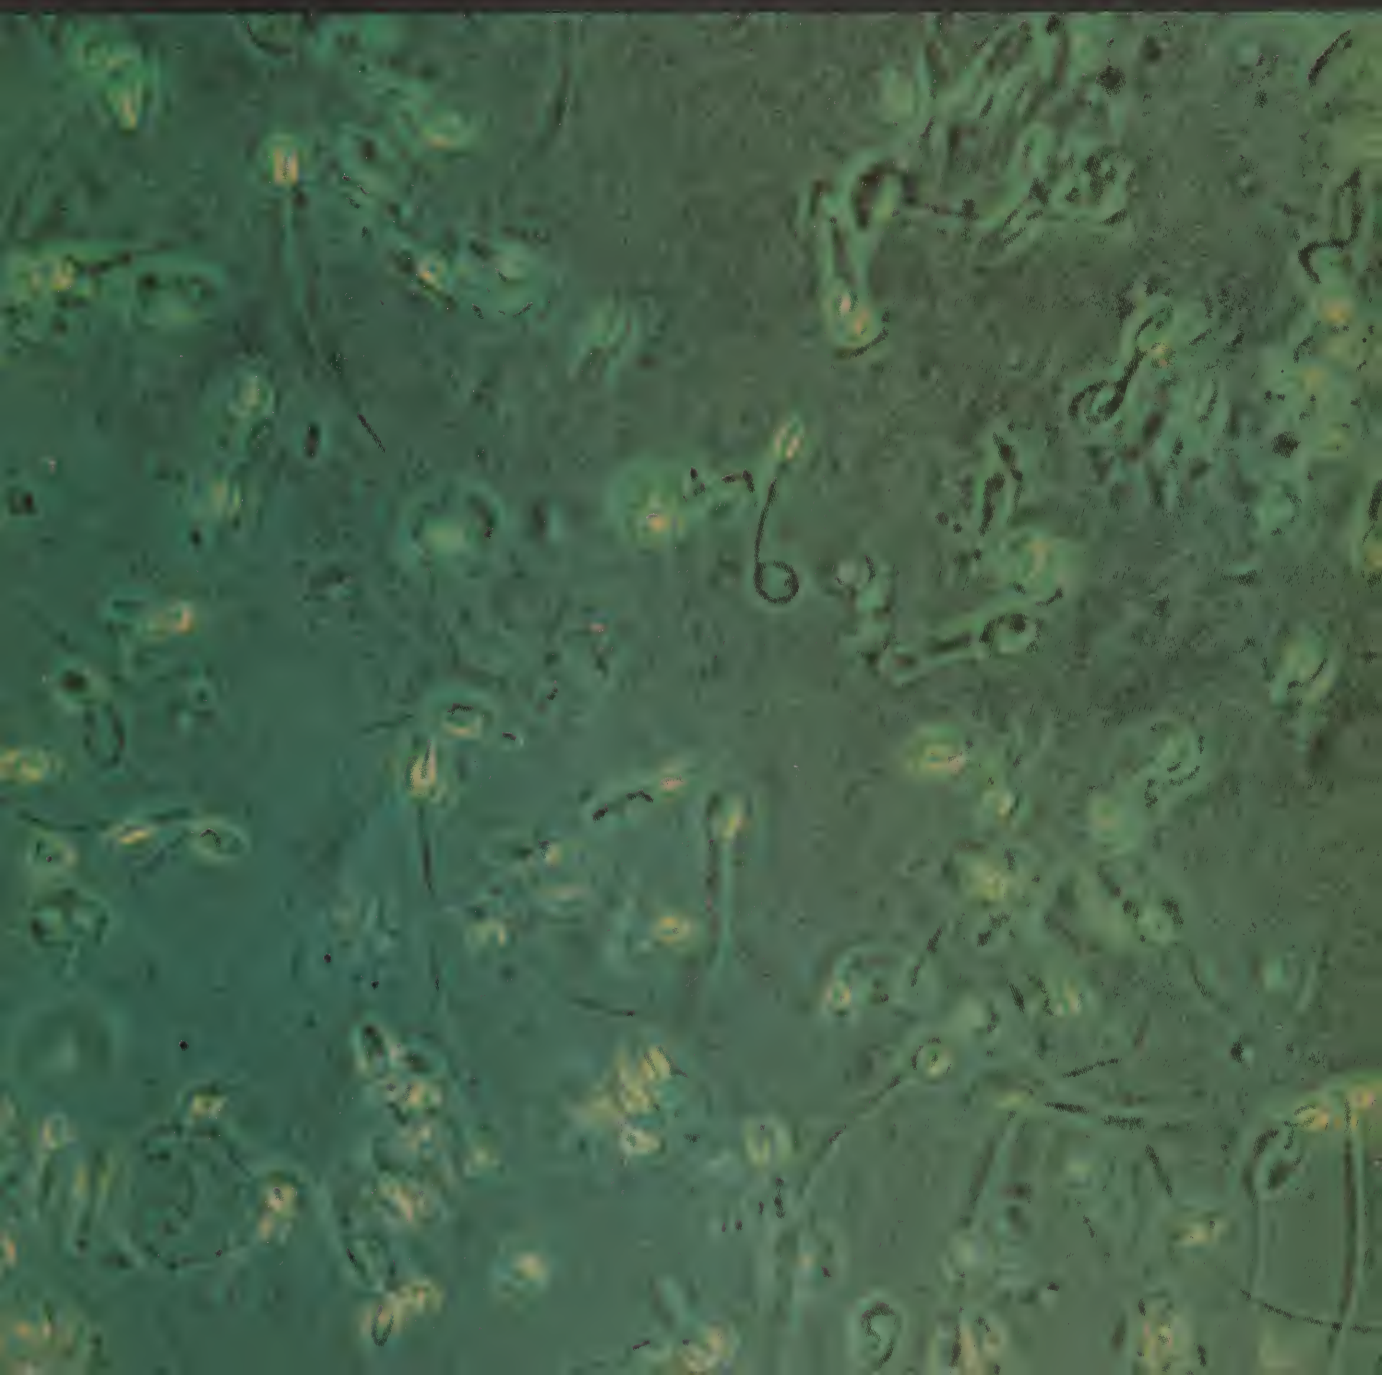
A. H. Robins Company, Richmond, Va. 23220.



A·H·ROBINS

30 Capsules
Allbee® with C

Each capsule Contains:



Thiamine mononitrate (Vit. B_1)	15 mg
Riboflavin (Vit. B_2)	10 mg
Pyridoxine hydrochloride (Vit. B_6)	5 mg
Niacinamide	50 mg
Calcium pantothenate	10 mg
Ascorbic acid (Vit. C)	300 mg

When the talk turns to oral contraceptives, it makes medical sense to remember low-dose Norinyl®-1.

(norethindrone 1mg. & mestranol 0.05mg.)

Turn page for contraindications, precautions and side effects.

Reduction of oral contraceptive dosage to the lowest effective levels is a well-accepted principle of conservative medical practice. In keeping with this view, Norinyl is now also available as Norinyl-1, containing exactly one half the previous dosage of norethindrone and mestranol. Clinical experience has established that effective fertility control can be achieved with the same degree of reliability and safety with new Norinyl-1 when taken as directed.

What about switching patients from higher dosage forms?

In transferring patients to low-dose Norinyl-1 from higher-dosage oral contraceptives, some breakthrough bleeding may occur in the early cycles. In the majority of cases the bleeding episode is mild and self-limited. The long-term advantages of the lower dosage form should be weighed against the inconvenience of possible breakthrough bleeding in the individual patient.

Contraindications: 1. Patients with thrombophlebitis or with a history of thrombophlebitis or pulmonary embolism. 2. Liver dysfunction or disease. 3. Patients with known or suspected carcinoma of the breast or genital organs. 4. Undiagnosed vaginal bleeding.

Warnings: 1. Discontinue medication pending examination if there is sudden partial or complete loss of vision or if there is a sudden onset of proptosis, diplopia or migraine. If examination reveals papilledema or retinal vascular lesions, medication should be withdrawn. 2. Since the safety of NORINYL-1 (norethindrone 1 mg. with mestranol 0.05 mg.) in pregnancy has not been demonstrated, it is recommended that for any patient who has missed two consecutive periods, pregnancy should be ruled out before continuing the contraceptive regimen. If the patient has not adhered to the prescribed schedule, the possibility of pregnancy should be considered at the time of the first missed period. 3. Detectable amounts of the active ingredients in oral contraceptives have been identified in the milk of mothers receiving these drugs. The significance of this dose to the infant has not been determined.

Precautions: 1. The pretreatment physical examination should include special reference to breast and pelvic organs, as well as a Papanicolaou smear. 2. Endocrine and possibly liver function tests may be affected by treatment with NORINYL-1. Therefore, if such tests are abnormal in a patient taking NORINYL-1 it is recommended that they be repeated after the drug has been withdrawn for two months. 3. Under the influence of estrogen-progestogen preparations, preexisting uterine fibromyomata may increase in size. 4. Because these agents may cause some degree of fluid retention, conditions that may be influenced by this factor, such as epilepsy, migraine, asthma, cardiac or renal dysfunction, require careful observation. 5. NORINYL-1 should be used with caution in patients with a history of cerebrovascular accident. 6. In relation to breakthrough bleeding, and as in all cases of irregular bleeding *per vaginam*, nonfunctional causes should be borne in mind. In cases of undiagnosed vaginal bleeding, adequate diagnostic measures are indicated. 7. Patients with a history of psychic depression should be carefully observed and the drug discontinued if the depression recurs to a serious degree. 8. Any possible influence of prolonged NORINYL-1 therapy on pituitary, ovarian, adrenal, hepatic or uterine function awaits further study. 9. A decrease in glucose tolerance has been observed in a small percentage of patients on oral contraceptives. The mechanism of this decrease is obscure. For this reason, diabetic patients should be carefully observed while receiving NORINYL-1 therapy. 10. Because of the occasional occurrence of thrombophlebitis and pulmonary embolism in patients taking oral contraceptives, the physician should be alert to the earliest manifestations of the disease. 11. Because of the effects of estrogens on epiphyseal closure, NORINYL-1 should be used judiciously in young patients in whom bone growth is not complete. 12. The age of the patient constitutes no absolute limiting factor, although treatment with NORINYL-1 may mask the onset of the climacteric. 13. The pathologist should be advised of NORINYL-1 therapy when relevant specimens are submitted.

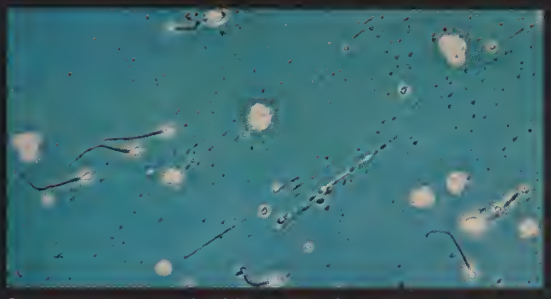
Side effects observed in patients receiving oral contraceptives: The following adverse reactions have been observed in patients receiving oral contraceptives: nausea, vomiting, gastrointestinal symptoms (such as abdominal cramps and bloating), breakthrough bleeding, spotting, change in menstrual flow, amenorrhea, edema, chloasma or melasma, breast changes (tenderness, enlargement and secretion), change in weight (increase or decrease), changes in cervical erosion and cervical secretions, suppression of lactation when given immediately postpartum, cholestatic jaundice, migraine, rash (allergic), rise in blood pressure in susceptible individuals, mental depression.

Although the following side effects have been reported in users of oral contraceptives, no cause and effect relationship has been established: anovulation post-treatment, premenstrual-like syndrome, changes in libido, changes in appetite, cystitis-like syndrome, headache, nervousness, dizziness, fatigue, backache, hirsutism, loss of scalp hair, erythema multiforme, erythema nodosum, hemorrhagic eruption, itching.

The following occurrences have been observed in users of oral contraceptives (a cause and effect relationship has been neither established nor disproved): thrombophlebitis, pulmonary embolism, neuro-ocular lesions.

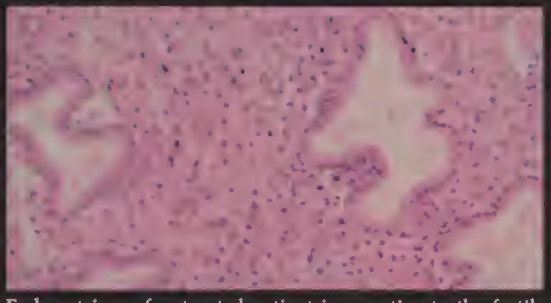
The following laboratory results may be altered by the use of oral contraceptives: increased sulfobromophthalein and other hepatic function tests, coagulation tests (increase in prothrombin, Factors VII, VIII, IX and X), thyroid function (increase in PBI and butanol extractable protein-bound iodine and decrease in T^3 values), metyrapone test, pregnanediol determination.

norethindrone — an original steroid from
SYNTEX
LABORATORIES INC., PALO ALTO, CALIF.



Here's why Norinyl-1 makes medical sense.

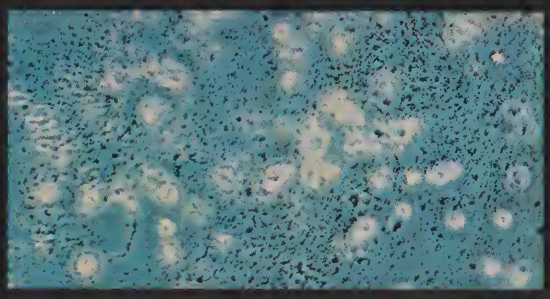
The effectiveness of Norinyl-1 as a low-dose oral contraceptive may be explained by its possible multiple action. In addition to its primary action of suppression of ovulation, Norinyl-1 may offer additional protective mechanisms... (1) creation of a cervical mucus that may be hostile to sperm penetration, and (2) development of an endometrium that may be out of phase with nidation. These effects are illustrated below.



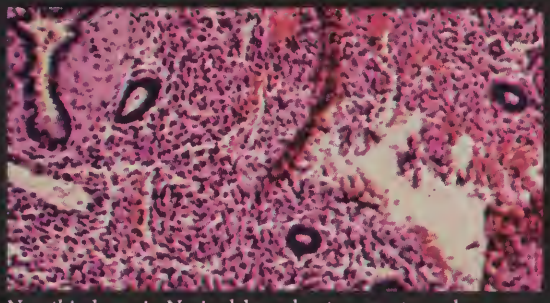
Untreated Patient

Cervical mucus at midcycle is usually thin and watery, with Spinnbarkeit (stretchability) of 15 to 20 cm.

Spermatozoa appear healthy, active, freemoving.



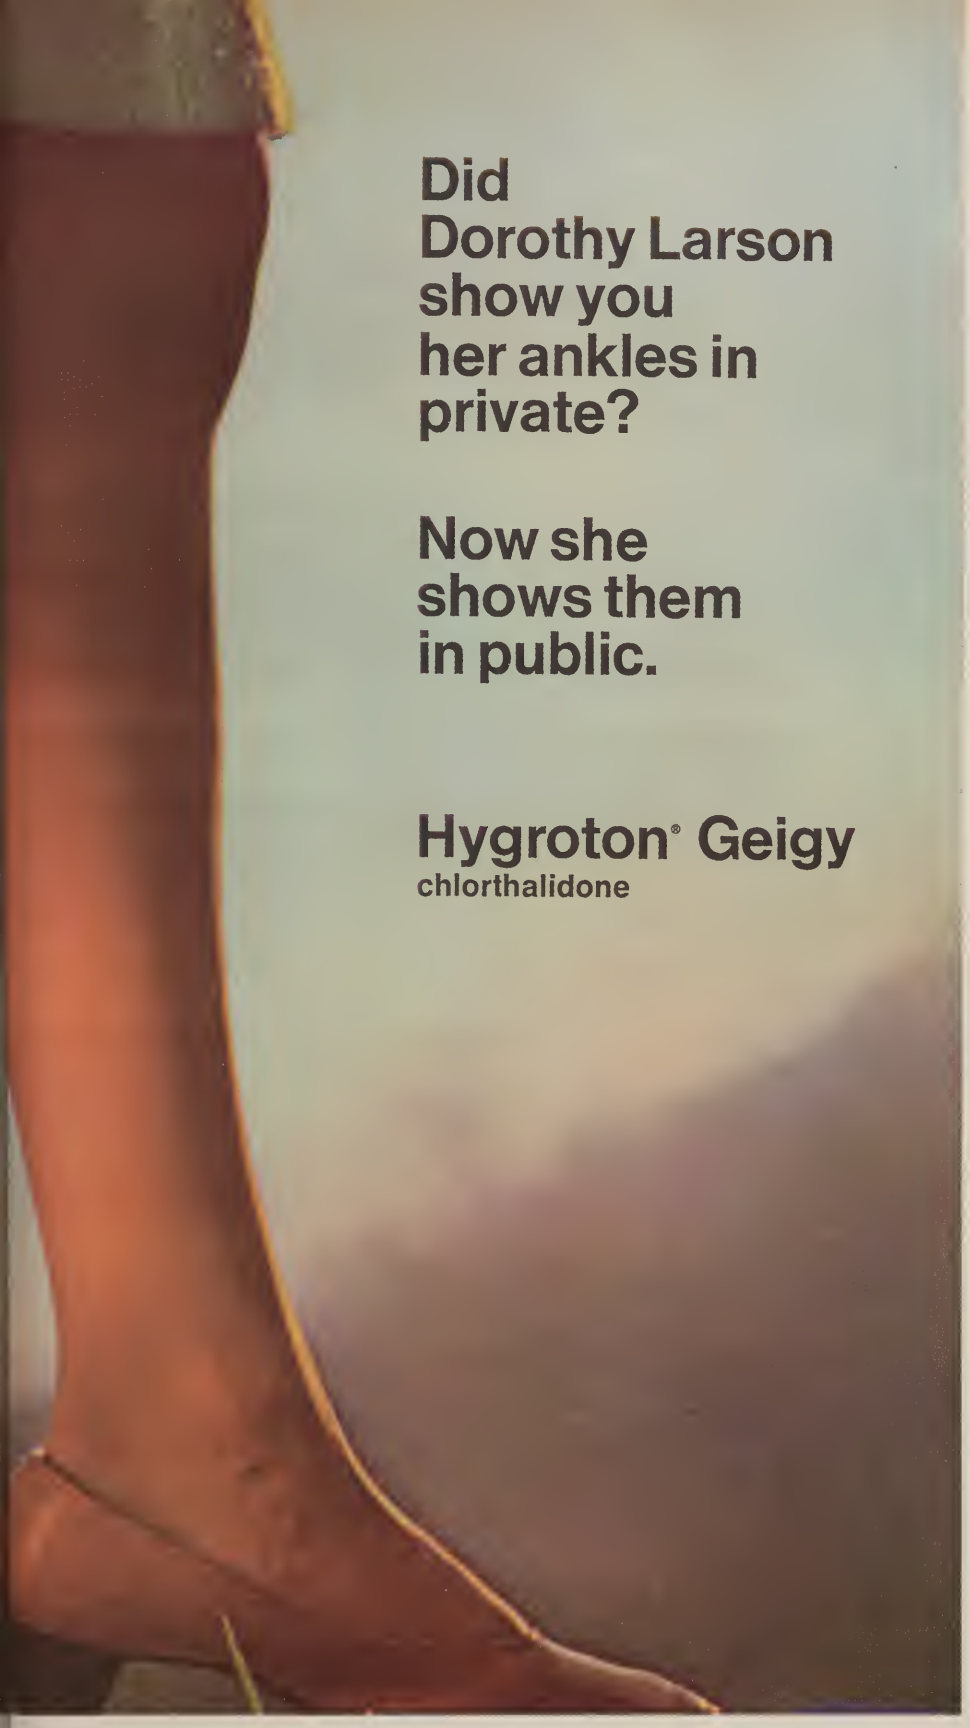
Endometrium of untreated patient is receptive to the fertilized ovum during secretory phase.



Norinyl-1 Patient

Cervical mucus at midcycle is scanty, viscous—with Spinnbarkeit of 1 cm. or less.

Immobile spermatozoa as they appear in cervical mucus taken from patient treated with Norinyl-1.



Norethindrone in Norinyl-1 accelerates secretory phase, suppresses glandular and vascular development.

Norinyl®-1
(norethindrone 1mg. & mestranol 0.05mg.) tablets

- new low dose of time-proved ingredients
- established norethindrone/mestranol ratio
- lower patient cost

Indications: Hypertension and many types of edema involving retention of salt and water.
Contraindications: Hypersensitivity and most cases of severe renal or hepatic disease.
Warning: With the administration of enteric-coated potassium supplements, which should be used only when adequate dietary supplementation is not practical, the possibility of small bowel lesions (obstruction, hemorrhage, and perforation) should be kept in mind. Surgery for these lesions has frequently been required and deaths have occurred. Discontinue enteric-coated potassium supplements immediately if abdominal pain, distention, nausea, vomiting, or gastrointestinal bleeding occur. Use with caution in pregnant patients, since the drug may cross the placental barrier and adverse reactions which may occur in the adult (thrombocytopenia, hyperbilirubinemia, altered carbohydrate metabolism, etc.) are potential problems in the newborn.
Precautions: Antihypertensive therapy with Hygroton should always be initiated cautiously in postsympathectomy patients and in patients receiving ganglionic blocking agents or other potent antihypertensive drugs, or curare. Reduce dosage of concomitant antihypertensive agents by at least one-half. Barbiturates, narcotics or alcohol may potentiate hypotension. Because of the possibility of progression of renal damage, periodic determination of the BUN is indicated. Discontinue if the BUN rises or liver dysfunction is aggravated. Hepatic coma may be precipitated. Electrolyte imbalance, sodium and/or potassium depletion may occur. If potassium depletion should occur during therapy, Hygroton should be discontinued and potassium supplements given, provided the

Did Dorothy Larson show you her ankles in private?

Ardsley, New York 10502

HY-5576R

Some U.R.I. patients are more miserable than others.

That's why we make Novahistine® tablets in two different formulations.

And let you control the dosage.

Each Novahistine LP tablet contains phenylephrine hydrochloride, 25 mg.; and chlorpheniramine maleate, 4 mg.
Each Novahistine Singlet tablet contains phenylephrine hydrochloride, 40 mg.; chlorpheniramine maleate, 8 mg.; and acetaminophen, 500 mg.

With Novahistine LP tablets and Novahistine Singlet™ tablets you have the range and flexibility of decongestant dosage that lets you prescribe for the needs of the individual patient.

Novahistine LP tablets are most useful for relief of nasal congestion in patients without pain or fever. Novahistine Singlet tablets, which provide analgesic-antipyretic effect, as well as decongestant action, are indicated for upper respiratory infections accompanied by pain, aches and fever.

Whether you prescribe Novahistine LP or Novahistine Singlet, a total daily dose of 3 or 4 tablets will usually provide effective, continuous relief.

Use cautiously in patients with severe hypertension, diabetes mellitus, hyperthyroidism or urinary retention. Caution ambulatory patients that drowsiness may result.

"Nothing else I've tried seems to work, so I decided to give you a crack at it."

PENINSULA GENERAL FINDS VISUAL CONTROL PANELS SIMPLEST WAY TO KEEP TRACK OF PERSONNEL AND PATIENTS

It's no secret that hospital personnel are difficult to keep track of.

There are so many categories of para-medical personnel, each with its own skills and areas of duty, that a simple, universal means of quickly determining who is filling work assignments has not come into general use.

Peninsula General Hospital, a 200, going on 265-bed hospital in Edgemere, Long Island, has found the answer to the problem in a visual control panel system that has removed the time consuming uncertainty and headaches of maintaining duty rosters, and patient care information.

The system's simplicity has caused an almost embarrassed reaction from staff members for "not having it long ago."

Until a few weeks ago, Director of Nurses Anita Nussdorf's job was not so simple. She has the weekly responsibility of assigning 247 of Peninsula's personnel to 12 nursing stations. Under the old system, she recorded assignments on large sheets of lined paper. During the week, they were referred to constantly with much head-scratching to keep track of and make changes in the various assignments.

Today, Mrs. Nussdorf has only to peek over her shoulder at a "Visual Control Panel" to learn at a glance every bit of information she needs know about the assignment.

Made by Acme Visible Records, Inc., the panel is of a type that has been sold to industrial and commercial organizations for years for quick visual monitoring of everything from perpetual inventories to the identification of trucks on the

Togetherness....

...can be rough when epidemics of nausea and vomiting strike a family. Emetrol offers prompt, safe relief. It is free from toxicity[1] or side effects[2,3] and will not mask symptoms of serious organic disorders.

Fort Washington, Pa.

Emetrol®
phosphorated carbohydrate solution
emesis control

road. Its fortuitous application of the panel to Mrs. Nussdorf's problem is a recent extension of its use.

A further extension of this principle at Peninsula General is the use of *satellite* control panels at each of the nursing stations to enable quick access to information about patient care.

Procedure for maintaining the panels is not difficult. Each Sunday, Mrs. Nussdorf posts names on the panel to sections representing various assignments for each day of the week. The names are held in place by plastic tabs or "signals," as they are called, in the panel's tubes. These signals are colored differently for each personnel category. Thus, registered nurses are pink, licensed practical nurses are green, aids red, orderlies blue, and so on. In addition, small green or red plastic signals are slipped on next to the names to indicate each employee's availability on given days. Red signals are used to indicate holidays, vacation and sick days.

"I have only to glance over my shoulder to see the personnel lineup at the hospital for the week," Mrs. Nussdorf said. "If shortages develop at any point, personnel to fill them can be found in seconds and reallocated by referring to the panel. When calls come in for any personnel, they can be referred immediately to the proper station."

At each nursing station, a similar panel maintained daily by the medication nurse, displays the nursing-care plan for the entire station. This panel offers such information as patient's name and room number, his physician's name, his scheduled medications, treatments, X-rays, diet, status (eg, ambulatory), and the nurse assigned to him.

Much appreciated by physicians is that each doctor's patients are assigned the same color plastic signals. The doctor can spot his patients quickly by referring to his personal color.

Changes in the Visual Control Panels can be made quickly at any time to reflect changes in personnel assignments, patient status or other new information. Their flexibility and fast presentation of important information at Peninsula General has brought nods of approval from everyone there from board members down.

"The panels have simplified our planning and scheduling so much," concludes Mrs. Nussdorf, "that we wouldn't be without them now."

Tuckahoe, N.Y.

THE JUNE CONVENTION—"KEEPING UP"

Demands placed upon the American health care system have made the health services industry the nation's fastest growing employment field, American Medical Association president Milford O. Rouse, MD, pointed out in a year-end report.

"Fifteen years ago it was the fifth largest employer, now it is third," said Dr. Rouse. "If present trends continue, it will become the nation's No. 1 employer by the early 1970s."

Few physicians need instruction in the facts concerning increasing demand. In addition to the growing claims upon him by patients, medical society, hospital, civic affairs, and family, the physician faces his responsibility to himself to "keep up" with medical developments.

The year-around task of "keeping up" is manifested by the stack of medical journals, which is regularly attacked but often seems to be self-regenerating.

Once a year, the physician has an opportunity to spend the better part of a week doing nothing but "keeping up" at world's largest medical meeting, the Annual Convention of the American Medical Association.

This year, the 117th Annual Convention of the AMA will be held June 16-20 in San Francisco. The Civic Auditorium, War Memorial, Opera House, and several nearby hotels will house the scientific program; the House of Delegates will meet in the Fairmont Hotel.

Approximately 600 scientific papers are to be presented, and more than 250 scientific exhibits will be on display as well as many industrial exhibits.

General Scientific Meetings Planned

Among special presentations planned are four General Scientific Meetings on automobile accidents, health care planning, management of

infectious diseases, and treatment of advance malignant disease.

—Automobile Accidents, with participation by Sections on Orthopedic Surgery, General Surgery, Pediatrics, Physical Medicine, and Preventive Medicine, as well as the AMA Committee on Medical Aspects of Automotive Safety.

—Health Care Planning, with participation by Sections on Preventive Medicine, Diseases of the Chest, General Practice, General Surgery, Internal Medicine, and Military Medicine.

—Management of Infectious Diseases, with participation by Sections on Experimental Medicine and Therapeutics, Allergy, Diseases of the Chest, General Surgery, Pediatrics, and Preventive Medicine.

—Treatment of Advanced Malignant Disease, with participation by Sections on General Surgery, Gastroenterology, General Practice, Internal Medicine, Nervous and Mental Diseases, Pathology and Physiology, Colon and Rectal Surgery (formerly Proctology), and Radiology.

Also, regular scientific programs will be presented by each of the 22 Scientific Sections, plus a program by the Section on Miscellaneous Topics. The latter program will include a full-day session on smoking and health sponsored by the AMA Committee on Research for Tobacco and Health, and a full-day session on neurological surgery in which the American Association of Neurological Surgeons will participate.

The entire scientific program will appear in the May 6 issue of the *Journal of the American Medical Association*.

International Science Fair Winners will Participate

The youngest exhibitors and official guests of the AMA at its Annual Convention will be two teenage high school scientists.

They will be chosen at the 19th International Science Fair in Detroit May 15-18 by members of the AMA Council on Scientific Assembly. Competing with over 400 other finalists from every state and several foreign nations, the two top AMA winners will be named for the excellence of their studies and exhibits in the basic medical sciences.

During the Convention, they will exhibit their displays in the Scientific Exhibit and will be introduced as honored guests of the AMA to the House of Delegates, the Woman's Auxiliary to

the AMA, and at the Scientific Awards Dinner.

The AMA has been participating in the International Science Fair for 13 years as part of its program to attract superior students to the study of the medical and health sciences.

Medical Motion Pictures/Color T.V.

Approximately 50 medical motion pictures will be shown as part of the scientific program at the convention.

Color television, presented live from a San Francisco-area medical facility, also will be featured.

The medical motion picture program will include the premiere of a new film on "Diagnosis of Heart Disease," made with the sponsorship of the American College of Cardiology. Narrator of the film is Tinsley Harrison, MD, Distinguished Professor of Medicine, University of Alabama, an internationally known authority on diagnosis of the causes of cardiac pain.

Other films to be included are "Radiographic Visualization of the Biliary System and Cholecystectomy and Choledochotomy," by Frank Glenn, MD; "Bullet Embolus of the Right Ventricle," by Arthur Beall; "Role of the Endometrium in Conception and Menstruation," by John Rock, MD; and, "Cold Light Endoscopy," by Norman P. Schenker of Munich, Germany, an award-winning film made in France, Germany and Austria.

Five Scientific Sections are to present programs on color television: Dermatology, case presentations; General Surgery, a surgical program including live telecast of an operation, moderated by J. Englebert Dunphy, Professor of Surgery, University of California; Laryngology, Otology and Rhinology, a program on sinus diseases; Obstetrics and Gynecology, the complete gynecologic examination; Orthopedic Surgery, spine problems in children.

Woman's Auxiliary Program

An afternoon of continuous health education films including films on sex education, drug abuse, physical fitness and nutrition will be a new feature at the 45th annual convention of the Woman's Auxiliary to the American Medical Association.

More than 2,000 physicians' wives are expected to attend the June 16-20 meeting at the St. Francis Hotel, in San Francisco. Auxiliary president, Mrs. Karl F. Ritter of Lima, Ohio, will preside.

On Sunday, June 16, the Auxiliary will hold a reception for their president, Mrs. Karl F. Ritter, and president-elect, Mrs. C. C. Long of Ozark, Ark.

The Monday luncheon will honor the leaders of women's volunteer organizations throughout the United States.

Milford O. Rouse, MD will be the guest speaker at the Tuesday luncheon honoring national Auxiliary past presidents and AMA Officers and Trustees and wives. At this time the Auxiliary will present its annual contribution to the American Medical Association Education and Research Foundation. (Last years' gift totaled $384,649.48.)

Following this luncheon, films will be shown for the remainder of the afternoon. This new feature will provide Auxiliary members with a catalog of available health education materials to be used in conjunction with existing Auxiliary programs.

The Auxiliary will also sponsor a program of daily activities for the pre-teens and teenagers of Auxiliary members. Local arrangements for the convention are under the direction of Mrs. Lloyd Gillin and Mrs. Don C. Musser, both of San Francisco.

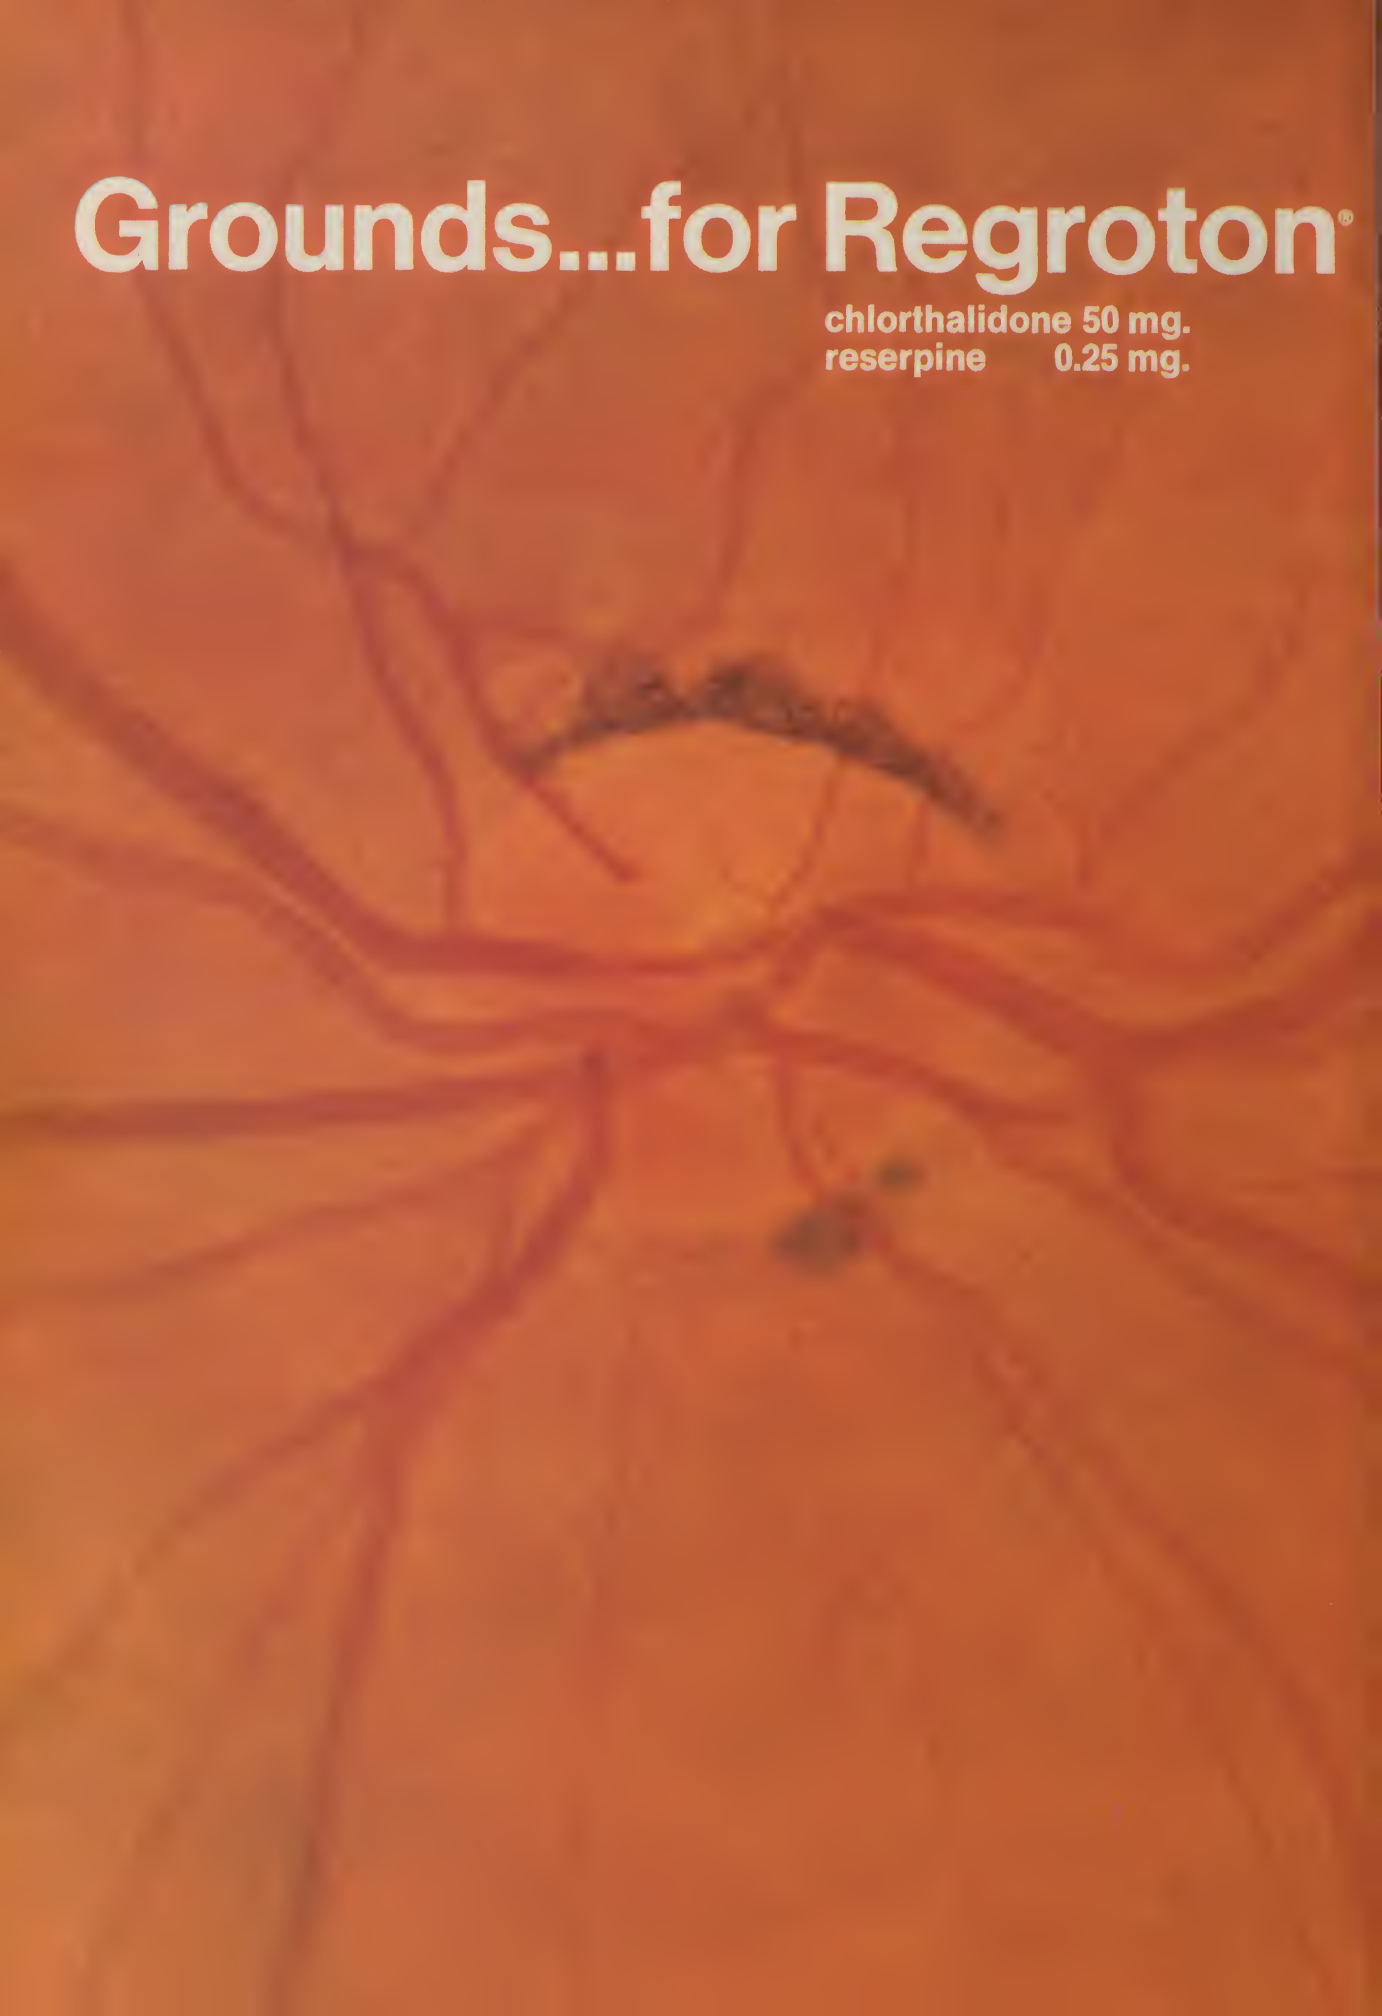
"All Otolaryngologists are Alike"

Just look at them and you can see how much they have in common. Besides, they all go through pretty much the same training, and pass the same kinds of tests, and measure up to the same sort of standards. Therefore, all otolaryngologists are alike. Right?

Wrong! But that's no more preposterous than what some people say about aspirin. Namely: since all aspirin is at least supposed to come up to certain required standards, then all aspirin tablets must be alike.

Bayer's standards are far more exacting. In fact, there are at least nine *specific differences* involving moisture content, purity, potency and speed of tablet disintegration, which make the manufacture of Bayer® Aspirin so different.

These Bayer standards result in significant product benefits, including gentleness to the stomach and product stability, that enable Bayer Aspirin tablets to *stay* strong and gentle until they are taken.



So next time you hear someone say that *all* aspirin tablets are alike, you can say, with confidence, that "it just isn't so."

You might also say that all otolaryngologists aren't alike, either.

Grounds...for Regroton®

chlorthalidone 50 mg.
reserpine 0.25 mg.

when you want to provide the combined benefits of two accepted agents in the treatment of mild to moderate hypertension. (Contraindications: history of mental depression, hypersensitivity, and most cases of severe renal or hepatic diseases.)

when you want to prescribe therapy that is generally well tolerated.

(However, adverse reactions may occur. For a complete listing, please refer to the full prescribing information which is summarized below.)

when your patient wants an easy-to-remember and reasonably priced regimen. (One tablet a day usually costs about a dime.)

Indications: Hypertension. **Contraindications:** History of mental depression, hypersensitivity, and most cases of severe renal or hepatic diseases. **Warning:** With the administration of enteric-coated potassium supplements, which should be used only when adequate dietary supplementation is not practical, the possibility of small-bowel lesions (obstruction, hemorrhage, and perforation) should be kept in mind. Surgery for these lesions has frequently been required and deaths have occurred. Discontinue coated potassium-containing formulations immediately if abdominal pain, distention, nausea, vomiting, or gastrointestinal bleeding occur. Discontinue 1 week before electroshock therapy, and if depression or peptic ulcer occurs. **Use in pregnancy:** Regroton should be used in pregnant patients or in women of childbearing potential only when, in the judgment of a physician, its use is deemed essential to the welfare of the patients; adverse reactions (thrombocytopenia, hyperbilirubinemia, altered carbohydrate metabolism, etc.) are potential problems in the newborn. **Precautions:** Antihypertensive therapy with Regroton should always be initiated cautiously in post-sympathectomy patients and in patients receiving ganglionic blocking agents, other potent antihypertensive drugs, or curare. Reduce dosage of concomitant antihypertensive agents by at least one-half. To avoid hypotension during surgery, discontinue Regroton therapy two weeks prior to elective surgical procedures. In emergency surgery, use, if needed, anticholinergic or adrenergic drugs or other supportive measures as indicated. Because of the possibility of progression of renal damage, periodic kidney function tests are indicated. Discontinue if the BUN rises or liver dysfunction is aggravated. Hepatic coma may be precipitated. Electrolyte imbalance, sodium and/or potassium depletion may occur. If potassium depletion should occur during therapy, Regroton should be discontinued and potassium supplements given, provided the patient does not have marked oliguria. Take particular care in cirrhosis or severe ischemic heart disease and in patients receiving corticosteroids, ACTH, or digitalis. Salt restriction is not recommended. Use cautiously in patients with ulcerative colitis or gallstones (biliary colic may be precipitated). Bronchial asthma may occur in susceptible patients. **Adverse Reactions:** The drug is generally well tolerated. The most frequent side effects are nausea, gastric irritation, vomiting, diarrhea, constipation, muscle cramps, headache, dizziness and acute gout. Other potential side effects include angina pectoris, anxiety, depression, bradycardia and ectopic cardiac rhythms (especially when used with digitalis), drowsiness, dull sensorium, hyperglycemia and glycosuria, hyperuricemia, lassitude, restlessness, transient myopia, impotence or dysuria, orthostatic hypotension which may be potentiated when chlorthalidone is combined with alcohol, barbiturates or narcotics, leukopenia, aplastic anemia, skin rashes, thrombocytopenia, agranulocytosis, nasal stuffiness, increased gastric secretions, nightmare, purpura, urticaria, ecchymosis, weakness, uveitis, optic atrophy and glaucoma, and pruritus. Eruptions and/or flushing of the skin, a reversible paralysis agitans-like syndrome, blurred vision, conjunctival injection, increased susceptibility to colds, dyspnea, weight gain, decreased libido, dryness of the mouth, deafness, anorexia, and pancreatitis when epigastric pain or unexplained G.I. symptoms develop after prolonged administration. Jaundice, xanthopsia, paresthesia, photosensitization and necrotizing angiitis are possible. **Average Dosage:** One tablet daily with breakfast. **Availability:** Pink, single-scored tablets in bottles of 100 and 1000. **For details, see complete Prescribing Information.** (B)46-600-B

Regroton® **Geigy**

This pain is getting on my nerves.

Patients in pain often experience concomitant anxiety and tension, which may add to the burden of pain.

For such patients, you may want to prescribe a preparation that offers more than simple analgesia.

A good choice is often EQUAGESIC® (meprobamate and ethoheptazine citrate with aspirin). It helps relieve pain. And anxiety. And skeletal muscle spasm as related to pain or anxiety and tension.

Equagesic® TABLETS

(meprobamate and ethoheptazine citrate with aspirin)

Wyeth®

Contraindications: History of sensitivity or severe intolerance to aspirin or meprobamate.

Warnings: USE IN PREGNANCY: Safety for use during pregnancy or lactation has not been established; therefore it should be used in pregnant patients or women of child-bearing age only when the physician judges its use essential to the patient's welfare.

Precautions: Keep out of reach of children. Not recommended for patients 12 years old or less. Carefully supervise dose and amounts prescribed, especially for patients prone to overdose themselves. Excessive prolonged use of meprobamate may result in dependence or habituation in susceptible persons—as alcoholics, ex-addicts, severe psychoneurotics. Withdraw gradually after prolonged high dosage to avoid possibly severe withdrawal reactions including epileptiform seizures. Warn patients of possible reduced alcohol tolerance. If drowsiness, ataxia or visual disturbances (impairment of accommodation and visual acuity) occur, reduce dose. If symptoms persist, caution patients against operating machinery or driving. After meprobamate overdose, prompt sleep, reduction of blood pressure, pulse and respiratory rates to basal levels, and hyperventilation are reported. Give cautiously to patients with suicidal tendencies. Treat attempted suicide (has resulted in coma, shock, vasomotor and respiratory collapse and anuria) with immediate gastric lavage and appropriate supportive therapy (CNS stimulants and pressor amines as indicated).

Side Effects: Ethoheptazine and aspirin may occasionally cause nausea, vomiting, epigastric distress, and rarely dizziness. Overdosage may result in CNS depression (drowsiness and lightheadedness) or CNS stimulation and salicylate intoxication (requires induced vomiting or gastric lavage, specific parenteral electrolyte therapy for ketoacidosis and dehydration, and observation for hypoprothrombinemic hemorrhage [usually requires whole blood transfusions]). Meprobamate may cause drowsiness, ataxia and rarely allergic or idiosyncratic reactions. These reactions, sometimes severe, can develop in patients receiving only 1 to 4 doses who have had no previous contact with meprobamate. Mild reactions are characterized by urticarial or erythematous maculopapular rash. Acute nonthrombocytopenic purpura with petechiae, ecchymoses, peripheral edema and fever have been reported. If allergic reaction occurs, meprobamate should be stopped and not reinstituted. Severe reactions, observed very rarely, include angioneurotic edema, bronchial spasms, fever, fainting spells, hypotensive crises (1 fatal case), anaphylaxis, stomatitis and proctitis (1 case) and hyperthermia. Treat symptomatically such as with epinephrine, antihistamine and possibly hydrocortisone. A few cases of leucopenia, usually transient, have been reported following continuous use. Rarely, cases of aplastic anemia (1 fatal case), thrombocytopenic purpura, agranulocytosis, and hemolytic anemia have been reported; almost always, in the presence of known toxic agents.

Composition: 150 mg. meprobamate, 75 mg. ethoheptazine citrate and 250 mg. aspirin per tablet.

Wyeth Laboratories Philadelphia, Pa.

Hairy sites where creams and ointments do not spread or penetrate readily.
Exposed areas where cosmetic considerations are important.

An invisible topical

for many dermatologic problems

Moist or intertriginous areas where drying action is desirable.

See last page for contraindications, precautions and side effects.

Structurally unique topical steroid in propylene glycol vehicle produces rapid response in many dermatoses.

Synalar Solution produces rapid antiinflammatory, antipruritic action through its unique topical corticosteroid, fluocinolone acetonide. The propylene glycol vehicle provides additional benefits for therapy at problem sites where it is difficult to achieve contact between the lesion and medication—or where creams or ointments may make the lesions worse. Synalar Solution has proved particularly valuable in the symptomatic treatment of seborrheic dermatitis of the scalp, nasolabial folds, eyebrows, ears, and in flexural folds such as the axillae, inframammary, umbilical and anocrural areas. It has also been reported to achieve excellent results in the adjunctive management of atopic dermatitis, contact dermatitis, neurodermatitis, nummular eczema, psoriasis, and sweat retention syndromes in these problem sites.

Penetrates the hairy sites.

In many areas of the body, hair gets in the way of treating the underlying dermatitis. The propylene glycol vehicle of Synalar Solution permits penetration and dispersion at sites where creams and ointments do not readily penetrate. May be applied without matting of hair.

Ideal for moist or intertriginous areas.

Propylene glycol is strongly hygroscopic and is especially useful where sweat retention is a problem. Its low surface tension permits easy spreadability in difficult-to-treat body areas. A number of studies have also shown that propylene glycol has inherent antimicrobial activity.

Cosmetically acceptable for exposed areas.

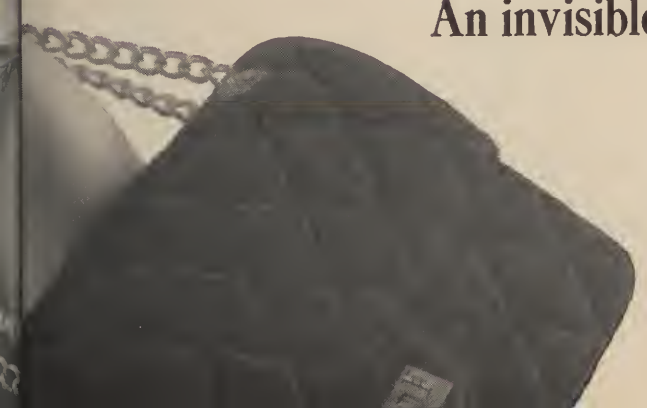
The propylene glycol vehicle of Synalar Solution possesses many useful cosmetic properties. Clear and greaseless, it is not sticky or messy, will not stain clothing or skin. In exposed areas of the body where cosmetic appeal is important, Synalar Solution shows nothing but results.

Economical—a little goes a long way.

Because of the properties of propylene glycol and the milligram potency of fluocinolone acetonide, a small quantity of Synalar Solution goes a long way. Also, the prescription price of a 20 cc. plastic squeeze bottle of Synalar Solution is surprisingly low. Thus, your patients obtain economy with the proved efficacy of a potent, truly advanced topical corticosteroid.

Contraindications: Tuberculous, fungal, and most viral lesions of the skin (including herpes simplex, vaccinia, and varicella). Not for ophthalmic use. Contraindicated in individuals with a history of hypersensitivity to any of the components.

Precautions: In some patients with dry lesions, the solution may increase dryness, scaling, or itching. Application to denuded or fissured areas, such as genital or perianal sites, may produce a burning or stinging sensation. If this persists and dermatitis does not improve, discontinue medication. Although propylene glycol has antiseptic activity, there should be careful initial evaluation and follow-up of infected sites. Incomplete response or exacerbation of lesions may be due to true infection, which requires susceptibility testing and appropriate therapy. On the other hand, saprophytic or low grade infections may clear spontaneously under the influence of Synalar Solution alone. Where severe local infection or systemic infection exists, the use of systemic antibiotics should be considered, based on susceptibility testing. While topical steroids have not been reported to have adverse effect on pregnancy, the safety of their use on pregnant females has not absolutely been established. Therefore, they should not be used extensively on pregnant patients, in large amounts, or for prolonged periods of time.



Side Effects: Side effects are not encountered ordinarily with topically applied corticosteroids. As with all drugs, however, a few patients may react unfavorably to Synalar under certain conditions.

Availability: Synalar (fluocinolone acetonide) Solution 0.01% in a propylene glycol vehicle with citric acid as preservative. 20 and 60 cc. plastic squeeze bottles. *Also available:* Synalar (fluocinolone acetonide) Cream 0.025% —5, 15 and 60 Gm. tubes and 425 Gm. jars. Cream 0.01%—15, 45 and 60 Gm. tubes and 120 Gm. jars. Ointment 0.025%—15 and 60 Gm. tubes. Neo-Synalar® (neomycin sulfate 0.5% [0.35% neomycin base], fluocinolone acetonide 0.025%) Cream—5, 15 and 60 Gm. tubes.

Radium Losses Prevented by Special Container

A special container to prevent radium losses during shipment has been developed at the Public Health Service's National Center for Radiological Health as a means of eliminating a cause of environmental contamination by radiation.

The development coincides with a recent rise in radium losses during shipment. The most recent incident occurred last June and involved the loss of 18 radium needles. Several of these remain unrecovered despite intensive searches by local, State, Federal, and private radiation specialists along the shipping route from San Diego, California to New York, New York.

"Radium needles and capsules, no more than a half inch long and an eighth of an inch thick, can be seriously harmful to health unless properly used by a physician or other qualified professional," said James G. Terrill, Jr., Director of the National Center for Radiological Health.

"A single needle may cause radiation burns if picked up by a person unaware of the hazard and carried for several hours," Mr. Terrill said. "Moreover, these sealed radium sources, when not properly packaged, can be broken. This, in turn, can spread radioactivity, with its threat of short-term or delayed health effects, over relatively large areas through the release of the encapsulated radium salts."

The shipping container is reusable. It has been designed specifically for medical radium capsules and needles in the commonly used sizes. It may be adapted readily, however, for radium-beryllium neutron sources and may be modified to provide a container for plaques and nasopharyngeal applicators. Development of the container primarily was the work of Frank B. Conlon, a Radiological Health Center engineer.

The container is, in effect, an interlocking of interior and exterior containers. These cannot be closed until one has been made fast to the other so that there can be no internal movement or accidental opening during shipment.

The interior container is in three sizes, each made to hold a maximum of either 50, 150, or 300 mg of radium. Each size is fabricated in two parts of threaded hexagon brass stock with bottom portions drilled to receive a limited number of radium capsules or needles of a given size. Bottoms and tops are tightened against a metal gasket to prevent leakage of radioactive gas which could occur with leaking radium needles or capsules.

The interior container is locked into the center of a cylindrical, lead-lined shield. This is accomplished by means of a plug-shaped closure in which the interior container is held fast by a spring-loaded device. The plug may be inserted and locked into the shield by a spring-loaded bayonet type lock, but only if the interior container has been properly positioned in the plug and is of a size suitable for a given shield.

The interlocked interior container and shield are secured in the center of the exterior container by engaging the shield in slotted channels built diagonally in the bottom and top of the container. The upper channels are so aligned that the exterior container may not be closed unless the shield closure is in a fully locked position. The exterior container, an 18-inch cube constructed of one-quarter inch plywood and metal corner mouldings, is sized to meet the dose rate requirements of transportation agencies with a minimum amount of lead shielding.

early relief from

DEPR

At the recommended Norpramin (desipramine hydrochloride) dosage level—initially 150 mg. per day—symptomatic improvement may often begin within two to five days. As depression subsides, daytime activity improves . . . mood fluctuations lessen . . . sleep is sounder. Fast onset of action and usually mild side effects are significant reasons for Norpramin's use in depression of any type . . . any degree of severity.

LAKESIDE

IN BRIEF:

INDICATIONS: In mental depression of any kind—neurotic or psychotic.

CONTRAINDICATIONS: Glaucoma, urethral or ureteral spasm, recent myocardial infarction, severe coronary heart disease, epilepsy. Should not be given within two weeks of treatment with a monoamine oxidase inhibitor.

RELATIVE CONTRAINDICATIONS: (1) Patients with a history of paroxysmal tachycardia. (2) Patients receiving concomitant therapy with thyroid, anticholinergics or sympathomimetics may experience potentiation of effects of these drugs. (3) Safety in pregnancy has not been established. (4) Perform liver function studies in patients suspect of having hepatic disease.

PRECAUTIONS: (1) Desipramine hydrochloride should not be substituted for hospitalization when risk of suicide or homicide is considered grave. Suicidal ingestion of large doses may be fatal. (2) If serious adverse effects occur, reduce dosage or alter treatment. (3) In patients with manic-depressive illness a hypomanic state may be induced. (4) Discontinue drug as soon as possible prior to elective surgery.

ADVERSE EFFECTS: The following side effects have been encountered: dry mouth, constipation, dizziness, palpitation, delayed urination, agitation and stimulation ("jumpiness," "nervousness," "anxiety," "insomnia"), bad taste, sensory illusion, tinnitus, sweating, drowsiness, headache, hypotension (orthostatic), flushing, nausea, cramps, weakness, blurred vision and mydriasis, rash, tremor, allergy (general), altered liver function, ataxia and extrapyramidal signs, agranulocytosis.

Additional side effects more recently reported include: seizures, eosinophilia, confusional states with hallucinations, purpura, photosensitivity, galactorrhea, gynecomastia, and impotence. Side effects which could occur (analogy to related drugs) include weight gain, heartburn, anorexia, and hand and arm paresthesias.

DOSAGE: Optimal results are obtained at a dosage of 50 mg. t.i.d. (150 mg./day).

SUPPLIED: NORPRAMIN (desipramine hydrochloride) tablets of 25 mg.; bottles of 50, 500 and 1,000; and tablets of 50 mg. in bottles of 30, 250, and 1,000.

Editorial

Maryland State Medical Journal
Vol. 17, No. 4
April, 1968

"Carthagina Delendenda Esse" (Cato the Elder)

Have we of the medical profession attained such a degree of corrosion that we are about to abdicate our rights and ways of practicing medicine as we see fit?

Are we about to permit outside organizations, motivated by self interest, to regiment us and those who will follow in our footsteps?

P. Bonnett, MD, past President of AHA, feels that the ultimate goal in medical care will not be attained until all physician's salaries are paid from a "Broad Based Pool under private or government auspices." This spells financial control of our profession, it means that we become employees of Hospital or Government, and as such we lose power of self determination.

What these organizations have achieved or proposed to achieve comes from a "Unity of Purpose" tantamount to a collusion between Hospital Administrators, Blue Cross, and allied organizations. Coercion is achieved through monolithic rules passed by these organizations, and if this fails, then financial strangulation will prevail through Blue Cross' power.

This *Unity of Purpose* is readily understood when one analyzes the composition of these various organizations. Membership in Blue Cross is overwhelmingly made of Hospital Administrators. The State Hospital Associations are composed entirely of Hospital Administrators. There is no better example in existence of conflict of interest than the one demonstrated by the overlapping interest of these various organizations. I call, and have called attention to this conflict of interest concept because Hospital Administrators, Blue Cross people and other organizations have been so very prone to invoke this concept as a pet device, as a spurious argument to prevent physicians from exercising their due rights. It is time for us of the medical profession to face facts, to realize that in Hospital Administrators, Blue Cross Administrators, State Hospital Administrators, we have organizations with the avowed *Unity of Purpose* to govern the practice of medicine. To this effect they will oppose us when their interest and ours conflict. To this effect they will seek government help to regulate us when there is conflict between their interest and ours.

Finally, it is with alarm that we should view the efforts of Hospital Administrators who attempt to extend the medical practices of Hospitals by employing physicians in fields other than radiology and pathology.

The remedy is clear and simple, we physicians must devote more time to the administration of Hospitals. We must seek and demand the appointment of medical men as Trustees of Hospitals. In this way we can participate in the deliberations of the Boards of Trustees and prevent decisions that would undermine the freedom of medical practice.

R. F. ARCHAMBAULT, MD

Originally published in JAMA, August 8, 1966. Reprinted with permission.

"Medicine was in the beginning and still is primarily personal in its activities; but with time and the growth of civilization, it has become more and more interwoven in the whole fabric of human society."—Ray Lyman Wilbur, '96 AM '97

Medicine in 1923 was like a giant awakening to discover that it existed as a great scientific and social force in society. For 150 years it had been trying to disentangle itself from magic, to establish itself on a sound scientific basis and to raise standards of medical education to those of the graduate level in the university. Great credit must go to the pioneers in scientific medicine of that period who were in large part responsible for bringing it to the point in 1923 where the public in this country and Europe was beginning to recognize medicine as a powerful force for good in our society.

THE MARCH OF MEDICINE 1923-1968

DWIGHT L. WILBUR, MD*

**Dr. Dwight L. Wilbur, '23, president-elect of the American Medical Association, is in a unique position from which to reflect upon scientific advancements and social changes which have affected the practice of medicine. Forty-five years ago his father, the late Ray Lyman Wilbur, '96, was elected to the same post. A prolific speaker and writer, the former Stanford President left a fine legacy of thoughts about the role of the doctor. His son has prepared this comparison of the practice of medicine in 1923 and 1968 specifically for our Stanford audience.*

An internist with a practice in San Francisco, the author received his medical degree at the University of Pennsylvania and spent several years at the Mayo Clinic before returning to the West Coast. He has served his profession and his alma mater in many capacities and for a number of years has been a clinical professor of medicine at Stanford.

The legacy of Stanford affiliation left by Ray Lyman Wilbur and his wife, the former Marguerite Blake, '98, is well entrenched in the Dwight Wilbur family. The AMA president-elect and his wife, Ruth Jordan Wilbur, '27, are the parents of Dwight L. Wilbur III, '51, MD '55, Jordan R. Wilbur, '53, MD '61, and Gregory F. Wilbur, '56, MBA '60. Dr. Jordan Wilbur, assistant professor of pediatrics at the Medical School, is a third-generation faculty member.

SOURCE: STANFORD ALUMNI ALMANAC
Vol. 6, No. 2—November 1967

1923

The great challenges facing medicine and the physician in 1923, when my father, Dr. Ray Lyman Wilbur, was inaugurated as president of the American Medical Association, were well expressed by him in his Presidential Address: To put medicine increasingly on the foundation of basic medical sciences, to use the experimental methods of science in medicine, to elevate the standards of medical education, to recognize the physician-patient relationship as a factor of pervasive importance in the practice of medicine, to appreciate the benefits of preventive medicine and public health measures and to properly understand the great social forces changing the relationship of medicine to society.

Looking back now, medicine in those days seemed fairly simple. Practice was carried on largely by the individual, a solo general practitioner—the beloved family doctor, so busy in the care of his patients that often he was unaware of the great changes taking place in medicine and in society about him. Skillful though he was in the

art of medicine, the science of medicine he practiced commonly was based on a very limited background of didactic teaching he had received in medical school. He was aware of specific causes of certain infections, such as tuberculosis, syphilis, pneumonia and typhoid fever. He knew how to diagnose them and to obtain proof in the laboratory that his patients had them. He could with X-rays and laboratory tests widely extend his diagnostic capabilities. He clearly understood the great public health measures in the prevention of disease. He encouraged vaccination against smallpox and often typhoid fever.

For the most part the drugs he used were for symptom relieving purposes. Derivates of opium, of digitalis, of salicilates like aspirin, of bromides and other simple sedatives were his main tools in the treatment of disease. The only real chemical cures of diseases he had were salvarsan—the famous 606—for syphilis, quinine for malaria, and arsenicals for amebiasis. Surgical treatment had advanced greatly in the preceding 20 years but it still carried a considerable mortality, was in large part limited to removal of diseased organs, and was often carried out by practitioners without expert training. It did not have the sound scientific basis of later days. In practice, diagnosis was good although limited, treatment was in large part symptomatic or surgical, and each was provided in a setting with as much of the art of medicine as the physician was capable of providing or willing to bestow.

Medical education in the early 1920s was undergoing changes that were deep and wide, largely owing to the efforts to implement the Flexner report of 1910, which laid the groundwork for the modern scientific university-based medical school. The evolution of the Stanford Medical School is a good case in point. Initiated as a proprietary medical school by Elias Samuel Cooper in 1853 and revived and greatly accelerated by his nephew, Levi Cooper Lane, it was in 1910 taken over as the medical department of Stanford University. This tie to the university greatly strengthened the medical school. It became increasingly scientifically based, acquired full-time professors of extraordinary ability, and began winning its way to a high place in medical education. Since the time of the transfer of the medical school to the University campus in 1959 it has become a great medical center and a university-based, research-oriented institution.

The great moves in medical education of that period were the increasing strength of basic medical sciences—physiology, biochemistry, bacteriology, and pathology. The development of the university hospital-medical school complex with its bedside teaching, geographic full-time professors in the clinical departments, and out-patient clinics, all were the factors that revolutionized medical education in this period. What was taking place was a change from preceptorship education to a form based on self-learning, on the experimental method, and on a closer relationship between the physician, the laboratory, and the patient.

Medical research was carried out by very limited numbers of medical school faculty members. It was usually patient-oriented, effected by a single investigator rather than by a team, and was financed chiefly by private funds and foundations, rarely by government. The money spent on it was a very small part of the medical school budget.

The financing of medical care in the early 1920s was largely up to the individual patient and his family. Government long since had limited its responsibilities at the state level to persons with serious mental disease, and at the county level to those without any means of support. Charity clinics and wards were common in medical schools and many other hospitals throughout the country.

The nurse in 1923, as now, was the principal professional associate of the physician. She was usually a graduate of a hospital school of nursing (a diploma school) or self-trained. She served 12 or at times 24-hour duty, seven days a week, and usually her care was given to one patient at a time. Laboratory technicians, physical therapists, and X-ray technicians generally had little, if any, formal training; they usually learned on the job and functioned primarily in hospitals or physicians' offices. Excepting dentists and pharmacists, the great array we now know as the allied health professions and services, was in those days unknown, or was unused, or existed only in research laboratories. The health team was yet to be developed.

Hospitals were primarily supported by universities, private foundations, charitable organizations, or the state or local governments. Not uncommonly patients went to hospitals for a rest or "rest cure," as well as for serious illnesses or operations. Costs of a stay in hospital were not high, and charity or educational funds were available to care for many who otherwise would have had to seek care in a county or city hospital. Much

of the great fear of hospitals as death houses—as a place to go to die—or for chronic or incurable disease still existed, but as medicine was becoming more scientifically based these fears and apprehensions were lessening.

The role of government in medicine in the early 1920s was clearly delineated. The federal government assumed complete responsibility for the medical and hospital care for military personnel and their dependents, for veterans with service-connected and many with non-service connected disabilities, for sailors in the Merchant Marine (in U. S. Marine Hospitals), and, in a few isolated instances, for other groups. State governments assumed responsibility for custodial and, such as it was, medical care of the insane, while local governments through city and county hospitals cared for local citizens who were financially unable to meet the costs of medical and hospital care.

State and local departments of public health were oriented to the prevention of contagious and infectious diseases. This meant responsibilities in sanitation, assuring a good water and milk supply, adequate disposal of sewage, control of flies and mosquitoes, and statistical analysis of the incidence of diseases (particularly those that were contagious). The general concern was for community health, with emphasis on the control of infections.

Private foundations, such as the Rockefeller Foundation, Commonwealth Foundation, and others, played a number of very important roles in medicine in the 1920s. Of greatest importance was the financial support of a number of medical schools which permitted them to go "full time," to strengthen faculties and research, to build new buildings and hospitals, and to establish themselves at the level of a graduate school in a university. The financial support permitting implementation of the Flexner report was probably the most potent factor in advancing medical education. Further stimulation of medical research in such institutions as the Rockefeller Institute for Medical Research and in medical schools, and the support of public health measures in this country and abroad designed to control malaria, yellow fever, and hookworm disease, were developments of far-reaching importance, for beyond the immediate advances in the public health in this country and abroad, they led to the establishment of schools of public health.

This, then was the picture of medicine in the early 1920s. It seems simple now. The great challenges were to expand the knowledge and application of medical science, to provide for better medical education, to stimulate and produce research, to awaken awareness of the great role of medicine in society, and to develop a means of financing the costs of medical and health care.

1968

Forty-five years seems a short time in human affairs. But in the years since 1923, the civilized world seems to have changed completely. Rapid transportation and communication, the splitting of the atom, the control of most infectious diseases, the lengthening of life, the understanding and practical application of better nutrition, and the increasing role of government in the life of the individual and of communities and nations have revolutionized the thinking of man as well as his life and environment. Developments in medicine have played as large a role in these changes as has any other factor. Indeed this role may have been the largest and the most important.

What has happened in medicine in this period? In medical practice the greatest change has been that it is increasingly based on medical science. More has been learned in medicine in this time than was learned throughout history up to 1923. With these developments in science there has been some lessening of the art of medicine—that voluntary association of two men, one giving and one seeking relief. With the explosion of knowledge came the great era of specialization, the rise of the medical center, and the development of group practice. The spreading knowledge of the benefits of modern medicine, stimulated greatly by the experiences of millions of men and women in World War II and by care in Veterans Administration hospitals, by higher standards of education, and by mass communications media, has played a very significant role in abating fear and anxiety and in increasing demand for the benefits of what medicine has to offer.

Medical education has become increasingly costly and complicated. And for the individual student it is taking much longer because of the requirements of specialty training and military service. Today the average young physician is in his early thirties before he is ready to practice.

No facet of medical education has been more significant than the emergence of graduate medical education—the residency, the fellowship, and the training to be a specialist. The demands on the

individual and on the school have changed to the degree that the period in medical school—the "under-graduate" part of it—has become only a segment of the total medical educational process. Together the burgeoning public demand for good medical care, and the longer and more exacting educational process, have led to the development of more and larger medical schools. Concomitantly there has been a great increase in the size of medical school faculties.

Medical Research

Of all the factors responsible for the great change in medicine none has been more important than the growth of medical research. Vast sums of money, largely from the federal government, have made research institutes of most medical schools, have attracted more and more students into the basic medical sciences, have enlarged and strengthened faculties, have significantly altered the educational process and the administration of medical schools, and have led to a great spill-over of knowledge into medical education and practice. But much more knowledge is needed. Search for the cause and cure of cancer, for the control of hypertension, and for the prevention of diseases of the heart and of the coronary and cerebral arteries are among the countless practical goals sought by those who engage in medical research. Practicing physicians patiently wait for the development of new antibiotics, of new chemical agents to prevent and cure disease; for hormones and enzymes to lead to a new understanding of and treatment of diabetes, gentic defects, and countless other common problems.

No field of medicine lies more dormant or less understood nor is of greater importance than that of the study of the human mind. The potentials of psychology and psychiatry are enormous and research in these areas should lead us into better understanding, control, prevention, and relief of mental and emotional disorders—unhappiness, frustration, depression, anxiety and all those disorders which so commonly affect the individual and society.

The Committee on the Cost of Medical Care, of which Dr. Ray Lyman Wilbur was the chairman, recognized in 1932 that the provision of adequate scientific medical service to all the people, rich and poor, at costs which could be reasonably met by them in their respective stations in life, was of vital concern to everyone. The rising costs of medical care led to the development of voluntary health insurance—Blue Shield, Blue Cross and the services of insurance companies now covering, in part at least, 165 million people in this country. The demand for services and the need for financial assistance naturally led to the interest of organized groups, such as labor, in the financing of health care as a fringe benefit.

These factors led also to government participation in this important field, which at the state level began with medical care for crippled children, for the blind, for the destitute, and for others. In 1965 the federal government passed highly important amendments to the Social Security Act which established the familiar Medicare and Medicaid programs assisting persons 65 years of age and older and others who are medically indigent to get help and medical care at government expense.

Health and medicine have become matters of interest to almost everyone. The wide reporting of increasing developments in medical science to a better educated and more sophisticated public has whetted this interest. The growth of voluntary health agencies has reflected selective interest in certain diseases (for example, tuberculosis, heart disease, cancer, leukemia and poliomyelitis) and in these areas dedicated laymen, physicians, and other professionals have had wide and productive cross-fertilization of interests and activities. Unions and other employer groups, employees and the public have become well informed in the field of health and health insurance. The public press and other communications media have figured importantly in bringing health matters to the attention of the public. Candid and complete descriptions of the diagnosis and treatment of dramatic illnesses, such as the heart attack of President Eisenhower and the operation on President Johnson, had a profound educational effect. Community efforts in poliomyelitis, vaccine drives, population control, "the pill," and abortion, have brought home to many persons and families, in a practical way, knowledge of medicine and what it has to offer.

In 1968 we speak of a health care "industry." With almost five million people engaged in it, it is now the third largest in the nation. The amount spent for its "product" in 1967 is estimated at 50 billion dollars. Manned in large part by non-physicians, the health care industry has within it some 75 to 100 different categories of workers, known by physicians as "allied health professions and services." These include dentists,

nurses, pharmacists, hospital administrators, laboratory technicians of many kinds, physical, occupational, and other therapists and aides, medical secretaries, medical record librarians, and the like. For many of these groups formal education at the high school, junior college, and four-year college level or beyond is necessary, and in eight of the categories the educational program is approved by the scientific organization of those involved as well as by the American Medical Association.

The interrelationship of these various groups with physicians and one another is accomplished through what has been called a "health team." With a physician as captain, the health team under his direction can carry out a wide variety of health care services, including some that are as complicated or highly technical as, say, open heart operations. In fact in other cases, as well as minor illness, the physician calls on these people to assist him and participate in the care of patients. The composition and function of the health team will vary greatly in the setting of the university medical center or the rural area; in the hospital, clinic, or home; in the diagnosis and treatment of those with acute or chronic diseases; or in the handling of the mentally ill or the hypochondriac.

One of the most striking changes in medicine in the past 45 years has been the growth of specialties—the internist, the surgeon, the ophthalmologist, the dermatologist, and such. With this change has come a decline in the number of general practitioners, now often called family physicians. Efforts to reverse this process, lamentable to many who revered and relied so heavily on the "family doctor," are under way but how successful they will be remains to be determined. The trend toward specialization has led to great strength of specialty organizations, such as the American College of Physicians, the American College of Surgeons, and the academies, colleges, and associations of other groups. Most importantly, these groups have led to higher standards of education and practice, to consideration of high quality of care, and, in association with the American Medical Association, to the development of specialty boards. Also new is the Joint Commission on Accreditation of Hospitals, which sets and measures standards of care in hospitals, extended care facilities, and the like. Furthermore, these associations have participated actively in and stimulated development of programs in continuing medical education to keep practicing physicians up to date. No other profession has done so much to raise the standards of the services rendered by its members.

The shrinking of the world by rapid mass transportation and easier and frequent communication—together with the great involvement of the United States in military activities, government aid, and the needs of developing countries—has made many American physicians very knowledgeable in the fields of international medicine and health. Efforts to eliminate malaria and other infectious diseases, and to strengthen schools for medical and health professional personnel, have been significant but are largely in their infancy. At the same time, the tide of physicians coming to the country to learn, to practice, and to participate in the blessings of our country, has amounted to 7,000 a year—almost as many as the 7,800 we graduate annually from our own medical schools.

While the primary scientific challenge to medicine is in the advance through research to new truths as rapidly as possible, the great practical challenge has been to bring the role of medicine into the social world of 1968. This is not easy, if for no reasons other than psychological ones—barriers that so commonly separate the man of science and of medicine from the common man. The forces of medicine have tended to remain isolated rather than to be mixed in an intimate way in modern social forces. The training of the physician in medical science, and his relative isolation from the work-a-day world during medical school and the long period in internship and residency training, have significantly influenced his thinking, turning it toward medicine and its problems far more than toward the society in which his patient and he were born and must live and die. One consequence is that often he has failed to recognize the social needs of his patients and particularly those of modern society. He has been deaf to the demands not of his patients but of people as a whole for the benefits which medical science has to offer.

Government Involvement

A few great leaders in medicine saw the signs ahead and recognized the great economic barriers to meeting the medical needs and demands of people; but the politician, the sociologist, and the labor leader long preceded the medical world in answering the demands of people for relief from the economic barriers of health care. Inability to gain access to the services of physicians because of lack of financial resources, inadequate availa-

bility because of maldistribution of physicians, or long delays in getting appointments often have led to great dissatisfaction with the medical profession and with modern medical care.

Medical care is now commonly looked upon as a basic right. So are food, housing, and clothing. But this does not mean that the government should pay for them if the individual or family is able to do so. Where is the logic in the assumption that it is the government's responsibility except for those who cannot afford it for themselves? The growth of voluntary health insurance since World War II has far exceeded that for any other insurance in history, indicating a great need and desire on the part of people to obtain the benefits of modern medicine without economic disaster. It has further led to greater freedom in going to see the physician, in getting into hospitals, in benefiting from elective and optional procedures. Further, it has led to the use of insurance principles on the part of government and payment by government for financial and health care for those for whom it assumes responsibility rather than the direct rendering of such services by the government.

Most research in medicine, in universities and medical schools, is supported by federal funds. The National Institutes of Health, through a variety of types of grants, has done an outstanding job in funding medical research in this country. It continues to do so, and by so doing has been the most significant factor in advancing medical science. But the blessings have not been unmixed because medical schools have become largely research institutions where academic advancement largely depends on research accomplishments and on papers published. Research and teaching have somehow become separated, isolated one from the other, in this process. With acclaim and financial support going in large measure to research the medical faculties devotion to education has atrophied. All too often faculty members are most beholden to the federal government than to the university and medical school. Only recently the pendulum appears to have turned, carrying teaching back toward its rightful position of great strength and respectability; but the full swing will take years.

In the meantime, medical schools have other services and problems piled upon them. Because of the shortage of physicians, there has been great demand for the development of new medical schools and for existing ones to expand to the limit. Five new medical schools opened in this country in the fall of 1967, bringing the total to 94, and another 10 schools are on the drawing boards. The cost of a new medical school is placed at between 50 and 100 million dollars, the operating budget will average 20 million dollars a year, and the cost to a new medical school for each student is in the neighborhood of a half million dollars. Obviously, only the federal government can meet such costs. The problem is to maintain a quality of education that will produce physicians well enough grounded in knowledge and rounded in insight to be able to meet the great challenges and changes in medicine and society that lie ahead.

Medical schools have been challenged even more to assume increasing responsibilities in graduate medical education (internship, residencies and fellowships), and in many institutions there are more in this group in training than in the medical school itself. In addition, medical schools have been increasingly important in the field of continuing medical education—to keep the 250,000 practicing physicians in this country up to date through refresher courses, postgraduate education, and the like. Medical schools must not only operate or supervise large university or affiliated hospitals, they have responsibility for large outpatient clinics and now have been called upon to participate actively in community medicine—to establish centers for health care research to bring medicine to the people. Such models as are now being established may well become those adopted by the medical profession and communities in the future.

Increasingly important in the years ahead will be the people in the allied health professions and services who will play a large part in assisting physicians in one way or another in the health care of the people. More manpower is needed in all categories of health care workers. The education of these people is increasingly becoming the responsibility of high schools, junior colleges, colleges, universities, and professional schools. The integration of them into effective, efficient health care systems is one of the real challenges ahead. So is the development of means by which those who begin at the lower levels of the team's organizational structure can move to their advantage vertically, tangentially, or horizontally after additional education.

The old time beloved physician of the past, while perhaps short on the science of medicine,

was often a master of the art of medicine in the care of the patient and his family. Among the great challenges to the modern physician, with the increasing complexities of medicine and the growth of medical science, is to maintain compassion for and an understanding of his patient—to whom he must bring in the most effective way the best that medicine has to offer. Lord Lytton, years ago, beautifully expressed the symbolism of the role of the physician in this relationship when he wrote:

"To the true physician, there is an inexpressible sanctity in the sick-chamber. At its threshold the more human passions quit their hold on his heart. Love there would be profanation. Even the grief permitted to others he must put aside. He must enter that room in a calm intelligence. He is disabled for his mission if he suffers aught to obscure the keen, quiet glance of his science. Age or youth, beauty or deformity, innocence or guilt merge their distinctions in one common attribute—human suffering appealing to human skill."

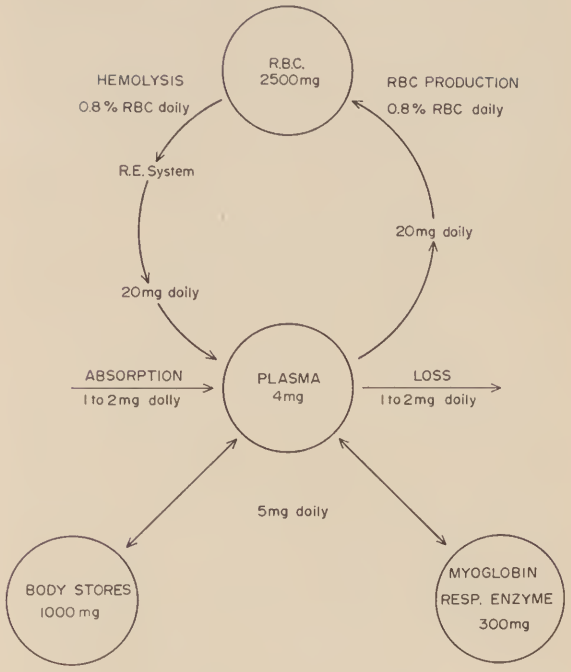
The challenges to medicine in society in America are great—stimulating, interesting, and unending. But because of the position of the United States in the world we also have great challenges in international medicine and health. Medicine and science know no international boundaries. The language they speak through the relief of suffering and misery, the control of pain, and the care of the sick and afflicted make the physician the prime ambassador of good will throughout the world. To bring to other nations, and particularly to developing nations, the great blessings and benefits of the art and science of medicine, is a very large and stimulating responsibility. Human hopes are universal and know no international barriers. Medicine and science constitute the best vehicle, the best catalyst to effect an answer to human hopes all over the world—the hopes for good health, for comfort, for freedom from disease, for liberty, and for peace.

FACTORS AFFECTING THE BODY IRON CONTENT:

THEIR RELATIONSHIP TO IRON DEFICIENCY AND IRON OVERLOADING

MARCEL E. CONRAD
LT COLONEL MC

Department of Hematology
Walter Reed Army Institute of Research



The total body iron in the adult male is about four grams.[1] This quantity of body iron is maintained at relatively constant levels throughout adult life to prevent the development of either iron deficiency or siderosis. This equilibrium is achieved by maintaining a delicate balance between iron absorption and excretion in which absorption plays the more active regulatory role.[2-4]

A fetus accumulates iron from maternal stores throughout pregnancy and has a total body iron content of approximately 250 mg at birth.[5, 6] The newborn infant is fed an iron deficient diet and absorbs little iron during the first few months of life.[7] Subsequently, sufficient dietary iron is absorbed to maintain a body iron concentration of 60 mg per kg and attain a four gram body iron content in adult life.[1] The growing child must absorb an average of 0.5 mg of iron daily in excess of body losses to fulfill these requirements.[8, 9] Contrariwise, the adult preserves a constant level of body iron by efficient conservation of this element, maintaining rigid control over absorption to balance losses. The adult male loses approximately one mg of iron daily, mostly in desquamated epithelium and secretions from the gut and skin.[10-13] During child-bearing years, the normal female loses an additional 30 mg of iron monthly (3 to 80 mg) from menstrual bleeding and about 600 mg with each pregnancy.[14-17] Each of these losses must be balanced by the absorption of an equivalent amount of iron or iron deficiency ensues. On the contrary, the absorption of excessive amounts of dietary iron without compensatory increases in excretion causes siderosis and tissue damage.

Most of the body-iron is present in circulating hemoglobin, a small fraction is incorporated in bone marrow hemoglobin, myoglobin and respiratory enzymes and the remainder is stored in tissues as ferritin or hemosiderin (Fig. 1).[18] Although the body absorbs only 1 to 2 mg of iron daily to maintain equilibrium, the internal requirement for iron is much greater. A red blood cell has a normal lifespan of 120 days so that 0.8% of circulating erythrocytes are destroyed and replaced each day. A human with a 5 liter blood volume has about 2.5 gm of iron incorporated into hemoglobin with a daily turnover of 20 mg of iron for hemoglobin degradation and production and an additional 5 mg of iron for other metabolic requirements.[19, 20] Most of this iron passes through the plasma for utilization. Disordered red blood cell metabolism produces internal derangement of body pools and causes changes in iron kinetics and metabolism. Hemolysis and polycythemia increase hemoglobin production and deplete tissue stores of iron until sufficient additional iron is absorbed to establish a new equilibrium.[20-22] Contrariwise, aplastic anemia and starvation decrease the production of hemoglobin and produce tissue siderosis.[23, 24] Chronic infection and inflammation decrease reutilization of iron from hemolyzed red blood cells; this relative unavailability of degraded heme iron for new hemoglobin production causes a hypoferremic microcytic anemia with iron replete stores.[25, 26]

Although certain disorders can cause marked derangements of iron kinetics within the body, the most important abnormalities of iron depletion and excess must effect either absorption or excretion or both. Thus, any examination of iron equilibrium must include careful scrutiny of the role of the intestinal mucosa. The simplest model of iron absorption must consider (1) the mucosal uptake of dietary iron and (2) the transfer of iron from intestinal cells into the body.[3, 4] It provides three anatomic locations for studying regulatory factors: (a) intraluminal (b) duodenal absorptive cells and (c) corporeal.

Figure 1: Iron Metabolism

Intraluminal Factors

Intraluminal factors affecting iron balance include those anatomic abnormalities, dietary constituents and intestinal secretions which enhance or decrease iron absorption. Adequate quantities of dietary iron must be exposed to the absorptive cells of the gut for a sufficient interval and in a physicochemical form that permits absorption of enough iron to fulfill body requirements. On the contrary, the availability of too much absorbable iron can cause siderosis.[27]

The iron content of the diet is probably the most important intraluminal factor affecting iron absorption. A relatively low incidence of iron deficiency is found in the United States where the adult diet contains 10 to 20 mg of iron. In contrast, the vegetarian diet of Asia contains 5 to 10 mg of iron and is often associated with iron deficiency. However, the problem is more complex; intestinal parasites, chronic infection and protein deficiency may cause or worsen iron deficiency, and a diminished intestinal absorptive surface is commonplace in Asiatic populations.[23, 25, 26, 28-33] Marked differences in the quantity of iron absorbed from various radio-labeled foods attest to the importance of the chemical composition of the diet.[32] Hemoglobin iron is absorbed more efficiently from food than inorganic iron,[34-37] ferrous iron is absorbed in greater quantities than ferric iron[38-39] and dietary constituents which solubilize iron may enhance absorption; whereas compounds that cause precipitation or molecular aggregation of iron decrease absorption.[37, 40-42] We will discuss these factors individually after brief consideration of the biochemistry of iron in aqueous solutions.

In aqueous solutions, metal ions are highly

solvated and are more or less strongly bound to each other through water bridges.[43,44] Increases in pH make more hydroxyl ions available to form metallic polymers or precipitated metallic hydroxides or both. When water molecules surrounding metallic ions are replaced by other molecules or ions, a metal complex or metal coordinating compound is formed. The characteristics of these complexed metallic compounds vary with the chemical structure of the chelator, the redox potential of the metal, the concentration of the substances in solution, the pH, temperature and duration of the solution. The steric location and the number of groups on chelators for combination with metallic ions determine many of the characteristics and physiologic properties of metallic complexes. Ethylenediaminetetraacetate (EDTA) is an ideal sequestering agent for metals with six coordinating bonds; it forms a stable water-soluble iron chelate which inactivates the metal ion and decreases absorption.[45,46] In contrast, the sugars or amino acids have fewer available ligands to bind metals and form less stable complexes that hold iron in solution, even at neutral and weakly alkaline pH. These ligands facilitate the absorption of iron at the alkaline pH of the duodenum by maintaining iron in solution and decreasing polymerization. Certain of these compounds may further enhance iron absorption by being absorbed in combination with the iron.

Metal precipitating agents such as soluble carbonates, oxalates and phosphates combine with metal ions to form insoluble salts which are poorly absorbed.[47] Certain of these anions do not form charged metal complexes but have lattice-building properties which bind anions and metal cations together into a large network. Thus, the combination of iron with the two negative oxygens of carbonate gives rise to a relatively unstable chelate which forms soluble and insoluble complexes of various molecular sizes. The relative amounts of metal ion and ligand often determine whether the product will be soluble or insoluble and in certain combinations the precipitate dissolves in excess precipitating agent.[43,44]

Intraluminal factors which may affect iron absorption are depicted in Figure 2. Many constituents of the diet affect the physicochemical form of dietary iron by either reduction-oxidation reactions or chelation or both. We believe that poor absorption of ferric iron can be attributed to its insolubility at the weakly alkaline pH of the duodenum. The term chelation is confusing because certain compounds that bind iron decrease absorption; whereas, other chelators enhance the absorption of iron from the gut. Food constituents such as the carbonates precipitate iron and form macromolecular aggregates which are poorly absorbed.[42] Conversely, certain amino acids and sugars depolymerize and solubilize iron to enhance absorption.[43,44,48-52] Whereas, some reducing compounds only convert ferric to ferrous iron, other reducing substances act as combinational chelators and reducers; ascorbic acid is a reducing chelator.[53,54] Any discussion of dietary constituents that chelate or reduce iron must consider other factors that influence their role in the gut. A partial listing is: (1) the concentration of the compound in the diet (2) the affinity of the compound for iron (3) the capability of the compound to bind ferric and ferrous iron and heme (4) the effectiveness of chelation at the physicochemical conditions encountered in the intestinal lumen and (5) perhaps the capability of the chelator to be absorbed into the intestinal mucosal cells in chemical combination with iron. Thus, ascorbic acid is a more effective chelator for inorganic iron than fructose or histidine because it binds iron in equimolar concentrations while the sugar and amino acids require approximately a hundredfold greater molar concentration to form a ligand.[48,54] Conversely, histidine binds heme to enhance absorption of heme-iron; whereas, ascorbic acid neither chelates heme-iron nor affects its absorption.[41] Similarly, compounds such as glycine which fail to bind iron at the duodenal pH do not affect absorption.[52]

Gastrointestinal enzymes which release the amino acids or sugars that complex iron from proteins or polysaccharides indirectly affect iron absorption by providing substrate for chelation. Whether intestinal enzymes directly affect iron

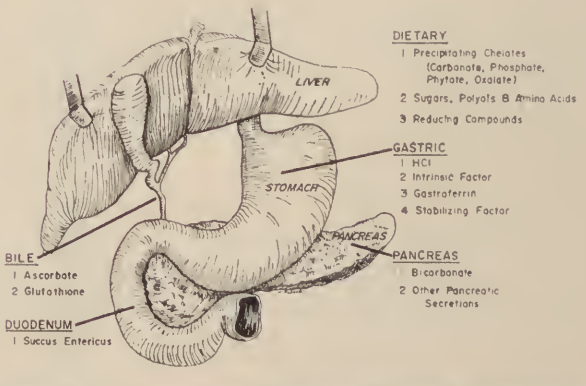


Figure 2: Intraluminal Factors Affecting Absorption

absorption by binding iron is unknown because they have not been individually studied.

Several substances have been identified in gastric juice which either solubilize iron or affect absorption or both. Gastric juice contains a "stabilizing factor" which solubilizes iron at the pH of the duodenum;[29] recent work suggests that this may be either B_{12} binding protein (intrinsic factor)[55] or endogenous ascorbic acid secreted into the stomach.[56] That intrinsic factor can chelate iron is not surprising because of the similarities between iron in the heme molecule and cobalt in vitamin B_{12}. Other investigators have reported a substance in gastric juice (gastroferrin) which binds iron and decreases iron absorption.[57, 58]

Lastly, we will discuss the role of hydrochloric acid, bile and pancreatic secretions in iron absorption. Many investigators have postulated that these secretions affected iron absorption.[59-62] This hypothesis was supported by the development of iron deficiency in gastrectomized humans[63-70] and animals with biliary fistulae[61] and the occurrence of hepatic siderosis in both patients and animals with pancreatic insufficiency.[71-81] However, variable results in iron absorption studies shed doubt upon the validity of earlier observations.[24, 82-85] Certain of these later investigations can be criticized because of the sole use of ferrous salts, the addition of insufficient acid to test doses of iron, or the utilization of test conditions which were not designed to detect decreased absorption of iron. Recent studies showed that gastrectomy and pernicious anemia were associated with decreased absorption of food iron, and that the ingestion of alcohol enhanced the absorption of ferric but not ferrous iron.[69, 86-90]

Dietary iron passes through the acid stomach into the alkaline duodenum for absorption. Gastric juice is sufficiently acid to release iron from foodstuffs and solubilize both ferric and ferrous iron.[43, 44, 89] This permits food iron to form ligands with endogenous and exogenous chelators which may either enhance or decrease iron absorption depending upon their chemical composition. The chemical reaction of ferric salts and chelators such as ascorbic acid, sugars and amino acids is unique in that it must be initiated at an acid pH to insure solubility of the iron at the slightly alkaline pH of the duodenum.[54]

$(FeCl_3 + \text{Ascorbic Acid}) + NaOH \rightarrow \text{Soluble Fe Chelate (pH 8)}$
$(FeCl_3 + NaOH) + \text{Ascorbic Acid} \rightarrow \text{Insoluble Fe Precipitate (pH 8)}$

In this reaction, iron displaces hydrogen ions from ascorbate to form complexes which solubilize iron over a wide range of pH and enhance absorption. In contrast, ferrous chloride combines with ascorbate at the pH of the duodenum making hydrochloric acid less important for enhancement of iron absorption from this compound. These data and the secretion of ascorbate in bile[91] provide an explanation for the development of iron deficiency in gastrectomized humans and the poor absorption of ferric but not ferrous iron in achlorhydric and gastrectomized subjects.

The exocrine pancreas has been shown to play a role in the absorption of iron.[71-81] In laboratory animals destruction of the acinar tissue results in increased iron absorption. Patients with pancreatic insufficiency secondary to chronic pancreatitis or cystic fibrosis have excessive iron absorption and hepatic siderosis. These changes seem related to the secretion of bicarbonate by the pancreas.[42] Bicarbonate causes precipitation of iron and the formation of macromolecular iron aggregates which are poorly absorbed. Further, animal studies show that the stimulation of pancreatic bicarbonate secretion by secretin decreases iron absorption. Although decreased pancreatic secretion of bicarbonate may explain the increased absorption of iron in chronic pancreatitis, cystic fibrosis and perhaps cirrhosis, it is unlikely that it is the sole defect in hemochromatosis since the addition of sodium bicarbonate to test doses of iron significantly affects iron absorption by normal animals but not in iron loaded or iron deficiency states.[42, 62, 71-81]

The capability of iron deficient animals to absorb increased amounts of iron from various iron preparations in the absence of hydrochloric acid or bile or in the presence of added quantities of sodium bicarbonate indicates that these intraluminal factors are less important regulators of iron absorption than the body's requirements for iron. The limited regulation of iron absorption by intraluminal factors provides an explanation for the slow development of iron deficiency in gastrectomized patients, the relatively mild state of iron deficiency observed in achlorhydric subjects and the limited iron overloading that occurs in most patients with pancreatic insufficiency. Gastrectomized patients may become more iron deficient than achlorhydric subjects with pernicious anemia because their anatomic defect decreases the quantity of iron exposed to mucosal cells in the first portion of the duodenum where iron is absorbed best. Perhaps the limited effect of intraluminal factors

upon iron absorption is related to an equilibrium established between small molecular weight iron complexes and macromolecules or precipitate. Iron-loaded subjects would remove little iron from the gut and maintain this equilibrium. Iron deficient subjects would absorb much of the available iron and establish a new equilibrium which provides more monomeric iron in an acceptable form for absorption. Thus, in normal, iron-replete subjects, the physicochemical form of intraluminal iron would have a greater effect upon the quantity of iron which is absorbed.

Mucosal Factors Affecting Absorption

The quantity of iron in the body is maintained primarily by controlled absorption from the duodenum and to a lesser extent by excretion.[2] To maintain balance, the duodenal mucosa must remain attuned to body requirements for iron. Sufficient iron must be absorbed to compensate for losses while available unneeded dietary iron is rejected. Hahn postulated that regulation was accomplished by a mucosal receptor which blocked the absorption of iron when it became satiated with iron.[92] The absorption of poisonous doses of iron indicates that this "mucosal block" can be overwhelmed[27, 93] but does not preclude the existence of a relative block which limits the absorption of excessive dietary iron.[4]

Many investigations of the absorption of iron have been undertaken in humans and animals. Pertinent data has been divided below into ten groups. The first seven describe findings in human studies. The last three are data from animal experimentation that have not been confirmed in man.

1. Generally, iron absorption can be related to the state of repletion of body iron stores. Enhanced absorption occurs with iron deficiency and decreased absorption with iron overloading.[24, 94-96]

2. Factors which stimulate erythropoiesis enhance iron absorption, whereas, diminished absorption occurs with decreased red blood cell production.[94, 96]

3. Although more iron is absorbed from larger doses of iron, the percentage of iron absorbed from larger test doses is increased.[92, 94]

4. Delayed appearance of a portion of oral test doses of iron in fecal collections of normal humans suggest that some of the iron is temporarily sequestered by the gut. This lag in intestinal transit is not observed in iron deficient subjects.[3]

5. Moderate quantities of ferritin are observed in the duodenal mucosal cells of normal subjects. Few particles of ferritin are found in the intestinal epithelium of iron deficient and hemochromatotic humans.[97, 98]

6. Intestinal responses to changes in the size of body stores or the rate of erythropoiesis are delayed. Increased absorption of iron does not occur until three to five days after bleeding.[92, 93, 99]

7. Body iron is lost in the feces in proportion to the state of iron repletion. Iron overloaded subjects can remain in negative iron balance in an attempt to reestablish a normal body iron content. This selective excretion is limited to a few milligrams daily unless bleeding occurs.[10, 100]

8. Iron from body pools can be concentrated in the small intestinal mucosa, where it may act to regulate the entry of dietary iron into the cell. Little dietary iron enters the mucosal cell of iron loaded animals and their duodenal mucosa is iron replete. Contrariwise, iron deficient animals concentrate little iron in their gut and absorb increased amounts of iron. Hypoxia and hemolysis increase iron requirements and cause depletion of intestinal iron with enhanced absorption.[3, 4, 10]

9. If intestinal iron acts to regulate the mucosal uptake of dietary iron, the chemical form of intestinal iron is more important than the total iron content. Starvation decreases the mucosal uptake of dietary iron without a concommitant change in the intestinal iron content. However, more dialysable iron (iron unbound to protein) is concentrated in the mucosa of starved animals than in normal rats.[24]

10. The transfer of iron from intestinal cells into the plasma can be decreased without changes in the mucosal iron content. Endotoxin decreases the absorption of dietary iron without affecting mucosal uptake from the lumen of the gut. Unlike other factors which affect iron absorption, endotoxin reduces absorption within hours after injection.[28]

These data suggest that duodenal absorptive cells act as an iron pool located between the intestinal lumen and the plasma (Fig. 3). The quantity of iron in these mucosal cells remains in equilibrium with labile body iron stores. If iron demands within the body are great, the intestinal

cells are depleted of iron. Contrariwise, if a surplus of body iron exists to meet iron requirements, more iron is incorporated into the mucosal cells. Since these cells are shed into the lumen of the gut at the end of a 2 to 3 day lifespan,[102] this can serve as an effective and selective excretory mechanism. Much circumstantial evidence has been accumulated to indicate that mucosal iron acts as a regulator of absorption.[3, 4, 103-106] Recent information suggests that some chemical forms of cellular iron inhibit mucosal uptake of dietary iron but cellular iron does not affect the transfer of iron from the absorptive cell into the body.[23, 28]

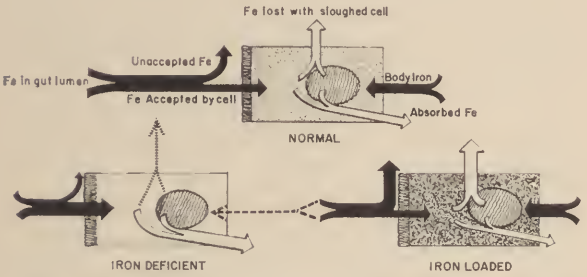

Figure 3: Iron Equilibrium in Intestinal Epithelium

A concept for control of iron absorption by the intestinal mucosa. It is predicated that iron absorption is regulated primarily through the columnar epithelium of the small intestine. In normal, iron-replete subjects the mucosal cells contain a variable amount of iron supplied from body stores. This deposit regulates — within limits — the quantity of iron which enters the cell from the intestinal lumen. Cellular iron may enter the body to meet current body requirements or remain within the epithelial cell to limit absorption and be lost when the cell is sloughed at the end of its lifespan. In iron deficient subjects little iron is retained by the cell because of increased body requirements. Therefore, absorption is enhanced and excretion is diminished. In iron-loaded subjects body iron is incorporated into the mucosal cells in increased quantities to limit absorption and enhance excretion.[3, 4]

Corporeal Factors Affecting Absorption

Two factors are usually cited as important stimuli to iron absorption. These are the rate of erythropoiesis and the tissue iron stores.[29, 30] Accelerated red blood cell production always seems related to enhanced iron absorption whether the cause be bleeding, hemolysis or hypoxia. Conversely, diminished erythropoiesis such as occurs with starvation, blood transfusion or return to sea level from high altitudes decreases the absorption of iron.[93, 96, 99] This makes it tempting to postulate that an erythrocyte stimulating factor acts as a messenger to the gut to increase iron absorption. However, enhanced iron absorption continues in iron deficient subjects long after the hemoglobin mass is restored to normal levels and persists until the body stores become normally replete with iron.[107, 108, 109] In addition, certain cirrhotics and patients with sideroblastic hypochromic anemia have increased iron absorption without accelerated erythropoiesis or depleted iron stores.[110-112] In these patients increased absorption seems related to increased iron turnover. Since accelerated hemoglobin production depletes iron stores, the level of labile iron in tissue stores may be a more basic regulatory factor. If we postulate tissue iron receptors, increased iron absorption would continue until these receptors were satiated and surplus iron would become available for both incorporation into intestinal cells to inhibit absorption and enhance excretion. Thus, idiopathic generalized massive iron overloading (hemochromatosis) would be either a disorder of these tissue receptors or an inability to utilize them properly.

Many investigators have searched for a blood factor which signals the gut to enhance or diminish iron absorption.[113] Careful studies indicate that the hemoglobin concentration and plasma levels of iron and transferrin do not perform these functions.[107, 108, 113, 114] Most factors which affect iron absorption do not exert an effect for several days.[92, 93, 105] That this lag is not caused by the 2 to 3 day lifespan of absorptive cells is suggested by the rapid diminution of iron absorption following an injection of endotoxin and the removal of a hypoxic stimulus.[28, 99] Thus, factors which have a delayed effect upon absorption such as erythropoietin,[115] or pituitary extracts[116] probably influence iron absorption by increasing body iron requirements and not by a direct effect upon the gut.

Several days after blood letting, humans have a transitory decrease in the serum iron concentration and have a sustained increase in the rate of plasma iron turnover. These changes occur simultaneous with the onset of enhanced iron absorption. The rapid iron turnover persists so long as iron absorption is abnormal, but the serum iron concentration returns to normal levels.[105] Animal studies show a similar relationship between increased absorption of iron and a rapid plasma clearance of radioiron in many physiologic situations.[99, 104, 105] However, the administration of endotoxin causes the reverse relationship[28]; decreased absorption of iron and a prolonged plasma iron turnover. Whether this indicates that plasma iron turnover has no etiologic relationship to absorption or that endotoxin causes changes in iron absorption by a different mechanism of action than other physiologic changes is unknown.

Absorption of Porphyrin Iron (Fig. 4)

Separate consideration must be given to the absorption of iron from porphyrins such as myoglobin and hemoglobin. Populations of countries where meat is an important constituent of the diet are usually iron replete, and it has been shown that iron is absorbed from oral doses of hemoglobin in a different manner than inorganic

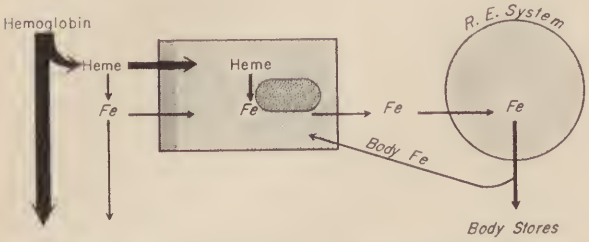

Figure 4: Absorption of Hemoglobin Iron

Schematic diagram of the absorption of hemoglobin-iron. In the duodenum hemoglobin is split by proteolytic enzymes with release of heme and small quantities of iron. Heme enters the intestinal cell as an intact metalloporphyrin. Iron is split from heme within the mucosal epithelial cell before it is transferred into the plasma. If a feedback control regulates the absorption of heme-iron, it must act either by limiting the release of iron from heme within the intestinal cell or by limiting the transfer of iron from the epithelial cell into the plasma or both.[37]

iron. Hemoglobin-iron is absorbed from food more efficiently than inorganic iron and the quantity absorbed is unaffected by the addition of ascorbic acid or iron-binding chelaters.[34-37, 41] Studies of labeled hemoglobin suggest that heme is split from globin by proteolytic enzymes within the duodenal lumen and the heme is absorbed into the intestinal mucosal cells as an intact metalloporphyrin.[37, 41] In humans, the iron is split from heme within the intestinal cell and transferred into the plasma in amounts that are regulated by the body's current requirements for iron.[36, 37] Unlike inorganic iron, heme is soluble in alkaline media and not in acid.[41] Thus, the duodenal pH is more advantageous for heme solutions than for iron salts. In solution, heme molecules have lattice building qualities and bind with each other to form macromolecular polymers that are poorly absorbed. Enzymatic breakdown of globin into amino acids in the duodenum enhances the absorption of heme because primary amines coordinate with the heme to maintain it as a small molecule in a monomeric state.[34, 45, 46] Similarly, the addition of amino acids or amides to the diet increases absorption by decreasing precipitation and polymerization of the metalloporphyrin within the intestinal lumen.

Iron Excretion

Previously, it was believed that the quantity of iron in the body was controlled by regulated absorption and that excretion played a passive role.[2] However, most cells contain iron somewhat in proportion to the quantity of iron in body stores. Thus the daily obligatory loss of cells from the skin and gut, and secretions such as bile, sweat and sebum provides a limited but selective loss of body iron.[4, 10-13, 100, 104] In addition, there is a normal daily fecal loss of about 0.7 ml of blood (0.4 mg of iron).[117] Excretion studies show that iron loaded animals lose more body iron than normal animals and iron deficient animals lose less. In humans, approximately one-third of body iron losses occur in the feces and two-thirds are lost from the skin.[11, 13] Usually, little iron is excreted in the urine (0.1 mg per day). However, sustained intravascular hemolysis can cause urinary iron losses that produce iron deficiency (10 mg per day).[118, 119] In normal iron replete humans losses are balanced by the absorption of dietary iron (1 to 2 mg daily). In transfusional siderosis daily excretion of iron exceeds absorption by about 4 mg in an attempt to reestablish the normal body iron content.[100] Comparison of acute and chronic studies of iron excretion shows that recently administered iron is lost in greater quantities than iron which has been incorporated into hemoglobin or body stores.[11, 13]

Iron Deficiency

Iron deficiency must be defined as a reduction of total body iron below normal levels. Arbitrarily, iron deficiency may be classified as mild, moderate and severe. Mild iron deficiency exists when the total body iron is reduced, but there is sufficient iron to provide a normal mass of hemoglobin. This may be detected by serum iron determinations or iron stains of biopsy specimens from the bone marrow or liver. Hemoglobin has a high priority for body iron and the iron stores will be depleted to maintain the hemoglobin concentrations.[107, 108, 120] The term iron deficiency anemia is properly used to describe moderate and severe iron deficiency because there is insufficient iron to make normal quantities of hemoglobin. It can be distinguished from other causes of anemia by demonstration of a decreased serum iron concentration; an elevated total iron binding capacity, and depleted iron stores in individuals with a microcytic hypochromic anemia.[121, 122] Unless there is an obvious cause of iron deficiency each of

these parameters should be tested to insure the establishment of a correct diagnosis. The physician's diagnostic responsibility does not end with the proper establishment of a diagnosis of iron deficiency—a cause for the decrement in body iron must be sought. Otherwise, therapeutic administration of iron may correct the anemia and delay detection of a bleeding cancer. Severe iron deficiency is manifested by a symptomatic anemia. Shortness of breath and a rapid pulse with mild exertion occur when the hemoglobin concentration is less than 7 g/100 ml. At these hemoglobin concentrations, the decreased oxygen carrying capacity of blood is complicated by hemoconcentration.[123] In addition, the circulating blood contains many minute and deformed red blood cells with a shortened lifespan which worsens the anemia.[31, 124]

Etiology of Iron Deficiency (Table I)

In countries where the diet is iron replete, iron deficiency must be considered "prima facie" evidence of bleeding until another cause is demonstrated. The physician who treats iron deficiency assumes responsibility to investigate patients for the underlying etiology lest he overlook a curable neoplasm. Blood loss is usually detected by the patient because of the intense pigmentation of hemoglobin unless it occurs as a result of (1) surgery or obstetric delivery, (2) excessive menses or (3) gastrointestinal bleeding. The surgeon frequently underestimates blood loss and women believe their menstrual loss is "normal" unless it is unlike previous periods. Intestinal hemorrhage can remain occult because hemoglobin is degraded by bacteria within the bowel and loses its characteristic appearance. Chemical analyses or radioisotopic techniques are usually necessary to show that blood is (or is not) in feces. Although the causes of gastrointestinal hemorrhage are extensively reviewed elsewhere, they deserve brief comment. Bleeding can be caused by intrinsic lesions of the bowel wall, intestinal parasites or a coagulation defect. Intestinal lesions may be benign or malignant. Endoscopic examinations and roentgenographic studies using contrast media are usually necessary to locate the lesion and establish a diagnosis. Surgical excision and pathologic examination may be required to ascertain whether the lesion is benign or malignant. Feces from every patient with iron deficiency should be examined for parasites. Hookworm infestation is prevalent and can cause severe anemia.[131] A single necator americanus bleeds man 0.1 ml daily, whereas, an ancylostoma duodenale causes twice this blood loss. Lastly, patients with thrombocytopenia lose small quantities of blood in their feces each day to become iron deficient if the disease persists for several months.

TABLE I

FACTORS RELATED TO IRON DEFICIENCY

1. Hemorrhage
   a. Benign and malignant lesions
   b. Trauma
   c. Intestinal parasites
   d. Coagulation defects
2. Malabsorptive Disorders
   a. Gastric
   b. Small intestinal
3. Dietary Factors
   a. Iron content of diet
   b. Composition of diet
   c. Protein deprivation
4. Inflammation and Infection
5. Increased Iron Requirement
   a. Growth
   b. Pregnancy

Patients with small intestinal malabsorptive disorders such as sprue have decreased absorption of iron.[125] It is postulated that this is caused by a loss of absorptive surface; the small intestine loses its characteristic villous appearance to become flattened and atrophic.[126,127] This may have added importance because the intestinal histology of normal Asians shows broadened and flattened villi which would decrease the surface area for absorption and may contribute to the incidence of iron deficiency in that geographic area.[33]

Gastrectomy and atrophic gastritis decrease iron absorption and can produce iron deficiency.[128] This seems to be caused by an inability to release ferric iron from food and permit this iron to chelate with endogenous and exogenous iron chelates which solubilize ferric iron so that it can be absorbed from the alkaline duodenum.[54]

In adult men and post menopausal women nutritional factors are rarely the sole cause of iron deficiency anemia. Iron losses are selectively limited and iron stores are sufficiently large to maintain enough body iron for prolonged periods of dietary deprivation. Contrariwise, the requirements of growing children and menstruating or pregnant females place them in a precarious state of iron balance so that a poor diet can rapidly lead to the production of iron deficiency anemia.[32] In children and young women the iron content and composition of the diet are important factors in the prevention of iron deficiency. A relatively low incidence of iron deficiency is found in the United

States where the adult diet contains meat and 10 to 15 mg of iron. In contrast, the vegetarian diet of Asia contains 5 to 8 mg of iron and is often associated with iron deficiency. In addition to the quantity of iron in the diet, the chemical form of the iron and various ingredients in the diet seem to play a role in the regulation of absorption.[29, 30, 32, 37, 41, 42] Consideration of these factors seems to provide the American diet with an additional advantage for maintaining iron balance.

Recent animal experimentation suggests that infection and protein depletion decreases the absorption of iron.[23, 28] In various studies of infections, acute processes cause decreased absorption, while equivocal changes are observed in chronic disease.[129-131] This may indicate that absorption is reduced until a new body equilibrium is established and then measurements of iron absorption become normal with a moderate reduction in the body iron content.[23] If similar changes occur in humans these factors would provide additional causes for iron deficiency in the underprivileged areas of the world.

Clinical Manifestations of Iron Deficiency

The symptoms of iron deficiency are nonspecific and often overlooked or attributed to psychogenic causes. The common complaints are fatigue, weakness, headache, dizziness, exertional dyspnea, palpitation, parasthesias, loss of libido and mild gastrointestinal symptoms.[132-135] They cannot be attributed solely to anemia because they occur in iron deficient subjects whose hemoglobin concentration is within the range of normal values. It is postulated that they are caused by a decrement of other essential iron containing compounds, such as the respiratory enzymes.[136-140] These enzymatic deficiencies may explain the changes occasionally observed in other organs such as the fingernails (koilonychia), tongue (papillary atrophy), esophagous (sideropenic dysphagia),[141] stomach (gastric atrophy),[142] skin (edematous depigmentation),[143] brain (pseudotumor with papilledema),[144] bones (roentgenographic changes, dwarfism)[145-146] and gonads (hypogonadism)[146] of certain iron deficient patients in various geographic areas. The spleen may become palpable in patients with simple iron deficiency anemia. In our experience, splenomegaly is only associated with moderately severe or prolonged iron deficiency unless it is a manifestation of another underlying disease.

A careful history for bleeding must be sought from every iron deficient patient. Blood loss from the hemorrhoids and menses is usually underestimated and the significance of tarry stools is not known by most patients. A geographical history can provide clues to dietary habits and parasitemia. The protein content of the diet is important and each patient should be specifically questioned to ascertain if they eat laundry starch or clay.[147-148] These latter dietary idiosyncrasies are often associated with severe iron deficiency.

Laboratory Tests of Iron Deficiency

Laboratory findings depend upon both the severity and duration of iron deficiency. The most useful techniques for establishing a diagnosis of iron deficiency are examination of red blood cells, measurement of the serum iron concentration and total iron binding capacity and estimation of the quantity of iron in bone marrow specimens. In moderate or severe chronic iron deficiency each of these tests is abnormal; erythrocytes are microcytic and hypochromic, serum iron levels are decreased, iron-binding protein values are elevated and bone marrow specimens contain no stainable iron. However, abnormalities in each test depend upon the (1) severity, (2) rate of induction and (3) duration of iron deficiency because (a) tissue stores are depleted to maintain the hemoglobin concentration (b) circulating red blood cells have a normal lifespan of 120 days and (c) certain body iron stores are mobilized slowly. This is exemplified by observations in humans who were made iron deficient by blood letting (Fig. 5 and 6).[108] Thus, in mild chronic iron deficiency the tissue stores are reduced or depleted at a time when the red cell morphology and plasma iron and transferrin measurements are normal. Contrariwise, immediately following acute blood loss, plasma iron determinations are a more sensitive indicator of iron deficiency than either the red cell morphology or iron stains of bone marrow specimens. Red blood cell indices are less reliable than examination of erythrocyte morphology because they are a mean value which fail to detect a double population of red blood cells. In the experiment illustrated by Fig. 5 and 6 the cellular indices remained within the range of normal values for 60 to 80 days after phlebotomy but stained smears of the peripheral blood showed a dimorphic population of red cells; older normal circulating cells produced before the induction of iron deficiency and younger microcytic hypochromic erythrocytes that reflected an iron deficient state.

Each of these laboratory tests is subject to experimental error. In addition to technical competence, accurate measurements of the serum iron and total iron binding capacity are dependent upon the preparation of iron-free reagents and glassware. The red blood cell indices are calculated from measurements of the hematocrit, hemoglobin concentration and red blood cell count. Inadequate mixing of blood before withdrawal of an aliquot for measurement is a common source of error for each of these tests. Poorly calibrated pipettes can cause significant errors in both the hemoglobin concentration and red blood cell count. Failure to enumerate less than 2000 erythrocytes in counting chambers produces errors greater than 5%. If bone marrow aspirates are used, careful preparatory techniques are needed to avoid excessive dilution of the smear with peripheral blood. If bone marrow biopsy specimens are prepared, the initial fixation should be performed at a neutral pH or iron is leached from the specimen. Even examinations of the red blood cells in a stained smear of peripheral blood are subject to marked variability of interpretation by different individuals.[120-122] Thus, a combination of these laboratory methods should be used to evaluate any suspected case of iron deficiency.

Ferrokinetic studies permit measurements of iron absorption and excretion, the rate of clearance of transferrin bound iron from the plasma and calculation of the body iron turnover and quantification of the percentage of an intravenous dose of transferrin-iron or hemoglobin-iron that is reutilized for synthesis of circulating hemo-

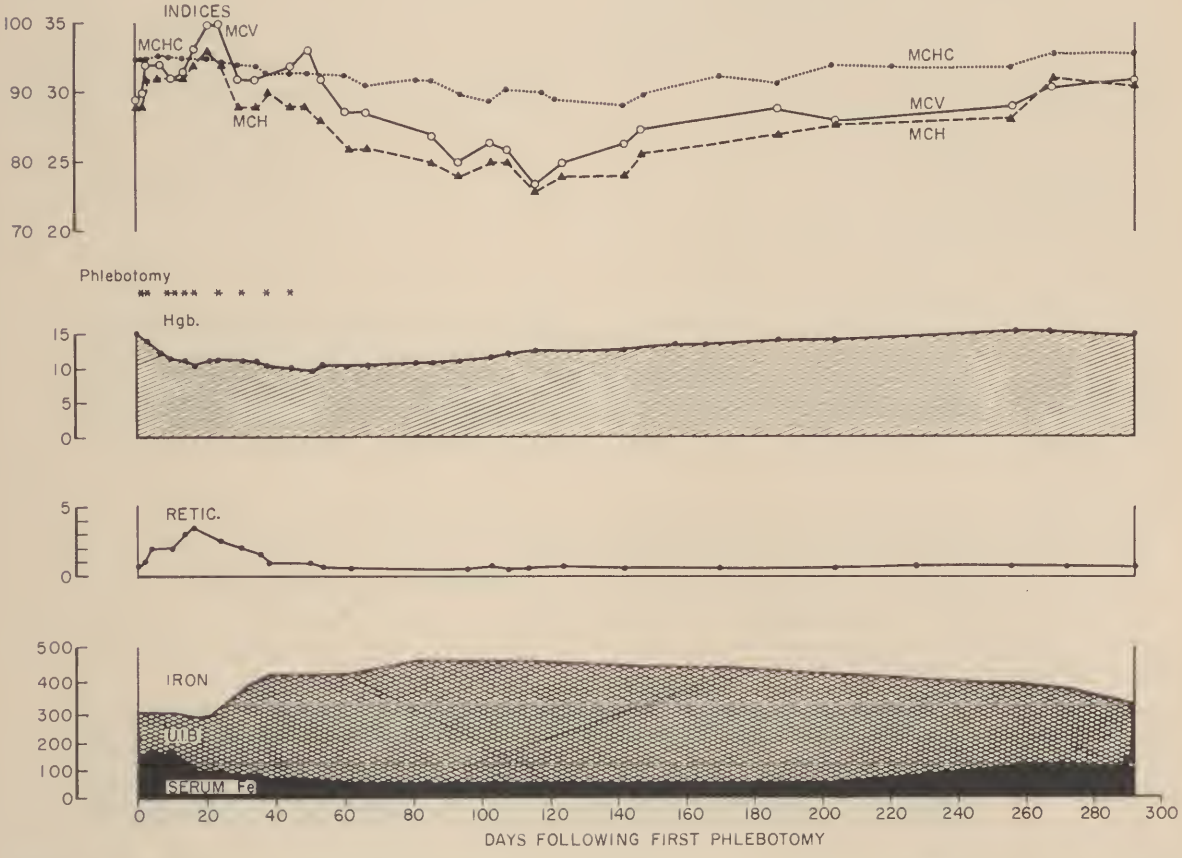

Figure 5: The effect of blood letting upon various laboratory tests for iron deficiency is illustrated above. Each asterisk represents a phlebotomy of 500 ml of blood (0.2 grams of iron). The hemoglobin concentration decreases in response to bleeding. Reticulocytosis occurs because of increased production of red blood cells but cannot be sustained after body stores are depleted of iron. The decreased serum iron concentration is the earliest evidence of iron depletion and is followed by a pronounced increase in the total iron binding capacity. These changes persisted until the hemoglobin concentration returned to normal prephlebotomy values. Examination of the cellular erythrocytic indices shows an increase in the mean corpuscular volume (MCV) 10 to 20 days after the initiation of phlebotomy, coinciding with the reticulocyte response. Then the cells gradually decreased in size but did not reach values below the normal range until 80 days after the bleeding was initiated. At 280 days blood values had returned to prephlebotomy levels. However, the bone marrow was depleted of stainable iron and iron absorption remained markedly increased.[29]

globin.[29, 30] Although much information has been learned from radioisotopic studies of iron metabolism, these tests are not practical methods for establishing the diagnosis of iron deficiency by the general medical practitioner. Each of these studies are time consuming and require special laboratory facilities and equipment.

Finally, the diagnosis of iron deficiency can be evaluated by a response to the administration of iron. Following the initiation of iron therapy, ing repeated doses of parenteral iron preparations,[150-153] (3) responsiveness to parenteral iron but not oral iron therapy can be used to diagnose malabsorption and (4) oral iron is less expensive than parenteral preparations. If a patient fails to respond to iron therapy or responds poorly, data supporting the diagnosis of iron deficiency must be carefully reevaluated. In geographic areas with poor nutrition combinational deficiencies of iron, folic acid and vitamin B_{12} are fre-

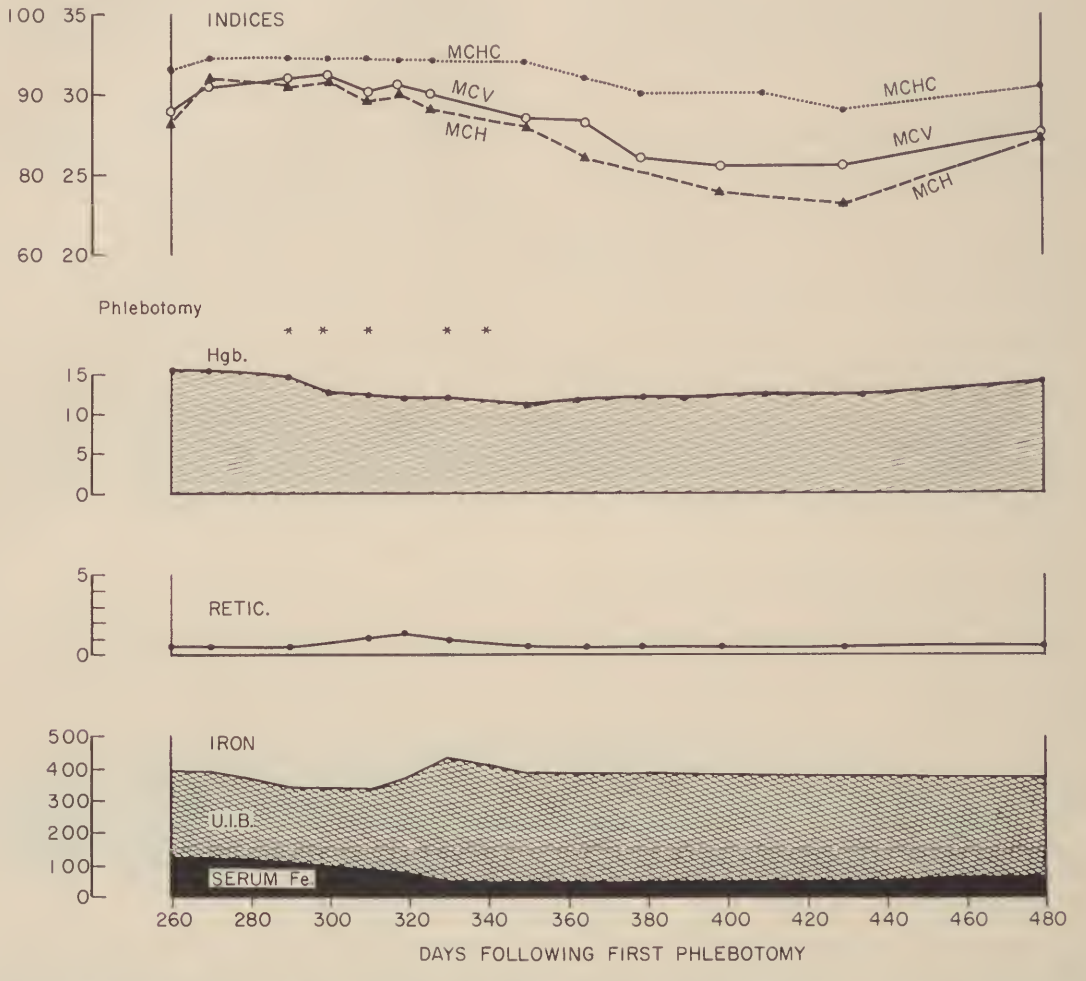

Figure 6: The subject of Figure 5 was bled an additional 2.5 liters of blood after recovery from abnormalities in the peripheral blood suggestive of iron deficiency. The lack of available iron in tissue stores prohibited the development of reticulocytosis in response to bleeding. Studies of the period required for repletion of the hemoglobin mass of this subject indicated he absorbed about 6 mg of iron from an American diet (15 mg of iron) daily.[29]

patients with iron deficiency anemia will develop reticulocytosis within 5 to 14 days. Subsequently, a rise in the blood hemoglobin concentration can be detected. A trial of oral iron should be utilized before resorting to parenteral iron preparations because (1) the rate of response is similar,[149] (2) serious reactions occasionally occur frequent.[154] These patients respond partially to treatment with one therapeutic agent and the hemoglobin concentration reaches a level below normal values. If iron is the initial therapy, the anemia becomes more macrocytic, whereas if folates or B_{12} are used microcytosis and hypochromia become marked. In parts of the world where nutri-

tion is adequate other causes for a retractory microcytic hypochromic anemia are more frequently encountered (Table II).

Generally, the iron-overloaded hypochromic anemias can be distinguished from iron deficiency by the elevated serum iron concentration and increased iron in tissue stores. Chronic infection, inflammatory diseases and neoplasia may cause a microcytic hypochromic anemia and hypoferremia because of an impaired capability to reutilize hemoglobin iron for the synthesis of hemoglobin.[25, 155] However, tissue stores usually contain stainable iron and the total iron binding capacity is decreased rather than elevated. Patients with pulmonary siderosis show evidence of iron deficiency because the lungs sequester excessive quantities of iron at the expense of the remainder of the body.[156] The diagnosis must be established by roentgenographic findings and demonstration of iron in expectorated pulmonary cells.

Iron Overloading Disorders

The terms *hemochromatosis* and *hemosiderosis* are misnomers which have added confusion rather than exposition to the iron overloading disorders. The iron overloading disorders should be classified into an *idiopathic* variety in which the basic etiology is unknown and a *secondary* group associated with other diseases which cause iron deposition in various portions of the body (Table III and IV). In many of these disorders quantitative measurements of the iron overloading occurs if the quantity of iron entering the body consistently exceeds loss. In contrast, relative or focal siderosis can result from redistribution of body iron. Thus an elevated serum iron concentration and siderosis of one body organ are insufficient to establish a diagnosis of generalized massive iron overloading. The generalized distribution of excessive body iron should be demonstrated by stains of biopsy specimens and multiple organs such as the skin, stomach, small intestine, bone marrow and liver. The massive nature of the iron overload can be quantified by bleeding the patient until he becomes iron deficient; phlebotomy of 500 ml of blood with a normal hemoglobin concentration (15 g/100 ml) depletes the body of 250 mg of iron (1 g hemoglobin contains 3.4 mg iron).[157]

Every patient with suspected iron overloading should be questioned about previous parenteral iron therapy and blood transfusions and for a family history of anemia, diabetes, cirrhosis or cardiac insufficiency. Blood relatives should be examined for anemia and evidence of iron storage disease. The blood of both the patient and his family should be tested for hyperferremia and the presence or absence of microcytic hypochromic erythrocytes.

Idiopathic, generalized massive iron overloading (hemochromatosis)[100, 158-168] is a familial disorder in which excessive amounts of dietary iron are absorbed and accumulate in various organs of the body to produce tissue damage. Usually, the disease becomes manifest during the fourth to sixth decades of life as cirrhosis, diabetes mellitus, heart failure or pigmentation of the skin. Hemochromatosis should be suspected in patients with any

	Genetic	Hemolytic	Serum Iron	TIBC	Iron Store	RBC FE Incorporated	Special Tests

of these findings and considered probable if two or more of this tetrad coexist. This probability is supported by an elevated serum iron which almost completely saturates the total iron binding capacity. However, the diagnosis cannot be established with certainty until the massive and generalized nature of the iron overload are demonstrated in patients with normocytic red blood cells who have no history of multiple blood transfusions or prolonged and excessive dietary intake of iron. Although the generalized nature of the iron overload can be established by examination of stained biopsy sections from multiple organs, we believe iron stains of small intestinal biopsy specimens provide the most reliable information. The lamina propria of the duodenum and jejunum do not contain excessive deposits of stainable iron until the patient has a 10 g body store. Excessive deposits of iron in the skin and gastric mucosa can be found following a hematoma or gastritis. The bone marrow contains relatively little iron in idiopathic hemochromatosis, and the liver shows excessive deposits of iron in certain patients with Laennec's cirrhosis. Massiveness of iron overloading is demonstrated by tolerance to repeated phlebotomy; normal subjects develop iron deficiency anemia following a loss of 2 to 3 liters of blood, whereas, most hemochromatotics tolerate a 50 to 100 liter blood loss before they develop a sustained anemia with hypoferremia and depletion of iron from their tissue stores. Energetic phlebotomy should be undertaken to reduce excessive deposits in organs of the body and prevent further tissue damage. In hemochromatotics under 40 years of age, blood letting should be considered a medical emergency because of the frequency of sudden death from cardiac arrhythmias. In older patients the disease usually becomes manifest as cirrhosis, diabetes or congestive heart failure.

(1) Dependent upon underlying etiology (2) Hypersplenism may be present.

Most hemochromatotics tolerate blood letting at a rate of 2 or 3 pints weekly. This can be continued until the labile stores have been depleted and then a slower rate of blood letting must be utilized. The period of vigorous phlebotomy usually removes about three fourths of excessive iron deposits. Depletion of this readily available iron pool can be detected by the inability to maintain the hemoglobin concentration, the development of reticulocytopenia and depression of the serum iron concentration with continued blood letting. However, excessive quantities of iron are found in tissue specimens and cessation of phlebotomy is followed by a rapid return of the hemoglobin concentration and serum iron to prephlebotomy values. Continued blood letting at a slower rate permits depletion of the less easily mobilized iron stores. Once this occurs a more prolonged period of iron deficiency ensues and the liver and bone marrow contain no stainable iron. Certain investigators have questioned the efficacy of blood letting in the treatment of idiopathic hemochromatosis. However, untreated hemochromatotics have a progressive downhill course with death caused by cirrhosis, hepatic carcinoma, diabetes mellitus or cardiac dysfunction. Conversely, removal of excess iron by energetic phlebotomy produces marked improvement in hepatic, pancreatic and cardiac function within months after its induction and eventual disappearance of histologic evidence of cirrhosis. Iron stores should be maintained at near normal levels for the remainder of the patient's life. Once excessive stores have been depleted this can usually be accomplished by quarterly donations of a pint of blood. The biochemical lesion causing idiopathic hemochromatosis has not been identified. Studies of the rate of repletion of iron stores by hemochromatotics indicate that these patients accumulate approximately 3 mg of iron each day. Thus, the basic defect of this disease causes increased absorption of iron and decreased excretion until a massive store is accumulated. Whether the defect is a generalized abnormality of epithelial cells or a relative inability to mobilize stored iron is unknown.

The secondary iron overloading disorders should be classified into a group in which there is generalized massive siderosis and diseases which are associated with relative, limited or focal iron overloading. Secondary generalized massive iron overloading occurs following multiple blood transfusion, the injection of excessive quantities of iron, prolonged excessive dietary intake of iron and associated with microcytic hypochromic anemias in which there is a defect in hemoglobin synthesis. Blood transfusion is an important cause of siderosis because each pint of blood contains 250 mg of iron and maximal body excretion is limited to a net loss of about 4 mg daily.[100, 157] The Bantus have marked tissue siderosis from the ingestion of a diet that contains much iron and alcohol,[169] and in Manchuria generalized siderosis with polyarthritis occurs from an iron overloaded water supply. Patients with thalassemia major developed massive generalized siderosis, and this is worsened by repeated transfusions of these patients for their anemia.[170, 171] Cardiac arrhythmias are a frequent cause of death from this disease due to myocardial deposition of iron. The severity of anemia usually prohibits the use of repeated phlebotomy to lessen the iron overload. Parenteral administration of iron chelaters have been advocated to deplete the excess iron stores of patients with thalassemia major. The results of large long term studies are needed to ascertain if this relatively inefficient method of ridding the body of iron is worthwhile in the treatment of thalassemic patients. Usually these patients are easily identified because of their retarded growth skeletal abnormalities and a hemolytic anemia with microcytic hypochromic red blood cells. Studies of the parents show thalassemia minor; the trait is unassociated with massive iron overloading because these patients can increase excretory losses to balance their excessive absorption of iron.[172] Pyrodoxine responsive anemia and a sex-linked hypochromic anemia are associated with a massive generalized iron overload.[111, 112, 173] Unlike thalassemia these patients do not have evident physical deformity because the disease does not become manifest until adult life. These disorders are characterized by a microcytic hypochromic anemia without hemolysis, ineffective utilization of iron for hemoglobin synthesis, an elevated serum iron and tissue siderosis. In one group of patients, large doses of pyrodoxine improve the anemia and increase the incorporation of iron into hemoglobin. The presence of anemia usually brings these patients to the physician before marked tissue fibrosis occurs. However, pathological changes similar to idiopathic hemochromatosis can occur and have been reported to cause death. Patients with pyrodoxine responsive anemia and sex-linked hypochromic anemia usually tolerate phlebotomy at a rate of one pint of blood weekly. Blood relatives should be examined for evidence of the disease so that excessive iron can be removed by

phlebotomy before tissue damage occurs.

Relative, limited or focal siderosis produce insignificant changes in the total body iron but marked alteration in the distribution of iron within the body. Limited iron loading is found in polycythemia and many hemolytic disorders because increased absorption of iron occurs in response to accelerated production of hemoglobin. However, once body requirements are satiated, losses keep pace with absorption to prevent accumulation of a massive store. In aplastic anemia, much of the heme-iron from destroyed red blood cells is not reutilized for hemoglobin synthesis. This excess iron is deposited in body stores to cause tissue siderosis without significant change in the total body iron content. Patients with pancreatic insufficiency secondary to chronic pancreatitis or cystic fibrosis develop moderate and limited hepatic siderosis from increased iron absorption. This is probably caused by the absence of pancreatic secretions such as bicarbonate which precipitate and polymerize iron to reduce absorption from the lumen of the gut.[42, 77] In certain disorders increased amounts of stainable iron are deposited in a solitary organ without an increase in the iron content of other body tissues. This occurs in the kidneys of patients following intravascular hemolysis,[174] the lungs in pulmonary hemosiderosis,[175] and in the liver of certain patients with Laennec's cirrhosis. Patients with Laennec's cirrhosis and limited or focal siderosis may be difficult to distinguish from other patients with diseases in which there is massive generalized iron overloading. The liver of certain cirrhotics contains large quantities of stainable iron. In addition, the serum iron may be markedly elevated with a bone marrow that contains many sideroblasts. However, biopsy specimens from other organs such as the skin, the stomach or the small intestine show normal quantities of stainable iron, indicating that the iron overload is not generalized. That the iron store is not massive can be shown by bleeding these cirrhotics until they become iron deficient and their liver is depleted of stainable iron; usually iron deficiency is induced by phlebotomy of 10 pints of blood. The etiology of these findings of focal iron overloading in certain cirrhotics is worthy of comment. Many red blood cells containing siderin particles are produced by the bone marrow of these patients. Shortly after these cells are delivered into circulation, the spleen removes the siderin from intact erythrocytes to cause accelerated iron turnover and an elevated plasma iron concentration with excessive deposition of iron in the liver.[110, 176]

The other forms of focal siderosis are usually not confused with generalized massive iron overloading. Renal siderosis is caused by hemoglobinemia and pulmonary siderosis occurs from bleeding into the lung. Sequestration of iron in the kidney or the lung and loss of iron in the urine or sputum depletes other tissues of iron and cause changes suggestive of iron deficiency rather than iron overloading.

Summary

Body-iron is maintained by a delicate balance between absorption and excretion in which absorption plays a more active regulatory role. The intraluminal, mucosal and corporeal factors affecting the absorption of ferrous, ferric and hemoglobin iron in normal and various disease states were discussed. Limited but selective excretion of iron occurs from the gut and skin; it attempts to reestablish a normal body-iron content following therapy with excessive parenteral iron and in hemolytic disorders with enhanced iron absorption. The etiology, investigation and treatment of patients with iron deficiency and iron-overloading were described. The pathophysiology of abnormal states of iron repletion was discussed and related to factors which affect the body iron content.

SOME APPARENTLY COMMON PROBLEMS IN PATIENTS RECEIVING CONTRACEPTIVE PILLS

PHILIP BALL, MD
Department of Medicine
Ball Memorial Hospital
Muncie, Indiana

This article is in the nature of a warning to physicians prescribing the so-called contraceptive pills whether for the purposes of pregnancy prevention or for the treatment of gynecologic disorders including dysmenorrhea, endometriosis, dysfunctional uterine bleeding, menstrual irregularity, etc.

It is felt that the side effects of depressive symptoms and also malaise, fatigue, tension, lack of libido and acceleration of vascular type headaches during administration of these pills is a more frequent problem than believed by most physicians. This article is based on an unscientific sampling of some 30 cases recalled "out of thin air" from an internist's office practice. It is believed that the symptoms concerned are intangible enough that they would not be well identified in a mass survey—particularly if this were of a population in a backward "test country" or a population group which was only casually or superficially surveyed. It is also true that the symptoms are common enough in any case so that perfect proof of relation of the symptoms to contraceptive medication is not easy.

The author has also seen several cases of thromboembolic disease and several cases of erythema nodosum in patients on contraceptive pills, but feels that these are infrequent problems as compared to those which are the concern of this article.

Report of cases in which contraceptive medication seemed to be provocative of major symptoms

CASE 1. Patient was first seen February 13, 1965 complaining of headaches occurring in cyclic fashion, severe in nature, and often accompanied by nausea, vomiting, and photophobia. Patient had been on norethynodrel with mestranol, 5 mg, for three years. Treatment as for migraine was carried out. On September 23, 1965 the patient was seen complaining of symptoms of depression and tension of several years duration. The patient also stated her migraine had been severe for several years. Again it was noted she had been on norethynodrel with mestranol, 5 mg, approximately three and one-half years. At this time the patient was advised to take a vacation from her contraceptive medication and use some old-fashioned technique for pregnancy prevention. The patient was next seen on February 24, 1966 and she stated that the depression, tension and migraine headache seemed to abate promptly when the contraceptive pill was stopped. The patient stated that until she had quit the contraceptive pill she felt that "I had made a mistake in my marriage or married the wrong man or marriage was not for me" and the patient stated that now she was "happy, marriage was wonderful and I had no idea it could be this wonderful." The patient was last seen on July 8, 1966 and was continuing to feel quite well and had no complaints.

CASE 2. The patient was seen on July 22, 1965 complaining of fatigue and some intermittent depression which had been present for one year. She had been on norethindrone with mestranol, 2 mg, for one and one half years. No physical problems were identified on complete examination and she was advised to stop the contraceptive and was given desipramine 25 mg four times daily for a few days. The patient was next seen on August 21, 1965 feeling very well in all respects. She stated she was "better than in a long time. Everybody notices it." She was advised not to resume the contraceptive medication.

CASE 3. The patient was seen on September 29, 1966 complaining of being "run down, grouchy and irritable" since October 1965. She also complained of chronic fatigue and loss of normal libido. She had been on chlormadinone with mestranol since October 1965. She came to me at the insistence of her husband. She was advised to stop the contraceptive pill. No other medication was prescribed. When seen one month later she had no residual complaint.

Report of cases in which the patient switched from one of the older formula contraceptive medications to one of the so-called second generation type sequential contraceptive pills

CASE 1. The patient was seen on August 30, 1966 complaining of headaches which had been quite frequent for six months. They often occurred as often as three times per week. They were usually right sided and often associated with some scotomata and nausea. She also complained of some mild depressed feelings during the previous 12 months. Interrogation about medication revealed that the patient had been on chlormadinone with mestranol for the past 12 months. Prior to that she had been on norethindrone with mestranol for nine months and prior to that had been on norethynodrel with mestranol. It appeared that the sequential type had been associated with the period of greatest symptomatology.

CASE 2. This patient according to her statement was started on norethynodrel with mestranol, 5 mg in January 1965. She was married in February 1965. On May 19, 1965 she consulted me complaining of fatigue, irritability, depression, and frequent generalized headaches. She was advised to take desipramine 25 mg three times daily after meals. On May 29, 1965 she stated she felt somewhat improved. She was advised to stop norethynodrel with mestranol and start chlormadinone with mestranol. When seen on September 30, 1965 she stated she was somewhat improved in reference to the depressed feelings and headaches. She discontinued all contraceptive medication in January 1966 in order to become pregnant.

Report of cases in which contraceptive medication seemed to be aggravating an already existing depressive problem

CASE 1. This patient had been hospitalized for neurotic symptoms and depressive reactions as far back as 1958. This condition was severe enough to require care under a psychiatrist in a psychiatric unit. She continued to be troubled with various emotional symptoms especially those of depression periodically. The symptoms seemed to be considerably accelerated between 1962 and 1966 and she was almost constantly under psychiatric care with multiple drugs, group therapy, discussion therapy, etc. History was given to me on July 2, 1966 by the patient that she had been on contraceptive medication since 1962. She took norethynodrel with mestranol from 1962 until 1965 but discontinued it because of "constant vomiting." She was next put on norethindrone with mestranol by another physician and took it for approximately one year but discontinued it in February 1966 because of an increase in headaches which she was convinced had been caused by the drug. Emotionally the patient has been better since February 1966 when all contraceptive medication was discontinued.

CASE 2. This patient had been under psychiatric care for some six years for presumed schizophrenic reaction marked chiefly by depressive symptoms. At her request she was started on norethynodrel with mestranol, 5 mg, as a contraceptive measure on April 1, 1964. The treatment with this drug was marked by considerable breakthrough bleeding, nausea, increased fatigue and breast soreness. She continued with this medication however and on March 5, 1965 was complaining of severe headaches. She stated that headaches had been recurrent since age 18. However, they had been much more frequent in the past eight to nine months. They were usually of generalized pounding type with blurred vision, nausea, dizziness, etc. During this period of a year the patient was in and out of a psychiatric unit on several occasions. Her depressive symptoms were much more marked. In the latter months of 1965 the patient discontinued the medication on her own advice because she was convinced it had aggravated her depression. She has been somewhat improved since that time.

Report of cases in which contraceptive medication seemed to have been provocative of major symptoms but the patient would not discontinue medication

CASE 1. This patient was seen on June 2, 1966 complaining of weight gain of 15 pounds in eight months, also of sluggishness, tiredness, tension and depression especially in the preceding eight to 12 months. The patient had been on norethynodrel with mestranol, 25 mg, since November 1965. The patient also stated that since the taking of this medication she had been sexually disinterested. Complete physical examination was entirely negative except for chloasma. The patient was advised to stop the contraceptive medication because of multiple probable side effect problems. The patient stated that this was impossible. She said that both she and her husband would not be satisfied with anything less than 100% assurance against pregnancy. She stated that she and her husband (both of whom were 23 and had been married one and one half years and had one child) did not wish any more children "ever." The patient said that unless I could see that her husband was operated to render him sterile she could not under any circumstances discontinue the pill no matter what it caused.

CASE 2. This patient began norethindrone with mestranol in June 1964. When seen on September 29, 1966 she stated fatigue had been constant since the fall of 1964. Also, she had gained considerable weight and felt herself to be 25 pounds above desirable weight. She also had chloasma. She wanted to lose weight, then discontinue the contraceptive, and have another baby—in that order. She felt that she couldn't lose so long as she took the contraceptive pill and couldn't afford to get pregnant as overweight as she was. When previously treated elsewhere, she had been told to continue the birth control measure and take an anorectic pill, diethylpropion hydrochloride. So, I saw her as a female who was fat, fatigued, pigmented, infertile and confused as to what to do next. I told her to stop all pills—but she remained fearful and dubious when last instructed.

Discussion

It should be pointed out that the author has not prescribed these pills for contraceptive pur-

poses for some two years, hence he is not often seeing these problems in patients to whom he has given the prescription but rather in patients who have been given the medication by other doctors.

All of the side effect symptoms mentioned in this article are mentioned in contraceptive drug information pamphlets, yet it is not considered unusual that more physicians have not warned urgently of these side actions. It should be pointed out that these medications have been in general use scarcely seven years. Yet it took some ten years to realize some of the major drawbacks of long term use of cortisone in rheumatoid arthritis. It probably took 40 years to realize the problems of aspirin usage in people with recurrent duodenal ulcer. Many physicians today are still not well aware of the depressive potentialities of rauwolfia drugs even after 15 years of use of this type drug.

Further it should be pointed out that any moribidity from these pills occurring in a healthy woman in whom they have been prescribed for purely contraceptive purposes is a violation of the medical maxim "Primum non nocere." Such pure contraceptive application of the pill may be seen in a teenage girl about to be married, who instead of simply getting happily married, gets married and then gets sick. The pill may be applied in a 30-year-old happily married women who wants to become infertile and instead becomes infertile and unhappy. The pill may be given to a 45-year-old woman who wants to "stay young forever" and has been granted this option by a physician who believes that the contraceptive pill formula given in a cyclic fashion will help her stay youthful, happy, confident, regulated and young forever and ever. Hence there is offered the risk of a drug's morbidity to a woman who has no disease. This is considerably different than offering the risk of penicillin allergy to a woman who has pneumonia, or the risk of digitalis toxicity to a woman who is in cardiac insufficiency, or the risk of pyloroplasty and vagotomy to a woman who has recurrent bleeding from duodenal ulcer. Of course in cases where the contraceptive pill formula is used for treatment of a pelvic disease problem then the morbidity of the drug can be rightly weighed against the morbidity of the disease.

Actually, I don't believe the contraceptive pills are responsible for all of the fat, fatigued, fussy, fluid-filled, infertile, phallus-fearing females in the country. Maybe they are only causing one fourth of these problems.

A peculiarity pointed out is that these pills, when properly used, are essentially 100% perfect insofar as their efficacy in preventing conception. On the other hand their safety is certainly not 100%. The drugs then must be weighed against the use of some other contraceptive modality which may not be 100% efficacious but which is 100% safe in terms of morbidity. It is rather ironic that some women are not willing to trade 100% efficacy for 100% safety. It is unusual in practice to have patients so fiercely in favor of a pill that they will get them from some other physician and take them in spite of strong contrary advice and even in the face of the woman's own adverse experience. On the other hand the author has been fascinated to see that several women have come into his office recently asking for advice about the stopping of the pill and the starting of some one of the other old-fashioned measures. This picture contrasts sharply with some three to five years ago when his appointment book was often spotted with the names of women coming in to get off the old-fashioned contraceptive program and go on the pill. Tempus fugit.

A minor observation of the author has been that patients having migraine while taking contraceptive medication seem refractory to the usual preventative and treatment preparations for migraine.

Another problem has been the medical subdivision of the American patient. Certainly the American female patient is staked out in sections in most medical communities; hence the hand that writes the prescription for the contraceptive medication may not be the hand that does the Papanicolaou smear and pelvic exam nor yet the hand that writes the prescription for antidepressant pills and antimigraine drugs. I have observed repeatedly that women will get their contraceptive pill prescription from one physician and when the side effects occur consult another doctor in reference to the problem. This second doctor may not know what, if any, other medicines the patient is taking unless he asks. It is certainly true that the left hand does not know what the right hand does, nor yet what the "pill" is doing.

It is not considered reasonable that there be any mortality or morbidity in a pill used purely for contraception purposes. Medical research has got to offer something better than this. It is believed that physicians will look back on this contraceptive pill era of the past five years with some embarrassment.

Reports of cases in which contraceptive medication had possibly been the cause of major side effects and for which the patient came to a doctor to have the medication stopped but he would not

CASE 1. Patient was first seen on September 28, 1966 in the psychiatric wing of a general hospital. The patient had been admitted for tension and depression symptoms which had begun some 12 months before. The patient stated that she had been started on norethynodrel with mestranol some 15 months before—that is about three months prior to the start of the depressive symptoms. A few months after the onset of the depression she consulted the physician who had started the contraceptive medication and asked him if it were possible the pills could be causing her to feel so badly. He advised her it was not possible and she continued the medication for another few months. She then discontinued it on her own.

CASE 2. The patient was seen on July 15, 1966 complaining of bloating, weight gain of ten pounds in one year, also frequent headaches. These headaches were often occurring twice weekly, were frontal in location and were associated with nausea and vomiting. The patient also complained of lack of energy and a chronic fatigue in the past six months. She had also observed a lack of libido in the past six months. The patient had consulted another physician in February 1966 and asked whether the headaches and lack of energy could be related to the taking of norethindrone with mestranol, 2 mg, which she had been on since approximately July 1965. He told her this was not possible, but she discontinued the medication and when seen two weeks later had already experienced some relief from her major symptoms.

Abstract

In the past two years in his office practice as an internist the author has seen cases of major side effects in patients receiving contraceptive pills. These side effects included symptoms of depression, fatigue, tension, lack of libido and acceleration of migraine type headaches. The author feels that these problems are more common than believed and that physicians should recheck patients on contraceptive type pills carefully at six-month intervals using a check list of the contraindications, warnings, precautions, side action and dangers as listed in any of the literature accompanying the medications themselves or their promotional advertising.

FAMILY REHABILITATION AS AN OBJECTIVE OF COMPREHENSIVE CARE FOR CHILDREN

OSCAR C. STINE, MD, DrPH
Associate Professor of Pediatrics
University of Maryland
Community Pediatric Center

Changes in family composition, income and housing were common in a sample of 203 families served by the Maternal and Child Health Clinic of The Johns Hopkins School of Hygiene and Public Health.

One family characterizes the 70% of the families whose conditions improved during enrollment and a second family characterizes the 11% of the families who suffered adverse changes leading to welfare dependency. In the latter, the family's ability to meet the needs of their children deteriorated until it dramatically terminated in emergency placement of all children in foster homes. This progressive deterioration was accompanied by more frequent diseases among the children and by a poorer pattern of utilization of medical services. In contrast, the successful family had decreasing frequencies of disease in their younger members, and increasingly appropriate utilization of medical services.

To state how the social adjustment of these two families were effected by comprehensive health services, it appears necessary to go beyond basic clinical observations. Ecologic, sociologic and psychologic subjects for study are suggested by public health nursing, social work, and pediatric reports. Application of these sciences may document the impact of the practicing physician or of comprehensive health services on family rehabilitation.

Family composition, interpersonal relationships within the family, and the home environment undergo changes during the time that a child or family is known to a health agency. Practicing physicians and other professionals who seek to maintain a relationship with a family beyond a single disease episode assume that advice about health, social services, referral to community agencies and counseling will have favorable effects upon these changes. The ultimate effect of a continuation of these efforts in a multi-problem or "hard core" family may be called family rehabilitation. Such an objective seems so remote from giving immunizations, treating sore throats, teaching a mother to prepare a formula, that it is rarely included in the stated objectives of a pediatric service. Even the objectives of family case work in hospital, child guidance, or educational settings, tend to state their objectives in terms of the index child or the crisis that brings the family to the social service. The total effect on the family of multiple small services over an extended period of time rarely provides the basis for financing services. The relationship between the specific service given to an individual in the family and the eventual successful development of that family may be both a tacit assumption and a motive of the professional persons but has not become part of the evaluation of our services.

Purpose

The purpose of this paper is to outline the ten-year experience of a comprehensive clinic as a context for two family case histories which will dramatize the magnitude of changes which families undergo and which will suggest instances in which comprehensive services participated in the family's success. Elementary observations of case histories suggest methods of measuring changes in a family that either contribute to the child's pathology or that reflect the value of professional assistance in family rehabilitation.

The Comprehensive Care Program

The Maternal and Child Health Clinic of The Johns Hopkins School of Hygiene and Public Health opened in 1952 as a home and office-care clinic with pediatric, public health nursing, social work and psychological testing services. Families were invited to attend the clinic if they were eligible for ward medical care, lived in a low income area of the city, were members of the Negro race, the parents were married, and they were not on welfare. These admission criteria were selected to maximize the opportunity for long range observations of families. If parents separated, or if their economic condition changed, the children continued to receive comprehensive services, unless they moved beyond the specified boundaries within the city. Services were given in the home and in the clinic. Treatment of acute illness, follow-up of a chronic disease, as well as well-child services, were given free of charge.

Population

Three hundred and thirty-three families were admitted during the first ten years of clinic operation. After 12 years 223 families were either attending the clinic or were still located in Baltimore. Two hundred and three of these were available for an interview in their home by a social worker who recorded detailed information about their current socio-economic status. Ninety-four of these families had attended the clinic for more than ten years. The families who were not interviewed included those that were not at home on three separate visits by the interviewer or had attended the clinic less than two years.

Results

Socio-Economic Changes in 203 Families:

At the time of the survey 33 of the mothers were widowed, separated, or divorced, without remarriage. Eight mothers had remarried. Eight of the original mothers were no longer with their children because of death, divorce, or desertion. In 33 families one or more children were living in another home or in an institution. Although 22 families were supported by welfare at the time of this survey, because of illness or absence of the father, 92 families were earning between $5000 and $10,000 per year. Eighty-eight families were buying their homes. Thirty-one fathers and 49 mothers obtained further education during their period of clinic enrollment. Over 70% of the families reported that their financial conditions had improved since clinic enrollment.

Family Social-Medical Histories:

The following medical histories of children born at five year intervals in two families will illustrate some of the relationships between the family's changing social conditions and the child's health. Both families received comprehensive health services between 1952 and 1966.

The J Family

Mr. and Mrs. J were born in rural areas of southeastern states. They came to Baltimore as young adults. Each had had one child by a previous marriage. Mrs. J was 21 and Mr. J was 35 at the time of their marriage. One year prior to entering the clinic, Mrs. J had active tuberculosis that was adequately treated in a sanitarium on an out-patient basis. They reported no other contagious, familial or allergic diseases. Mr. J was a laborer in a steel plant. Mrs. J occasionally took work as a domestic. They lived in a 12-foot wide row house entered by poorly repaired wooden steps, heated by kerosene-burning space-heaters, located on a narrow street with a small grocery store on one corner and a bar at the other corner of the block. Mr. J continued with his job at the steel mill. In their fifth clinic year the family moved to a new house 18 feet wide, with porch, front lawn and shrubbery.

Physicians made visits to the home for one communicable disease, two acute illnesses, for one family conference, and in two instances to see newborn infants. Mrs. J kept all appointments for well child visits and follow-up of illness. She asked for family planning advice and used either diaphragm or a contraceptive cream. Her husband desired a large family. She had normal pregnancies in the fourth, sixth, and ninth clinic years. She had a non-medical septic abortion which was treated in the medical center in the tenth year of enrollment in the clinic. She then obtained tubal ligation. Her seven pregnancies had resulted in six living children born within fifteen years.

Deborah J—Born at Time of Family's Admission to Clinic

Deborah was the result of her mother's third pregnancy; it was complicated by pyelonephritis. She weighed 2800 grams at birth. For the first two years of life, her weight followed the 50th percentile growth curve. By the fifth year of life, it reached the 75th percentile where it remained and was typical of the slightly above measurements of her growth and development. Her illnesses in the first five years of life included three occasions when insect bites were severe enough to warrant medical attention. At age two, she had a burn on her leg which progressed to severe cellulitis requiring hospitalization. In her third year, she had episodes of impetigo, rubeola, varicella, mumps, and rubella. Mild atopic eczema first appeared at age five. In Deborah's second five years, she had one episode of acute pharyngitis and an occasional mild upper respiratory infection. She developed myopia which was corrected by glasses. Her teacher described her as the smartest girl in the class.

Gary J—Born in the Sixth Year of Clinic Attendance

Gary's prenatal experience was uncomplicated. His weight curve fluctuated between the 50th and 75th percentile. He had atopic eczema in his first two months of life but has since been free. At age four, he developed ringworm of the scalp. At age five, he injured his hand with a screw but the resulting infection was promptly treated. He had a paronychia of two fingers which he sucked habitually at age five. The mother was not alarmed at the finger sucking which the child gave up after two more years. One episode of otitis media was the only illness beyond minor respiratory infections.

The H Family

Mr. H was born in rural North Carolina. Mrs. H has always lived in Baltimore. At the time of their marriage, Mrs. H was 14 years old and Mr. H was an 18 year-old Marine Corps private. They had been married four years when they were registered in the clinic at the time of the birth of their fourth child, Richard. Mrs. H had rheumatic fever at age eight but has had no recurrence. Mr. H had a gonococcal infection and a hospitalization in the Veterans Hospital for fainting spells in the recent past. Following discharge from the service, he worked in a steel mill, a shipyard, a cooperage, and in construction work. Mrs. H occasionally took work as a domestic. Their home was a four-room row house heated by a gas stove in the same neighborhood as Family J. The furniture was in poor condition. The house was dirty and often filled with flies.

Mr. H had already had difficulty in keeping a job. After recurring hospitalizations for lymphadenitis and pleural effusion caused by an atypical mycobacterium, he had increasingly longer periods of unemployment. On several occasions, he left the home for more than one month. He increased his use of alcohol and became abusive to his wife. The family moved

to public housing in a high-rise apartment and later moved to a two-story apartment in public housing.

Mrs. H was pregnant each year with only two exceptions. After attending the clinic one year, Mrs. H made repeated requests for information about family planning and complained frequently of too many children at too young an age. She was unable to keep several referrals. When she obtained a diaphragm, her husband criticized its use. In the sixth clinic year, she requested a tubal ligation but her husband could not be found to sign the permission for operation. After that, tubal ligation was planned several times but not completed until the eleventh clinic year. A septic abortion in the ninth clinic year was one result of multiple delays. The causes of interruption of these plans included a primary tuberculosis infection, inability to obtain a housekeeper for the children, and insistence by one hospital on hysterectomy (which was refused) instead of the ligation.

Mr. H left the family in the fifth clinic year and subsequent pregnancies were the responsibility of a Mr. R who married Mrs. H in the twelfth year of enrollment. After the desertion of Mr. H, the family was dependent upon welfare support except for money given by Mr. R for his own children. In spite of being on welfare, the oldest boy received a new bicycle at age 10. Although free medical services were available, the family did not obtain an operation for a large umbilical hernia, removal of a nevus on the sole of the foot, and needed glasses for members of the family. The family made many night telephone calls to physicians. Two children received as many as nine house calls. With Richard, whose history will be presented, Mrs. H broke 10 appointments out of 24 given for well child care and follow-up visits in five years. Out of 19 appointments given to the eleventh child, nine were broken. School attendance of the children became increasingly irregular; the older children sometimes stayed home to care for younger ones or to take small jobs. In the twelfth year of enrollment, Mrs. H was jailed two months for shoplifting and her 12 children were placed in foster care.

Richard H—Born at Time of Family's Admission to Clinic

Richard was the result of a pregnancy complicated by a syphilitic infection which was treated in the third month of pregnancy. His growth in the first year of life followed the curve of the 50th percentile but fell to the 20th percentile in the second year. In his second year of life, his mother complained that he was a restless sleeper. In his first five years of life, he had two episodes of otitis media, a burn of the arm and hand from a space heater, two falls down a full flight of stairs, a laceration of his tongue from another fall, paronychia of the big toe, rubeola, mumps, and one illness with angioneuotic edema.

Valerie H—Born in the Fifth Year of Clinic Attendance

Valerie was the eighth child in the family. Her illness experience in the first five-year period was more severe than her brother in his pre-school period. In spite of this, her weight curve stayed in the 60th percentile. By age one, she had had hemophilus influenza conjunctivitis, and three episodes of acute bronchitis. In her second year, she had varicella, bronchopneumonia, acute bronchitis, and at least four episodes of pharyngitis. In the next three years, she had two episodes of pneumonia, two attacks of bronchitis, and two of acute pharyngitis. She was also treated for iron deficiency anemia.

Earl H—Born in Tenth Year of Clinic Attendance

Earl was the twelfth child in the family. He gained rapidly for the first year but gained only one pound in the next nine months. In the next two years, he had streptococcal pharyngitis, otitis media, two episodes of bronchopneumonia, a second degree burn on his back, and ringworm of the scalp. His frequent illnesses and frequent broken appointments allowed him to receive only two immunizations.

Discussion

These case histories illustrate some of the factors influencing changes which occur in families. The financial changes are obvious as well as the changes in family composition. Family J has had increasing financial success and increasing experience in parental cooperation while Family H has had decreasing success in both areas until they reached complete dependency, disorganization of the original marriage and sepa-

ration of the children from their mother. Both fathers objected to family planning practices: Mr. J stated that he enjoyed his children and hoped for a large number of children around him; Mr. H criticized his wife's method of controlling conception. Counseling with Mr. J was successful. Mr. H could hardly be reached. The second father for Family H has made definite efforts to take increasing responsibility for his children; employment counseling may play a crucial part in helping this family regain financial independence and cooperative parental roles.

The mothers' personalities were powerful determinants of the health experience of the children. Mrs. J's use of medical services illustrates organized purposeful effort. Mrs. H appealed to the sympathy of professional persons but was often disorganized and aimless in obtaining care. When the children were in obvious discomfort, we comforted them and brought them to the physician. Confronted with failures to get immunizations or to get the children to school, she described the difficulties that beset her and the things the children wouldn't do; the causes seemed outside of her responsibility.

Both families experienced tuberculosis. The chronic illness with a mycobacterial infection disrupted Mr. H's employment and probably affected his relationship with his family. Whether or not Mrs. J's tuberculosis disrupted her first marriage is not clear. Yearly skin tests of the J children demonstrated the vigorous health service necessary to assure this family of protection from TB. The activation of Mrs. H's TB following a pregnancy and the primary lesion in the son could have had disastrous effects if not identified at that time. Mrs. H's poor use of prenatal care probably prevented its earlier recognition.

The frequency of night house calls to the H family and the absence of such calls for the J family is consistent with the dependent personality of Mother H or consistent with her vacillation between responsible adult action and self-pity.

Measurement of Changes in a Family:

Medical literature is making increasing use of measurements of social class. These technical instruments would be valid in describing the upward mobility of the J family and the downward social mobility of the H family. They would employ the data included on family income, the nature of employment of the father and characteristics of the housing.

The specific observations added by physicians, public health nurses and social workers on home visits are relevant to sources of accidents, burns or contaminating filth. They also include information on the patterns for sleeping, eating, clothing, gift giving, work-assigning and playing. These observations may be included in an ecological description of the family but they were obtained in these families without benefit of the systemization for methods of measurement from the science of ecology. The present use of the information is for clinical deductions concerning accident prevention, health advice, interpersonal relationships and the personalities of the parents and children.

The observations of the home are important to the physician in adapting his recommendation to the circumstances and abilities of the persons involved. The validity of his deductions may be low even when he has as many observations as this clinic had of the H family. The deduction that Mrs. H had a dependent personality is based upon instances in which she elicited assistance, support, favors or gifts from other persons, and other instances in which she did not take responsibility for independent action. Although this may be useful it may be erroneous unless the observers were given systematic instructions by psychologists and/or sociologists to make such classifications and to relate the classifications to behavior affecting health.

Among the differences between these two families is their behavior in planning the size of their families and their adaptation to a large number of children in the home. This behavior and adaptation went through a series of stages employing different birth control techniques and different levels of concern for the size of the family. The description of these stages are relevant to the social science of family development and to the services for family planning and population control.

These comments invite further participation by ecologists, sociologists and psychologists in the study of child health. Improvement of methods and practices for increasing precision of observation may serve to document the impact of the practicing physician or a comprehensive health service on the social changes of the families that they serve.

YOUR MEDICAL FACULTY AT WORK

John Sargeant
Executive Secretary

The Executive Committee at its March 7, 1968 meeting took the following actions:

1. Authorized payment of expenses of the Emotional Health Committee chairman to attend a national meeting in Chicago; and a representative of the subcommittee on Medicine and Religion to attend a regional meeting in New York City.
2. Heard a report from the Parliamentarian requiring that physicians who were members at the time of the 1965 assessment are now required to pay that assessment in order to be currently reinstated to membership.
3. Authorized the Public Relations Chairman to serve as an advisor from the Faculty to the Student American Medical Association, University of Maryland Chapter.
4. Made recommendations for possible appointments as:
   a) Medical Advisory Committee, Division of Vocational Rehabilitation, for the Eastern and Western Districts of the State
   b) Board of Physical Therapy Examiners
   c) Advisory Council on Hospital Construction
5. Heard that the Blue Shield Board has voted not to make payments directly to lay laboratories.

Physicians are reminded of the portion of the Medicolegal Code of Cooperation pertaining to Reports to Patient or his Attorney which reads as follows:

> "The patient, or his attorney, upon written request, when accompanied by a signed authorization from the patient, shall be entitled to a prompt report from the attending physician, containing the history, physical condition, diagnosis, and prognosis, but need not include an evaluation of disability in Workmen's Compensation Cases. The physician's fee for such report should be commensurate with the time and effort devoted to its preparation."

This reminder is given because there have been many reports of insurance carriers advising physicians not to submit their medical reports to plantiffs' attorneys. If you have any questions, please contact the Faculty office for clarification.

Dr. Bard

Later this month, during the Annual Session of the American College of Physicians, Philip Bard, PhD, of Baltimore will receive the ACP Award for distinguished contributions in science as related to medicine.

PHILIP BARD PHD, TO RECEIVE ACP AWARD

Dr. Bard, an expert in neuro-physiology, is Professor Emeritus of Physiology at The Johns Hopkins University School of Medicine.

The distinguished physiologist was born in Hueneme, Cal. in 1898. He was a student at the Thacher School in Ojai, Cal., but migrated to the East for his college education. Dr. Bard received his AB from Princeton University in 1923, and his PhD from Harvard in 1927. He served as a Teaching Fellow and Instructor in Physiology at the Harvard Medical School from 1925 to 1928. From 1928 to 1931 he was Assistant Professor of Biology at Princeton then returned to Harvard for two years as Assistant Professor of Physiology and Tutor in Normal Medical Science. He was named Professor of Physiology and Director of the Department of Physiology of The Johns Hopkins University School of Medicine in 1933 and served in this capacity until 1964. In 1953 to 1957, he also served as Dean of the Medical Faculty; and in 1964 he became Professor Emeritus.

Dr. Bard is a member of the National Academy of Sciences, American Philosophical Society, American Academy of Arts and Sciences, Association of American Physicians, American Physiological Society (President, 1942-1946), American Neurological Association, Society for Experimental Biology and Medicine (President, 1956-1961), Association for Research in Nervous and Mental Disease (President, 1950), AAAS, Phi Beta Kappa, and Sigma Xi.

He is an honorary member of the Facultad de Biologia y Ciencias Medicas, University of Chile; Sociedad Argentina de Biologia; and Sociedad Medica de Santiago, Chile. From 1935 to 1946, Dr. Bard was a member of the National Board of Medical Examiners. During World War II, he served on three committees on the Military Medicine of the National Research Council.

Dr. Bard has been a Harvey Lecturer; Hughlings Jackson Lecturer, Montreal Neurological Institute; George Cyril Graves Lecturer, Indiana

University; Mitchell Lecturer, College of Physicians, Philadelphia; Glenn Millikan Lecturer, Vanderbilt University; and has received the Jacoby Award of the American Neurological Association; Karl Spencer Lashley Award in Neurobiology, American Philosophical Society.

Among his honorary degrees are listed DSc from Princton in 1947; ScD from Washington and Lee University in 1949; Doctor, Honoris Causa from the Universidad Catolica de Chile and the Universidad Mayor de San Marcos de Lima in 1951.

Dr. Bard has been a member of the Editorial Board of American Journal of Physiology; chairman, Editorial Board of Physiological Reviews; chairman, Board of Publication Trustees and Publications Committee of the American Physiological Society; Editor of and contributor to Macleod's Physiology in Modern Medicine, 8th, 9th editions; Medical Physiology, 10th and 11th editions. He has published about 60 papers on neural bases of emotional sexual behavior, postural reactions, localization of function in cerebral cortex, motion sickness, neural control of pituitary gland, temperature regulation and central nervous mechanisms involved in production of fever.

Dr. Bard was married in 1922 to the late Harriet Hunt, and is the father of two children, Virginia Hunt (Mrs. Moulton K. Johnson) and Elizabeth Stanton (Mrs. Jack P. Stephens). In 1965, he married the former Janet Mackenzie Rioch, MD.

Other Maryland doctors who have been named to receive awards this year include **Donald S. Fredrickson, MD,** Director of the National Heart Institute of the National Institutes of Health in Bethesda.

Dr. Fredrickson was this year's recipient of the American College of Cardiology's Convocation Gold Medal. Presented at the College of Cardiology's 17th Annual Scientific Session recently held in San Francisco, the medal was awarded with the citation: "In recognition of your dedication to the advancement of knowledge in the field of heart disease and your devotion to public service."

Bernard Weiss, MD, of The Johns Hopkins University, and **Joseph Wells, MD,** of the University of Maryland, have been awarded grants by Lederle Laboratories for their dedication to medical teaching.

The awardees were selected by a committee composed of seven leading medical educators under the direction of Maxwell Finland, MD, a George Richards Minot Professor of Medicine at Harvard Medical School.

The American College of Gastroenterology has announced the winners of the 1967 Rorer Awards.

Under the category of best unpublished papers, **Capt. William M. Lukash** of Bethesda, Head of the Gastroenterological Clinic of the National Naval Medical Center, won third prize for his work, "Rehfuss Fractional Gastric Analysis: A Study of Secretary and Motor Function of the Stomach."

For the best papers published for the year ending June 1967, third prize was awarded to **Vernon M. Smith, MD,** of Baltimore, for his paper, "Peritoneoscopic Cinematography."

Several appointments have been announced, including that of **Theodore Cooper, MD,** as Director of the National Heart Institute succeeding Donald S. Fredrickson, MD, who will return to the field of clinical investigation as Chief of the NHI Laboratory of Molecular Diseases.

Prior to his appointment as Director, Dr. Cooper served as the Associate Director and Chief of the Institute's Artificial Heart-Myocardial Infarction Program.

* * *

Sanford M. Bienen, PhD, has been appointed Special Assistant to the Director of the Mental Health Study Center in Adelphi.

A psychologist, and former assistant to the Director of Planning, Maryland Department of Mental Hygiene, Dr. Bienen is also a former member of the faculty of the University of Maryland.

The American Medical Association has reappointed the **Rev. William Loveless** of Takoma Park as a member of the Committee on Medicine and Religion.

The AMA Committee, composed of both physicians and clergymen, works to create the proper climate for communication between the physician and the clergy that will lead to the most effective care and treatment of the patient.

John J. Curry, MD, of Silver Spring, has been reappointed a member of the Council on Drugs of the American Medical Association.

Composed of medical experts appointed by the Board of Trustees, the AMA Council provides authoritative and unbiased information on drugs to the medical profession to encourage rational therapy.

The reappointment of **Harry M. Robinson, Jr., MD,** to the Subcommittee on Skin of the American Medical Associations' Committee on Rating of Mental and Physical Impairment, has been announced.

The Committee is developing a series of practical guides to assist physicians in evaluating permanent impairment. Each guide is prepared by a group of specialists concerned with the area of the body being considered.

The AMA Committee on the Medical Aspects of Automotive Safety has announced the reappointment of **Abraham J. Mirkin, MD,** of Cumberland as a member.

The purpose of this Committee is to develop medical information for the practicing physician, enabling him to advise and inform his patients concerning hazards which may result when the driver has abnormal physical conditions, certain diseases or emotional disturbances, or when he uses drugs and alcohol. The Committee supplies information to the public regarding medical conditions which may adversely affect driving proficiency, and encourages automotive designers and engineers to study and improve safety features in vehicle design.

Russell S. Fisher, MD, of Baltimore has been reappointed chairman of the Committee on Medicolegal Problems of the American Medical Association.

The principal areas of concern of this Committee include medical professional liability, liability insurance for physicians, medicolegal education, chemical tests for intoxication, forensic medicine, and medical testimony.

The University of Maryland Board of Regents has approved the appointment of **William J. Kinnard, Jr., PhD,** as dean of the School of Pharmacy, effective July 1.

Dr. Kinnard comes to Maryland from the University of Pittsburgh School of Pharmacy where he has been a member of the faculty since 1957, chairman of the curriculum committee since 1965, and full professor since 1966.

The February 26th issue of MODERN MEDICINE featured **A. McGehee Harvey, MD,** chairman of the department of medicine at The Johns Hopkins University, and physician-in-chief at The Johns Hopkins Hospital.

Dr. Harvey, selected by the journal editors as their "Contemporary" for the issue, has devoted a large part of his medical career to the question "How does man move?" His interests in this area, dating back to 1932, ultimately led to a quantitative technique for studying neuromuscular function in man, and "opened the door to meaningful studies of the pathogenesis of certain diseases," the journal states.

The Commonwealth Fund, a philanthropic foundation based in New York, has granted $270,000 to **The Johns Hopkins University School of Hygiene and Public Health** for the implementation of plans within its medical center to help establish studies of medical services and care as a major new phase of medical learning, comparable in significance to the best work being done in the biomedical and clinical sciences.

Responsibility for leadership in the University's decision to build up the health-studies field as a strong component of its objectives in medicine and health will be centered in the Department of Medical Care and Hospitals—recently established by the School of Hygiene and Public Health and headed by Dr. Kerr L. White, one of the country's foremost scholars and educators in the health disciplines.

Since joining The Hopkins in 1965, Dr. White has brought together a nucleus of able faculty representing the diverse range of disciplines involved in medical-care research; and this group provides the school with a solid starting base for expanding its work in the health field into a University-wide interest.

The Department of Medical Care and Hospitals will participate with faculty in the School of Medicine and in other parts of the university in experimental projects to explore and demonstrate improved medical-services systems, such as a comprehensive health-care program in the new city of Columbia. The main emphasis of the Department will be to strengthen the academic foundations on which such projects are based.

The Department has developed a four-part program directed toward this purpose. The Commonwealth Fund's grant provides support over an initial period of three years for added faculty, visiting scholars, and other costs of implementing the program.

An original oil painting of The Johns Hopkins University School of Medicine was presented to Thomas B. Turner, MD, dean of the school, by a representative of the E. R. Squibb & Sons, Inc. pharmaceutical firm on March 14. The painting, executed by Stuart Garrett, is part of a long-range plan by the firm to create a collection of original oils of the medical colleges of America. The project, known as "Collegia Medica," will be continued until representative paintings of all 86 medical schools have been completed.

The Heart Page

CHRIS PAPADOPOULOS, MD, EDITOR

A service of the Heart Association of Maryland

Risk Factors and Coronary Disease*

Current intensive efforts to provide therapy for persons who have already developed coronary heart disease will undoubtedly save lives. However, in view of the natural history of this disease, it appears likely that its morbidity and mortality can be substantially reduced through education and management aimed at preventing or retarding the development of atherosclerosis and its thrombotic complications. This can be said despite uncertainty concerning the exact role of many of the factors believed to contribute to the rate at which lesions develop in individual vessels. While the epidemiologic data correlating risk factors with incidence justify public recommendations based on these data, these recommendations undoubtedly will be more sharply defined according to the results of continuing investigation.

Preventive measures should be initiated early in life to have the best chance of preventing or retarding coronary heart disease. For example, correction of established adverse eating or smoking habits, while evidently beneficial, is certainly of less value than if the improper practices were never begun.

Guidelines for referral

Epidemiologic studies demonstrate that certain factors are associated with an increased rate of development of coronary heart disease. These factors include overt problems and personal attributes which may require modification and environmental factors which are correctable. In considering the several risk factors which contribute to the rate of development of atherosclerosis, it should be recognized that no single factor is absolutely etiologic—multiple causal factors play interrelated roles.

Overt Problems and Personal Attributes

Familial occurrence of coronary disease at an early age
Hypertension
Electrocardiographic abnormalities
Diabetes mellitus
Lipid abnormalities involving serum cholesterol and triglycerides and their lipoprotein vehicles
Obesity
Gout (hyperuricemia)
Certain personality-behavior patterns

Environmental Factors

Cigarette smoking
Lack of physical activity
Emotionally stressful situations

Some of these factors may directly or indirectly modify the rate of development of atherosclerosis, while others, such as severe emotional stress, may precipitate an acute cardiac event. Most are subject to change in what appears to be a favorable direction, although final proof of this is lacking (with the possible exception of cigarette smoking). Additional research to provide more effective prevention is urgently needed, but enough information is at hand to advocate that individuals who are highly susceptible to coronary disease be placed on regimens designed to correct their unfavorable characteristics. This is particularly true when the early development of coronary disease is a family characteristic. It is well recognized that a strong family history of coronary disease may be due to a tendency to atherosclerosis, to hyperlipidemia, to diabetes, or to essential hypertension as the basic disorder. Many individuals, if forewarned of their susceptibility to heart disease, may be willing to follow a regimen to reduce their risks.

**From a statement Released by the Central Committee for Medical and Community Program of the American Heart Association, December 8, 1967.*

Early detection of susceptible individuals involves some form of routine surveillance for the appearance of risk factors. Most people today receive health examinations for a variety of reasons including insurance or school health examinations, periodic health checkups, and pre-employment physicals. Inclusion of certain procedures for identifying the "coronary prone" is one important approach. For such examinations to be effective, the persons with abnormalities must be referred to a physician, and the physician must be able to institute corrective measures.

It is recommended that individuals with a two-fold or more increase in risk be referred to physicians for prophylactic management. The "coronary-prone" adult with at least this level of elevated risk demonstrates one or more of the following:

1. Serum cholesterol of more than 260 mg%, a fasting triglyceride of more than 250 mg%, or a prominent electrophoretic pre-beta lipoprotein band
2. Sustained blood pressure over 160/95 mm Hg
3. Body weights 30% or more above standards listed in tables of desirable weight.*
4. Fasting blood sugar of more than 120 mg%, or a casual blood sugar of 180 mg%, decreased glucose tolerance or significant glycosuria
5. History of gout or a uric acid level over 7.5 mg%
6. Electrocardiographic abnormalities**
7. Habitual cigarette smoking

The designation of "abnormal" levels for certain of these risk factors is arbitrary. For example, risk has been demonstrated to increase from the lowest to the highest level of blood pressure and cholesterol recorded in the population.

As single abnormalities, each of these items carries at least a two-fold excess risk of coronary disease. Lesser abnormalities than the values listed may be important when two or more factors are present. Individuals with multiple abnormalities demonstrate up to a ten-fold excess risk of coronary disease. Sedentary individuals appear to be especially prone to lethal coronary attacks. The appearance of new electrocardiographic abnormalities may indicate the development of early asymptomatic coronary disease.

General Recommendations for the Physician

When patients present themselves for periodic examinations or for other reasons, identification of the factors which enhance the risk of coronary heart disease should be included in the examination. These factors should be looked for in young adults, as well as in older individuals, to permit the earliest possible identification of susceptible individuals. Once identified, long-term supervision and periodic re-examination of the coronary-prone individual are of paramount importance in establishing effective and sustained control of the factors which enhance risk. It is important that physicians develop a greater interest in the prevention of atherosclerosis rather than confine their concern principally to the treatment of patients with symptomatic coronary disease.

The preventive approach to atherosclerosis is particularly important in the care of children from families demonstrating metabolic abnormalities including the hyperlipidemias, obesity, hypertension, diabetes, gout, and early coronary disease. Preventive measures applied to these individuals early in life should be even more fruitful than those applied only after the development of overt disease.

Long-term management by the physician should include repeated evaluation of both the cardiovascular system and the several coronary risk factors. This entails periodic determination of body weight, blood pressure, blood lipids, uric acid levels, blood glucose, and ECG. A simple total vital capacity and chest X-ray for heart size are also helpful. These examinations are also required to evaluate the effect of the measures instituted to control the risk factors. Unrecognized or silent myocardial infarctions are neither rare nor innocuous and may be detected only by periodic electrocardiographic examination. Annual examinations should, therefore, be encouraged particularly in subjects exhibiting these risk factors and especially in subjects over forty years of age.

---

*Metropolitan Life Insurance Co. *Statistical Bulletin*, November-December, 1959.

**These include left ventricular hypertrophy, intraventricular block, distinctly abnormal S-T segment displacement and T-wave abnormalities at rest, atrial fibrillation otherwise unexplained, myocardial infarctions, and unequivocal ischemic post-exercise S-T and T-wave abnormalities.

TUBERCULOSIS

A Service of the Maryland Tuberculosis Association

The Hazard Is Relative

Should Patients with tuberculosis be cared for in general hospitals and, if so, what precautions should be taken?

Richard L. Riley, MD

With tuberculosis sanatoria closing there is no place left for tuberculous patients who need hospitalization other than general hospitals, so the first half of this question is almost irrelevant. In regard to the second half, the May issue of the Journal will contain a statement from the Ad Hoc Committee on Treatment of Tuberculosis Patients in General Hospitals of the National Tuberculosis Association. This statement, entitled "Infectiousness of Tuberculosis,"* tells what precautions should be taken and why. I shall amplify the Committee's statement by showing how the hazard of catching tuberculosis varies in different environments and why the Committee's recommendations are appropriate for the environment of the general hospital.

Inasmuch as a single tubercle bacillus implanted on the lung tissue of a tuberculin-negative person is all that is required to infect, the hazard of infection depends upon the likelihood that such implantation will take place. This in turn depends upon the likelihood that an airborne tubercle bacillus will be inhaled, which is related to the concentration of airborne tubercle bacilli in enclosed atmospheres, and hence upon the balance between the rate at which organisms are added to the air and the rate at which they are removed. The rate of addition depends upon the character of the pulmonary lesions and the behavior of the patient, whereas the rate of removal depends upon disinfection of the air either by killing the organisms or venting them to the outdoors. To control the rate of addition one must control the patient; control of the rate of removal involves control of the aerial environment.

In the concluding paragraph of the Committee's report it is stated "that the greatest risk of infection arises from the subject with undiagnosed or unsuspected tuberculosis." Clearly one has no control over an undiagnosed and unsuspected case. By exclusion, therefore, one must approach this particular hazard by increasing the rate of removal of airborne organisms from enclosed atmospheres that people might unwittingly share with such a person. Under ordinary conditions, whether in hospital, at work, or in the community, one must place primary reliance upon air disinfection in order to avoid inhaling a tubercle bacillus. This approach, like BCG vaccination, is aimed at reducing the risk of infection from the subject with unsuspected tuberculosis.

Reprinted from THE AMERICAN REVIEW OF RESPIRATORY DISEASE, Volume 96, Number 4, October 1967.

Whether an enclosed atmosphere is safe or dangerous when shared with a person with unsuspected tuberculosis depends on the rate at which organisms are removed. A modern naval vessel, in which all the air is recirculated, provides an example of minimal removal of airborne organisms. As a consequence there have been, according to Houk and associates, six outbreaks of tuberculosis aboard ships of the U. S. Navy during the past few years.[1] One of the sharpest occurred in 1966 and was intensively studied.[2] Approximately 50% of 308 enlisted personnel at risk demonstrated new infection with *Mycobacterium tuberculosis*. Of the 66 subjects, who shared a sleeping compartment with the first person with unsuspected tuberculosis, over 80% became infected. A ship like this, in which people are crowded together and breathe the same recirculated air, can, with luck, operate for years without tuberculosis, if there is nobody with tuberculosis aboard. However, the "infectious potential" is always present, and the accidental occurrence of an unsuspected case can lead to a devastating outbreak. In such a human exposure chamber the average time required to implant a tubercle bacillus in the lung can be reckoned in days or weeks, if a tuberculosis disseminator is aboard.

Before the advent of chemotherapy, the air of Bellevue Hospital in New York was somewhat hazardous to breathe. On the tuberculosis service it was not uncommon to have two six-bed rooms occupied by recently infected doctors and nurses. The hazard appeared to be more or less the same throughout the hospital and was not unique to the tuberculosis wards. Presumably the unsuspected cases on the other wards were as dangerous as the known cases on the tuberculosis wards. Between the years 1930 and 1948, the average time for "conversion" of the tuberculin test in student nurses with previously negative reactions was about 1.5 years.[3] Hence it took perhaps ten times as long to get infected at Bellevue as it did the sailors referred to. The ventilation at Bellevue was better, and the nurses breathed Bellevue air only at work, whereas the sailors breathed their contaminated atmosphere 24 hours a day.

In the Veterans Administration hospitals the rate of "conversion" of the tuberculin test in hospital personnel was running at 2.3 for the year 1963.[4] At this rate the average time required for infection would be about 43 years, or almost 30 times what it used to be at Bellevue and hundreds of times what it was during the outbreak aboard ship. The reasons for this magnificent advance include the following: Almost all hospitalized patients are noninfectious as a result of chemotherapy; in Veterans Administration hospitals there is little likelihood of exposure to unsuspected and, therefore, untreated patients; and in V. A. hospitals ventilation per person is relatively good. The V. A. has reduced the hazard of tuberculosis to acceptable proportions by controlling both the patient and the environment.

If the Veterans Administration can take care of large numbers of tuberculous patients without significant hazard to hospital personnel, general hospitals should be able to care for an occasional patient without undue hazard. There is no reason to doubt that chemotherapy can work its magic equally well in general hospitals. It seems likely, however, that opportunities for exposure to unsuspected and untreated patients are greater in general hospitals, and that ventilation per person is less, particularly in crowded outpatient clinics and emergency wards. With this in mind the NTA Committee recommends that "ultraviolet lights be used in rooms that are likely to be frequented or occupied by patients with undiagnosed or unsuspected tuberculosis," and also in rooms occupied by "tuberculous patients in the early phase of chemotherapy." And with an eye to the day when hospital air conditioning might be modeled after naval vessels, the Committee also recommends ultraviolet lights "in air ducts when air is being recirculated."

It can be anticipated that general hospitals, which comply with the Committee's recommendations, can accept tuberculous patients and at the same time reduce the hazard to personnel to the level that currently exists in Veterans Administration hospitals. If, on the average, the chance of implanting a tubercle bacillus is lowered to once in 43 years, most people would agree that the hazard is acceptable. This does not mean that the tubercle bacillus has lost its sting, but rather that the air surrounding a person with tuberculosis can now be made relatively safe.

Alcoholism Section

ATTITUDES AND ALCOHOLICS

ISADORE TUERK, MD
Commissioner, Maryland Department of Mental Hygiene*

In my 20 years of rich and rewarding experience in treating alcoholics and in training other professional personnel to treat them, I have become increasingly certain that the key to effective treatment of these sick people is a positive, accepting attitude toward them, based on a genuine conviction that alcoholism is indeed a disease.

The alcoholic usually comes for treatment dragging a heavy old burden of guilt, shame, and humiliation. He is, after all, a member of his society and is likely to share its general view of the alcoholic as weak and worthless. He expects the therapist to judge him as harshly as he judges himself, to blame him as bitterly as he blames himself for his behavior and its destructive effect on his family. He comes qualified as an expert on his own badness!

If, in the initial contact, the therapist reflects back to him any part of his own feelings, there can be little hope of progress toward recovery: the alcoholic's hopelessness is confirmed. If, on the other hand, the therapist, while accepting the reality of his patient's feelings, projects a very different reality in his interpretation of the disease concept of alcoholism, the alcoholic can let himself begin to hope: for disease there may be treatment and the goal of treatment is recovery.

In the course of treatment, the alcoholic will test the therapist's attitude vigorously and repeatedly. If any doubt, any confusion contaminates the therapist's professional diagnostic approach, the alcoholic will seek it out and turn it against himself. His skepticism and ambivalence about the diagnosis and treatment and the hope they represent may literally "drive him to drink," and each new drinking episode provides another test of the therapist's good faith.

Unfortunately, many professional people cannot "pass" the alcoholic's tests. They may have had no training or experience in treating alcoholics, or they may have unresolved problems about their own drinking patterns or the drinking pattern of someone they love which cripple their relationships with such patients. Consider the following examples:

The professional nurse who disapproves of admitting alcoholics to her hospital because, "there are so many really sick people who need our beds."

The social worker who greets an alcoholic on his fourth visit to a specialized in-service facility with the involuntary groan, "Oh, no, not you again!"

The physician in a tuberculosis hospital who is reluctant to diagnose his patient's alcoholism because the diagnosis is "unkind" to the patient.

All three of these well-trained and dedicated individuals would quite honestly agree with me that alcoholism is a disease. They think they believe it. But if alcoholism is a disease, are

**With the editorial assistance of Mrs. Gertrude L. Nilsson, Coordinator of Services to Alcoholics, Maryland Department of Mental Hygiene.*

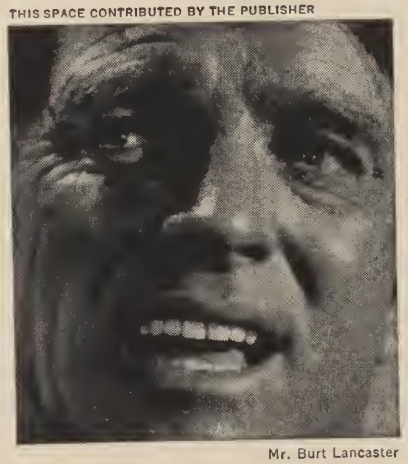
(Reprinted from Labor Rehabilitation Report, *with the permission of the publisher, National Institutes on Rehabilitation and Health Services.)*

patients with other diagnoses really more sick than alcoholics? And if alcoholism is a disease, is it reprehensible that the alcoholic seeks in-patient treatment for its acute symptoms? And if alcoholism is a disease, is its diagnosis unkinder than that of tuberculosis, or diabetes, or any other disease? The answer to each of the above questions is, of course, no. The reason for asking the questions is that the well-meaning professional people I have quoted believed only superficially that alcoholism is a disease. In each case, the belief was shadowed by lingering, deep-seated suspicions that the alcoholic drinks too much voluntarily, in order to have a good time, because he wants to; or that he gets drunk because he is weak-willed or not "man enough to hold his liquor." In each case, the professional attitude is distorted by prejudice against the alcoholic patient, to which he is only too acutely sensitive.

It might be helpful to try to describe, however unscientifically, the elements that combine to create the positive accepting attitude I believe is essential to effective treatment of alcoholics.

The first has already been noted: genuine conviction that alcoholism is a disease. Such conviction gains in strength and stability with increasing knowledge about alcoholism and increasing treatment experience with alcoholics.

The second has been implied: resolution of the therapist's personal problems with drinking and drunkenness to the point that he can be as objective with an alcoholic patient as with a cardiac patient.



A third is humility. Although we know some things about alcoholism and some things about treating alcoholics, there are still many unanswered questions about causation, treatment, etiology, etc. The therapist must be ready not only to acknowledge what is not known or what he himself does not know, but must also be ready to learn from his patient—from what he does not say, as well as from what he does say about his alcoholic career.

A fourth is the capacity to sense beneath the often unpleasant surface of the acutely intoxicated alcoholic or the bland, ingratiating surface of the sober alcoholic, the cry for help of a desperately sick individual, complicated by self-defeating resistances to seeking and using such help.

A fifth is a high level of resistance to frustration and the willingness to keep treating in spite of what is too often condemned as "poor motivation" on the part of the patient. Treatment people in the alcoholism field must learn to be satisfied with partial goals, and to expect, and even make therapeutic use of, acute manifestations of the disease. They must question their own motivation to treat before they question the alcoholic's motivation to accept treatment.

And, finally, a sixth is willingness to share the treatment of an alcoholic with other agents and agencies: a member of Alcoholics Anonymous, a pastoral counselor, a family physician, or anyone else who might have some impact on the patient which would effectively complement the therapist's impact.

Baltimore City Health Department

Robert E. Farber, MD, MPH, Commissioner

Health Aide Training Program

An important step toward providing nonprofessional health aides for the community has been taken by the City Health Department in inaugurating a Health Aide Training Program for unemployed or underemployed inner-city residents.

Funded for a six-month period by the Manpower Development Training Act through the Baltimore Community Action Agency's Concentrated Employment Program, the project has been made possible by a contractual arrangement of the Maryland State Department of Education, the Baltimore City Department of Education and the Baltimore City Health Department. Supportive activities will be provided by the Maryland State Employment Service.

Beginning with 25 trainees, the program will provide ten weeks of intensive class and field work that will qualify the participants for a variety of health aide positions in health agencies, hospitals, nursing homes and other similar activities. Health aides will serve in such posts as nursing or medical assistants, sanitarian aides, community aides, interviewers or receptionists.

Established through the efforts of Matthew Tayback, ScD, Deputy Commissioner of Health the new Health Aide Training Program is directed by Mr. William G. Sykes, MSW, ACSW, Chief Social Worker Consultant in the City Health Department's Child Health Services Project 606. Mrs. Nancy McAndrew, a nurse with two years' experience in teaching practical nursing, has been employed as training supervisor and instructor.

Subject areas for the ten-week course include orientation and medical terminology; health problems of Baltimore with emphasis on the inner city; health agency structure and function; fundamentals of anatomy, physiology and hygiene; basic nursing techniques and patient care; community and personal relations; and career opportunities. Class, field and clinical work will be arranged through the assistance of cooperating community agencies which, hopefully, will provide future employment for the graduates.

Headquarters for the new training program is the Southern Health District Building, 1211 Wall Street. Liaison with the Department of Education will be maintained through Mr. Joseph Zebley, Jr., Associate, Manpower Development and Training, Adult Education Program of the City Department of Education.

Queries regarding placement of Health Aides who have completed the course of training may be directed to Mr. William G. Sykes, Telephone 752-2000, Extension 2778.

Alcoholism Counselors

The City Health Department's first group of eleven alcoholism counselor trainees completed their six-month training program on March 22.

Certificates of satisfactory completion of the program which qualifies the participants for posts as alcoholism counselors were awarded to the following trainees, most of whom have already been placed in community agencies: Mary Louise Bianco, William E. Black, Richard C. Cain, Gabelle Fisher, Melvin Gill, Henry R. Hall, Judith A. Harris, Clarence W. Hurley, Jr., Paul B. Kluge, John G. Stockman, and Frances Tisdale.

The City Health Department training program for alcoholism counselors is funded through a three-year educational grant by the National Institute of Mental Health. Approximately 20 trainee stipends, several of which have been made possible by local industry and agencies, will be available for the second group which commences in April.

The alcoholism counselor program is aimed at meeting the need for semiprofessional persons who can assist and guide the growing number of victims of alcoholism to overcome their illness so they can again take their place in the community as productive citizens.

The new alcoholism counselor training project is under the direction of Abraham M. Schneidmuhl, MD, Director of the City Health Department's Alcoholism Center, 2221 St. Paul Street. Co-director in charge of education and training is Mrs. Gladys Leigh Augustus, a vice principal now on leave of absence from the City Department of Education.

Physicians are invited to call the Alcoholism Center if they require assistance with any problem dealing with the alcoholic. The telephone number is 752-2000, Extension 2756.

Woman's Auxiliary

MRS. HARRY L. BERMAN, EDITOR

THE WOMAN'S AUXILIARY TO THE STUDENT AMERICAN MEDICAL ASSOCIATION

The University of Maryland Chapter of the Woman's Auxiliary to the Student American Medical Association (WA-SAMA) is an active group of medical students' wives with enough spark to generate its activities with sweep and speed. The National Auxiliary was formed in Philadelphia, Pennsylvania in May, 1957, by representatives of the University of Maryland and 27 other medical schools. There are now 67 chapters with a total membership of 5,000.

Communication between the campuses is maintained through regional and national meetings, with local attendance made possible through the financial support given by the State, Baltimore City and Baltimore County Auxiliaries. Circulation of the National news-letter, CHATTERBOX, the Region III (Maryland, District of Columbia, West Virginia, and Pennsylvania) PRESCRIPTION PAD, and the University of Maryland NEWS-LETTER keeps the members informed of the activities of other groups.

At the beginning of each school year, a "Welcoming Tea" given at the home of a member of the Woman's Auxiliary to the Baltimore City Medical Society, honors the wives of the freshmen medical students and the summer brides of the upper classmen and acquaints them with the programs and projects of WA-SAMA. Of particular interest this year were physician speakers whose subject was "IS YOUR HUSBAND OUTGROWING YOU?", and the presentation by Joseph H. Hooper, Jr., MD on pertinent medical legislation. A mixture of fun things such as holiday parties, dances and hayrides are sprinkled throughout the year and culminated with an annual May luncheon honoring the wives of the senior students.

THE WOMAN'S AUXILIARY TO THE CARROLL COUNTY MEDICAL SOCIETY

The Woman's Auxiliary to the Carroll County Medical Society, Mrs. Charles Mawhinney, Jr., President, augmented the funds for its nursing scholarship program through a highly successful bake sale.

An outstanding community service of the Auxiliary was the creation of a "Bedside Library" for the patients in Carroll County Hospital, in honor of the county physicians. The generous gift of 150 volumes by Random House Publishing Company added to those donated by the Auxiliary create an adequate library for the patients.

Carroll County Auxilians are saddened by the death of one of their most active and outstanding members, Mrs. Lewis K. Woodward, wife of Lewis K. Woodward, MD and mother of Theodore E. Woodward, MD.

Paul F. Guerin, MD, Chairman
Library and History Committee

Elizabeth Sanford
Librarian

NEW CHAIRMAN ASSUMES DUTIES

Paul F. Guerin, MD, assumed the chairmanship of the Library and History Committee in November, 1967, following the resignation of Louis Krause, MD, from that position.

Dr. Guerin was born in Wesleyville, Pennsylvania. Following his graduation from high school in Wesleyville, he attended Wittenberg University in Springfield, Ohio, where he received an AB degree in 1942. He was awarded an MD degree from the University of Pennsylvania in 1945, and interned at the University of Chicago Clinics from 1945 to 1946. The Medical Corps of the United States Army claimed his services from 1946 to 1948, and from 1948 to 1950 he served his residency at Temple University Hospital in Philadelphia, after which he returned to the Medical Corps and was stationed in Maryland and Hawaii. In 1954 he settled in Maryland.

—Mitchell

Dr. Guerin

A former Assistant Medical Examiner for Maryland, Dr. Guerin is Director of Laboratories at Franklin Square Hospital, Baltimore. He is affiliated with Maryland General Hospital, South Baltimore General Hospital and North Charles General Hospital. He is Assistant Professor of Pathology at the University of Maryland School of Medicine. Since 1961, Dr. Guerin has been associated with Watson Kime, MD, and Edward L. Sherrer, MD, in the practice of laboratory pathology in addition to his private office schedule.

Dr. Guerin has been active in the Medical and Chirurgical Faculty and has served as past chairman, Economics Committee; chairman, Med-Chi Insurance Trust; Liaison Committee member; and a member of the Executive Committee, MMPAC. Also, he is active in a long list of professional organizations and offices, both local and national.

He is married to the former Phyllis Bacher and is the father of three sons—Richard, a junior at the Johns Hopkins University; Joel, an Oberlin College sophomore; and Michael, a senior at McDonogh.

Dr. Guerin is a member of the Mt. Washington Club, the Maryland Yacht Club, and is listed as a junior navigator with the US Power Squadron.

Serving on the Library and History Committee under the guidance of the chairman are Robert B. Goldstein, MD, Baltimore; Thomas C. Hill, MD, Salisbury; Katherine A. Chapman, MD, Kensington; Louis Krause, MD, Baltimore; and H. Baldwin Streett, DDS, Baltimore.

CANTIL®

(mepenzolate bromide)

Diarrhea and other symptoms of common G.I. disorders can often be curbed with Cantil (mepenzolate bromide), bringing welcome relief to the harassed patient. Relatively specific for the hyperactive colon, it helps reduce diarrhea, pain and spasm with minimal effect on other viscera. Cantil (mepenzolate bromide) is indicated whenever these symptoms are associated with irritable colon, gastroenteritis, diverticulitis, and mild to moderate ulcerative colitis.

It is an anticholinergic drug without narcotic properties. Side effects are usually mild.

LAKESIDE

CONTRAINDICATIONS: Sensitivity to Cantil® (mepenzolate bromide), glaucoma, G.I. or G.U. obstruction, toxic megacolon. WARNINGS: Possibility of adverse reactions in advanced severe ulcerative colitis and atypical agitated reactions to phenobarbital in the elderly (Cantil with Phenobarbital). PRECAUTIONS: Cantil is of adjunctive use only; treatment of the underlying condition is indicated, be it organic or functional. Observe caution in conditions known to be incompatible with atropine-like drugs, e.g., open-angle glaucoma or prostatic hypertrophy. ADVERSE EFFECTS: Dry mouth; blurred vision; constipation; nausea; vomiting; bloating; dizziness; urinary retention. All are anticholinergic effects and usually tolerable. Habituation and idiosyncratic reactions to phenobarbital (Cantil with Phenobarbital) are possible, as is generalized rash. DOSAGE: One or two tablets three times a day and one or two at bedtime usually provide prompt relief. Cantil with Phenobarbital may be prescribed if sedation is required. HOW SUPPLIED: CANTIL (mepenzolate bromide)—25 mg. per scored tablet. Bottles of 100 and 250. CANTIL with PHENOBARBITAL—containing in each scored tablet 16 mg. phenobarbital (warning: may be habit forming) and 25 mg. mepenzolate bromide. Bottles of 100 and 250.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

Let's be specific about Campbell's Soups... and *reducing diets*

There are more than 30 million people in America who are overweight. During the next year, you probably will see more than 1,000 of them in your own practice.

One good way to help these patients is to give them a reducing diet based on ordinary eating patterns.

Campbell has prepared a sensible plan for weight control based on ordinary eating patterns. The plan consists of a patient instruction booklet and a set of menus which provide approximately 1,200 calories daily. The menus are balanced to provide the minimum daily requirements of nutrients.

To obtain a supply for your office write to:
Campbell Soup Company, Box 265, Camden, N. J. 08101

Conventional Radiography

The restless duodenum makes radiographic diagnosis difficult, uncertain and often unproductive: Is this duodenum abnormal?

Hypotonic Duodenography

Pro-Banthine-induced duodenal calm permits full anatomic appraisal: Same patient. Duodenal normality is now evident.

- **in diagnosis**
- **in treatment**

Pro-Banthine® brand of propantheline bromide

calms the gastrointestinal tract

For fifteen years Pro-Banthine has been the most widely used anticholinergic agent in disorders of gastrointestinal motility and gastric hypersecretion. More recently Pro-Banthine has reestablished its pharmacologic effectiveness in diagnostic procedures using intragastric fibroscopy and hypotonic roentgenography.

How the X-rays were taken

In the hypotonic duodenograph[1,2] reproduced above, the gastrointestinal tract was relaxed with Pro-Banthine. The duodenum was intubated. Pro-Banthine in a dose of 60 mg. intramuscularly was used to assure prompt aperistalsis and double-contrast visualization was achieved with ordinary barium and air.

The same pharmacologic efficiency has proved of pronounced value in such conditions as: *peptic ulcer, pylorospasm, biliary dyskinesia, functional hypermotility and irritable colon.*

Contraindications: Glaucoma or severe cardiac disease.

Precautions: Since varying degrees of urinary hesitancy may occur in elderly males with prostatic hypertrophy, this should be watched for in such patients until they have gained some experience with the drug. Although never reported, theoretically a curare-like action may occur with possible loss of voluntary muscle control. Such patients should receive prompt and continuing artificial respiration until the drug effect has been exhausted.

Side Effects: The more common side effects, in order of incidence, are xerostomia, mydriasis, hesitancy of urination and gastric fullness.

Dosage: The maximal tolerated dosage is usually the most effective. For most *adult* patients this will be four to six 15-mg. tablets daily in divided doses. In severe conditions as many as two tablets four to six times daily may be required. Pro-Banthine (brand of propantheline bromide) is supplied as tablets of 15 mg., as prolonged-acting tablets of 30 mg. and, for parenteral use, as serum-type vials of 30 mg. The parenteral dose should be adjusted to the patient's requirement and may be up to 30 mg. or more every six hours, intramuscularly or intravenously.

SEARLE

Research in the Service of Medicine

Help clear up that miserable stuffed-up feeling with Dimetapp. Each hard-working Extentab brings welcome relief from the stuffiness, drip and congestion of upper respiratory conditions for up to 10-12 hours. Yet, patients seldom experience drowsiness or overstimulation. The key to success is the Dimetapp formula: Dimetane (brompheniramine maleate)—along with phenylephrine and phenylpropanolamine, two time-tested decongestants. They get the job done... in a hurry.

Indications: Dimetapp is indicated for symptomatic relief of the allergic manifestations of respiratory illnesses, such as the common cold and bronchial asthma, seasonal allergies, sinusitis, rhinitis, conjunctivitis, and otitis.
Contraindications: Hypersensitivity to antihistamines. Not recommended for use during pregnancy.
Precautions: Until patient's response has been determined, he should be cautioned against engaging in operations requiring alertness. Administer with care to patients with cardiac or peripheral vascular diseases or hypertension.
Side Effects: Hypersensitivity reactions including skin rashes, urticaria, hypotension and thrombocytopenia, have been reported on rare occasions. Drowsiness, lassitude, nausea, giddiness, dryness of the mouth, mydriasis, increased irritability or excitement may be encountered.
Dosage: 1 Extentab morning and evening.
Supplied: Bottles of 100 and 500.

in sinusitis, colds, U.R.I.
Dimetapp® Extentabs®
(Dimetane® [brompheniramine maleate], 12 mg.; phenylephrine HCl, 15 mg.; phenylpropanolamine HCl, 15 mg.)
up to 10-12 hours clear breathing on one tablet

When the emotionally impaired patient pays an office call...

he asks for your help, ut just can't seem o follow through n your advice.

When not at your office, she's constantly on the phone: can't sleep, headache, G.I. upset.

She often seeks a physical explanation for her distressing emotional state.

She's excessively apprehensive; demands much more of your nurse's attention.

moderate to severe anxiety...

Mellaril helps control the most frequent symptoms: marked nsion, agitation, apprehension, restlessness, hypermotility Mellaril often alleviates anxiety-induced somatic complaints Mellaril frequently helps strengthen emotional resources Mellaril helps the patient maintain alistic contact with environment, closer armony with family

ontraindications: Severely depressed or omatose states from any cause, and in ssociation with or following MAO inhibi- rs; severe hypertensive or hypotensive eart disease.

recautions: Hypersensitivity reactions e.g., leukopenia, agranulocytosis) and nvulsive seizures are infrequent. Pig- ientary retinopathy has been observed here doses in excess of those recom- ended were used for long periods of time. May potentiate central nervous system depressants, atropine, and phosphorus insecticides. Where complete mental alertness is required, administer the drug cautiously and increase dosage gradually. In addition, orthostatic hypotension (especially in female patients) has been observed. Epinephrine should be avoided in treatment of drug-induced hypotension.

Side Effects: Pseudoparkinsonism and other extrapyramidal disorders are infrequent; drowsiness, especially in high doses early in treatment, may occur; nocturnal confusion, dryness of the mouth, nasal stuffiness, headache, peripheral edema, lactation, galactorrhea, and inhibition of ejaculation are noted on occasion; photosensitivity and other allergic skin reactions may occur but are extremely rare.

for moderate to severe anxiety

Mylanta®

aluminum and magnesium hydroxide *plus* simethicone

a solution to peptic ulcer distress

Effective neutralization—
with the two most widely prescribed antacids: aluminum and magnesium hydroxides.

Concomitant relief of G.I. gas distress—
with the proven[1] defoaming action of simethicone.

Prolonged acceptance confirmed—
in 87.5% of 104 patients after a total of 20,459 documented days of therapy.[2]

Composition: Each Mylanta chewable tablet or teaspoonful (5 ml.) contains: magnesium hydroxide, 200 mg.; aluminum hydroxide, dried gel, 200 mg.; simethicone, 20 mg.
Dosage: One or two tablets (well chewed or allowed to dissolve in the mouth) or one or two teaspoonfuls to be taken between meals and at bedtime.

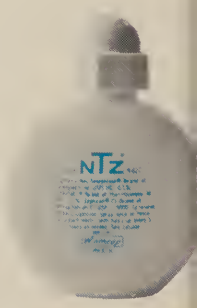
"The inconvenience of a cold"

For a cold, NTz® Nasal Spray provides rapid relief of nasal symptoms. Relief starts with the first spray which opens the inferior part of the common meatus. A second spray, a few minutes later, will shrink the turbinates to help provide sinus drainage and ventilation. Dosage may be repeated every three or four hours as needed, for temporary relief of symptoms. NTz is well tolerated but overdosage should be avoided.

As a sinusitis deterrent, NTz Nasal Spray can be used to keep the nasal passages open during a cold to help prevent development of acute sinusitis—or to help prevent the acute condition from becoming chronic.



Supplied: NTz Nasal Spray, plastic squeeze bottles of 20 ml.; NTz Nasal Solution, bottles of 30 ml. (1 fl. oz.) with dropper.

NTz is more than a simple vasoconstrictor. It contains

Neo-Synephrine® (brand of phenylephrine) HCl 0.5 per cent, the major component, virtually synonymous with fast, efficient but gentle nasal vasoconstriction.

Thenfadil® (brand of thenyldiamine) HCl 0.1 per cent, topical antihistamine for reduction of rhinorrhea, sneezing or itching. It combats the allergic reactions that may occur in colds or sinusitis.

Zephiran® (brand of benzalkonium, as chloride, refined) 1:5000, antiseptic preservative and wetting agent to promote penetration and spread of the formula.

Seminar on Quality Control in Clinical Chemistry

To insure reliable laboratory results in clinical chemical tests, the Biochemistry Division of the Bureau of Laboratories maintains routinely an internal quality control program including continued examination of known standards. In addition this Division participates in the proficiency testing conducted as part of the "National Laboratory Improvement Program" by the Medical Laboratory Section, National Communicable Disease Center, Atlanta, Georgia. To assist the private and hospital clinical laboratories in Maryland to maintain a continuously high level of performance, a two-day seminar will be held in May, on *Quality Control in Clinical Chemistry.*

Highlights

Laboratory Diagnosis of Cytomegalovirus Infection

The Virology Division of the Bureau of Laboratories now offers a new virus diagnostic service, i.e., the isolation and serologic testing of cytomegalovirus, the agent of cytomegalic inclusion disease (CID). The disease occurs primarily in the newborn. Generalized infection in the fetus during gestation will result in mental retardation, microcephaly, cerebral calcifications or, in some cases, death soon after birth.

It is possible to diagnose cytomegalovirus infection by serological examinations of blood from newborn infants. The virus can be isolated by human tissue-cell cultures of clinical material from these infants. Ten to fifteen days are required to perform the serologic test on serum, and at least one month to isolate culturally and finally identify the cytomegalovirus.

Research at some centers in the United States is being directed at identification, in tissue taken from the scalp of the fetus, of the "heavy" Immune globulins M, which do not pass out of the placental barrier.

Physicians Asked to Assist in Drug Economy

A list of some commonly prescribed brand name drugs and their generic equivalents, together with comparative wholesale prices, was recently sent to all physicians. The covering letter suggested that physicians consider prescribing the less expensive drugs when clinical efficacy is believed comparable to advertised brands. Pharmacists were also asked to cooperate in the effort to economize on this phase of the Medical Assistance Program.

Payment for Special Services in Nursing Homes Curtailed

Payment for physical therapy, speech therapy and podiatry services to Medical Assistance patients in nursing homes after February 1, 1968, has been eliminated, an action necessitated by the total depletion of budgeted funds. Some nursing homes offer these services as part of institutional care, and in some counties, services are provided through local health departments. The facilities of the Chronic Disease and Rehabilitation hospitals are available in cases where there is real promise of rehabilitation.

Lab Training in Medical Mycology

A recent workshop in identification of medically significant fungous organisms (medical mycology) was held by the Bureau of Laboratories, in conjunction with faculty specialists from the National Communicable Disease Center, Atlanta. This specialty course was given only to laboratory workers in Maryland who are actually engaged in medical mycology laboratory work.

VD Workshop for Public Health Nurses

The Divisions of Communicable Diseases, Nursing, and Health Education recently conducted a venereal disease workshop for public health nurses in Baltimore. The objectives were to provide current information on the status of venereal diseases and to establish guidelines for cooperation between nurses, venereal disease investigaters and health department clinicians. Enrollment was limited to a maximum of three nurses from each county.

REPORT OF THE AD HOC COMMITTEE FOR THE STUDY OF PKU LEGISLATION

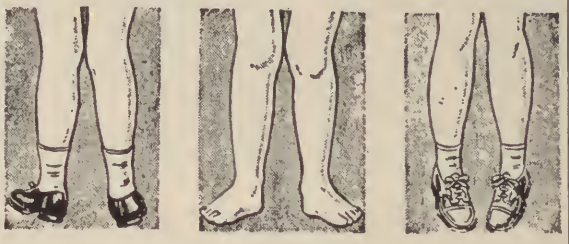
I. *Purpose*—To study and make recommendations concerning the advisability of amending or repealing the existing PKU law.

II. *Approach*—A. Four meetings were held with persons deemed knowledgeable with the problem:

(1) Dr. Benjamin D. White, Director, Bureau of Preventive Medical Services

(2) Mr. Harry Penn, Administrator, Prince George's County General Hospital

(3) Dr. Samuel P. Bessman, Professor of Pediatrics, University of Maryland



(4) Mr. Morris Scherr, Maryland Association for Retarded Children

B. A letter to administrators of general hospitals in Maryland requesting information as to whether any problems have arisen as a result of the law.

C. Requested an interpretation from the office of the Attorney General of the legal responsibility of the hospital in the event of follow-up failure.

III. *Results*—Dr. White provided the Committee with a history of PKU testing in Maryland. Originally, it began as a pilot program; statewide voluntary screening was approved by the Academy of General Practice, Academy of Pediatrics, Ob-Gyn Society, Maryland Pediatric Association, and Maryland Hospital Council. The Medical and Chirurgical Faculty did not take a stand and approved only that portion pertaining to an educational program for the public and physicians. Mr. Harry Penn felt that the real problem is not the testing but the placing of the legal responsibility on the hospital administrator. Although the hospital now bears the responsibility, it does not have the authority to enforce a follow-up. Dr. Samuel Bessman felt the PKU law is premature. Although he feels testing should be done, it should be voluntary. He questioned the efficacy of therapy and felt that mandatory testing (and subsequent mandatory treatment) was stultifying to research at this time. He believes strongly that PKU legislation should be repealed. Mr. Morris Scherr stated his association initiated legislation because no stand was taken by Med-Chi and proceedings also served to stir up interest in the legislature concerning mental retardation. The Maryland Association for Retarded Children Board of Directors is firmly committed to the law as it is at present. The Association would give consideration to repeal if it were proven that a hardship on persons or groups resulted, and that funds were unnecessarily expended. If continued on a voluntary basis, they would want assurance

that the program continue as presently operated.

There are 45 general hospitals in Maryland. Of these, 14 responded to our inquiry. In general, the hospitals report that they are not experiencing hardship in implementing the law. The Baltimore City Health Department experienced a drop in the number of cases referred by hospitals for follow-up after the amendment of June 1, 1967. The amendment spells out what the hospital should do if the child leaves the hospital before a satisfactory test has been performed: i.e., the institution shall notify the parents of the infant in writing advising them to have the test performed by the private physician or local health department.

An inquiry was sent to the office of the Attorney General requesting an interpretation in those instances where contact of the parents was unsuccessful. The response by Mr. Louis E. Schmidt, Special Assistant Attorney to the Maryland State Health Department, is quoted in part—"There can be no doubt that the institution 'shall cause' to have administered the PKU test or determine that a 'satisfactory test' has been performed . . . The use of the word 'shall' in the statute indicates that the statutory provisions are mandatory and not discretionary. Therefore, no discretion appears intended in the administration of the PKU test. Thus, the institution must make certain that a satisfactory test is performed except when religious objection is raised."

IV. *Conclusion and Recommendations*—It is the opinion of the Committee that:

A. PKU testing of the newborn is necessary and desirable.

B. PKU testing of the newborn is a measure of good medical practice in our community today.

C. That a hardship has resulted from implementation of the present law has not been substantiated.

D. The law should be a matter of deep concern to the medical community in that it serves as a precedent for similar future legislation. All of us strive for good medical care for our patients. To be ordered to do so by a state law is an insult to our cumulative medical intelligence.

E. In spite of our strong feelings against medical legislation, we cannot foresee repeal of the PKU law at this time. We feel that if hardship cannot be proven it is most unlikely the law would be repealed on principle. Two amendments seem warranted, however:

(1) Discretion should be given the hospital administrator who in certain instances finds it impossible to locate the parent. Involvement of the parent in the follow-up process should be seriously considered.

(2) Mandatory screening should not mean mandatory treatment. This will permit further experimentation and research to continue.

F. Ferric chloride testing on PKU should be continued in the physician's office in addition to the Guthrie test in the hospital. Many physicians have discontinued this procedure since enactment of the law.

This report respectfully submitted, November 30, 1967

Raymond L. Clemmens, MD

Robert E. Yim, MD, Chairman

Tissue's healing nicely. Yet anxiety slows his steps toward recovery.

By helping overcome anxiety and tension which can thwart the convalescent's progress, Equanil® often may play an important role in medical and surgical aftercare.

Indications: For use in management of anxiety and tension occurring alone or as accompanying symptom complex to medical and surgical disorders and procedures. Though not a hypnotic, fosters normal sleep through antianxiety and related muscle-relaxant properties.

Contraindications: History of sensitivity to meprobamate.

Important Precautions: Carefully supervise dose and amounts prescribed, especially for patients prone to overdose themselves. Excessive prolonged use has been reported to result in dependence or habituation in susceptible persons, as alcoholics, ex-addicts, and other severe psychoneurotics. After prolonged excessive dosage, reduce dosage gradually to avoid possibly severe withdrawal reactions. Abrupt discontinuance of excessive doses has sometimes resulted in epileptiform seizures.

Warn patients of possible reduced alcohol tolerance, with resultant slowing of reaction time and impairment of judgment and coordination.

Reduce dose if drowsiness, ataxia or visual disturbance occurs; if persistent, patients should not operate vehicles or dangerous machinery.

Side Effects include drowsiness, usually transient; if persistent and associated with ataxia, usually responds to dose reduction; occasionally concomitant CNS stimulants (amphetamine, mephentermine sulfate) are desirable. Allergic or idiosyncratic reactions are rare, but such reactions, sometimes severe, can develop in patients receiving only 1 to 4 doses who have had no previous contact with meprobamate. Previous history of allergy may or may not be related to incidence of reactions. Mild reactions are characterized by itchy urticarial or erythematous maculopapular rash, generalized or confined to groin. Acute nonthrombocytopenic purpura with cutaneous petechiae, ecchymoses, peripheral edema and fever have been reported. One fatal case of bullous dermatitis following intermittent use of meprobamate with prednisolone has been reported. If allergic reaction occurs, meprobamate should be stopped and not reinstituted. Severe reactions, observed very rarely, include angioneurotic edema, bronchial spasms, fever, fainting spells, hypotensive crises (1 fatal case), anaphylaxis, stomatitis and proctitis (1 case) and hyperthermia. Treat symptomatically as with epinephrine, antihistamine and possibly hydrocortisone. Aplastic anemia (1 fatal case), thrombocytopenic purpura, agranulocytosis and hemolytic anemia have occurred rarely, almost always in presence of known toxic agents. A few cases of leukopenia, usually transient, have been reported on continuous administration.

Meprobamate may sometimes precipitate grand mal attacks in patients susceptible to both grand and petit mal. Extremely large doses can produce rhythmic fast activity in the cortical pattern. Impairment of accommodation and visual acuity has been reported rarely. After excessive dosage for weeks or months, withdraw gradually (1 or 2 weeks) to avoid recurrence of pretreatment symptoms (insomnia, severe anxiety, anorexia). Abrupt discontinuance of excessive doses has sometimes resulted in vomiting, ataxia, tremors, muscle twitching and epileptiform seizures. Prescribe very cautiously and in small amounts for patients with suicidal tendencies. Suicidal attempts have resulted in coma, shock, vasomotor and respiratory collapse and anuria. Excessive doses have resulted in prompt sleep; reduction of blood pressure, pulse and respiratory rates to basal levels; and occasionally hyperventilation. Treat with immediate gastric lavage and appropriate symptomatic therapy. (CNS stimulants and pressor amines as indicated.) Doses above 2400 mg./day are not recommended.

Composition: Tablets, 200 mg. and 400 mg. meprobamate. Coated Tablets, WYSEALS® EQUANIL (meprobamate) 400 mg. (All tablets also available in REDIPAK® [strip pack], Wyeth.) Continuous-Release Capsules, EQUANIL L-A (meprobamate) 400 mg.

ON BALTIMORE'S MENTAL HEALTH PROBLEMS AND NEEDS

The continuing increase observed for some time in the number of admissions to Maryland's mental hospitals is primarily related to the growing demand for inpatient treatment by Baltimore City residents. While admission rates have traditionally been higher in the city than in other areas of the state this gap, as shown in the following table, has widened noticeably in recent years.

ADMISSION RATE*

Fiscal Year	Total	Baltimore City	Four Suburban Counties	Nine Eastern Shore Counties	Ten Other Counties
1967	306.7	643.1	171.4	297.9	169.9
1966	279.0	516.9	166.7	306.8	186.6
1965	249.3	457.0	150.8	295.0	156.8
1964	234.7	415.3	143.1	267.7	161.5
1963	221.4	377.7	137.2	275.3	139.2

**Number of admissions per 100.000 estimated population in specified area and year.*

Baltimore, like most urban centers, has a population virtually stationary in size which accounts for a declining proportion of total state residents. While 28.8% of Maryland's population lived in the city at the beginning of 1963, this had decreased to 25.3% by 1967. Despite this, 48.5% of the 7,257 state hospital admissions in 1963 and 53.0% of the 11,091 admissions in 1967 lived within the city confines. A similar upward trend has been observed in psychiatric outpatient units.

An earlier report,* based on data from the Maryland Psychiatric Case Register, showed that major variations existed also within Baltimore. This study reported that admissions to inpatient care during a three-year period (1961-1964) ranged from 0.42% of the total population in outlying areas to 8.16% in inner city tracts. These data reflect a general pattern of rising health needs produced by the changing composition of Baltimore's population. It is a result of the mass exodus of white middle-class residents to the suburban counties and a concomitant increase in the number of poor, culturally deprived, community dependent city residents.

One effort to reduce the need for hospitalization has involved the establishment of a comprehensive community mental health center covering an area south and west of downtown Baltimore. However, this center when fully operational can have only limited impact since it will serve less than 10% of the city's total population. Clearly, concentrated endeavors to resolve these problems must involve the development of other centers together with the integration and coordination of mental health and other community agencies and programs serving urban inner core areas.

*Klee, Gerald D., Bahn, Anita K., Spiro, Evelyn and Gorwitz, Kurt; An Ecological Analysis Of Diagnosed Mental Illness In Baltimore, Psychiatric Research Report 22, American Psychiatric Association.

The Cost of Hospitalization

The average total cost of treating a patient in Maryland's psychiatric hospitals from admission until ultimate discharge decreased 40% during the past 12 years and is now at its lowest level. As indicated in the following table, while average daily per patient expenditures more than tripled during this period, increased turnover resulting primarily from shortened periods of hospitalization produced a continuing decline in the cost per live discharge.

FISCAL YEAR	AVERAGE NUMBER OF HOSPITALIZED PATIENTS	TOTAL PATIENTS TREATED	LIVE DISCHARGES	DAILY PER PATIENT COST	COST PER PATIENT TREATED	COST PER LIVE DISCHARGE
1956	9,530	15,019	2,511	$ 3.38	$ 785.55	$4,698.58
1960	8,576	16,268	3,953	5.08	977.09	4,021.09
1964	8,035	19,424	7,197	7.05	1,067.37	2,880.74
1968 (est.)	7,758	23,387	11,275	11.04	1,340.54	2,780.60
PERCENT CHANGE (1968 vs. 1956)	—18.6	+55.7	+349.0	+226.6	+70.6	—40.8

Hospital expenditures increased an average of 9% annually between 1956 and 1968. In terms of daily cost per patient, this represents a total rise of 226.6% (from $3.38 to $11.04). However, during the same time period, the number of patients treated each year rose 55.7% (from 15,019 to 23,387) and live discharges increased 349.0% (from 2,511 to 11,275) while the average daily number of patients declined 18.6% (from 9,530 to 7,758). In 1956 an average expenditure of $4,698.58 was required to produce each of that year's 2,511 discharges. It is estimated that the average cost for each of the 11,275 discharges in the current year will be $2,780.60.

While these data reflect a general reduction in the length of hospitalization of virtually all diagnostic categories of patients, they also relate to the expanding use of state hospitals for intensive, short term treatment of acute nonpsychotic disturbances. Individuals with diagnoses such as alcoholism, brain syndromes, psychoneurotic disorders and personality disturbances now account for a majority of the patient population and for more than two-thirds of all admissions. Among those currently accepted for hospitalization, more than half are released within six weeks and better than 90% are returned to the community within one year.

These statistics indicate that Maryland's mental hospitals are in a state of rapid transition. The long-term chronically ill no longer predominate and their proportion of the patient population can be expected to continue declining. Concomitantly, an increasing percentage of all patients will be acutely ill and will be hospitalized only for brief periods. As this trend continues, the average daily per patient cost must be expected to rise further, ultimately approaching comparable figures for general hospitals. They can also be expected to produce further increases in the number of patients treated and an additional appreciable decline in the total cost of each treatment episode.

ERYTHROMYCIN-
TRISULFAPYRIMIDINES,
ABBOTT

FOR RAPID CLINICAL RESPONSE

In a recent series of clinical studies, Erythrocin-Sulfas was used to treat 516 febrile cases of suspected bacterial infection. Of these, *85.5% were completely afebrile within 48 hours.*

FOR WIDE BACTERIAL COVERAGE

Among the total of 661 patients (febrile and afebrile) who could be evaluated, the *clinical cure rate* was 92.2%*

FOR OPTIMAL PATIENT ACCEPTANCE

Three forms were used in the studies, prescribed according to the age and personal preferences of individual patients:

Erythrocin® ethyl succinate-**Sulfas Granules**
erythromycin ethyl succinate-trisulfapyrimidines
for oral suspension

Erythrocin® ethyl succinate-**Sulfas Chewable**
erythromycin ethyl succinate-trisulfapyrimidines
chewable tablets

Erythrocin® stearate-**Sulfas Filmtab®**
erythromycin stearate-trisulfapyrimidines tablets

Please see Brief Summary on next page.

ABBOTT

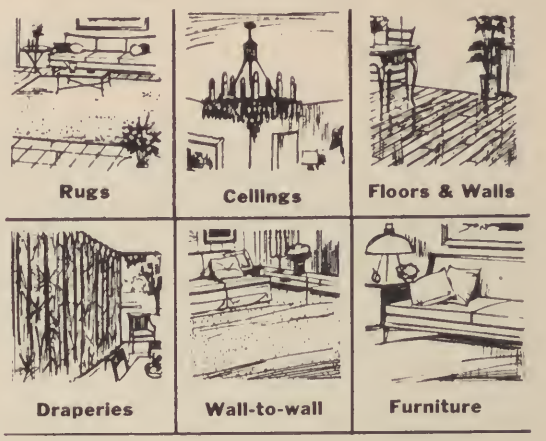
*Clinically cured included patients with complete symptomatic relief and those who had partial symptomatic relief within 72 hours with subsequent clinical cure.

803446

BRIEF SUMMARY FOR
Erythrocin®-Sulfas

Indications For mixed infections which are more susceptible to the combination than to either agent alone. These may include susceptible gram-positive and/or gram-negative mixed infections. Not recommended in the treatment of infections expected to respond to full therapeutic doses of the antibiotic or sulfonamide alone.

Contraindications Known hypersensitivity to erythromycin or sulfonamides. Because of the possibility of kernicterus with sulfonamides, do not use in pregnancy at term, in premature or in newborn infants during first week of life.



Warnings As with other forms of sulfonamide therapy, use only after critical appraisal in patients with liver or kidney damage, urinary obstruction, or blood dyscrasias. Deaths have been reported from hypersensitivity reactions and blood dyscrasias following use of sulfonamides. Perform blood counts and liver and kidney function tests when used intermittently or for long periods.

Precautions, Side Effects Use sulfonamides with caution in patients with a history of allergy, including asthma. Mild allergic reactions (such as urticaria and other skin rashes) may occur. Serious allergic reactions have been extremely infrequent; if encountered appropriate countermeasures (e.g. epinephrine, steroids, etc.) should be administered and the drug withdrawn. Assure adequate fluid intake to prevent crystalluria and institute alkali therapy if indicated. In prolonged therapy, or when high dosage is used, maintain an alkaline urine. If oliguria occurs, discontinue therapy. Occasionally mild abdominal discomfort, nausea or vomiting may occur with erythromycin; generally improved by reduction of dosage.

If overgrowth of nonsusceptible organism occurs, withdraw the drug and institute appropriate treatment.

Adverse Reactions Sulfonamide therapy may be associated with headache, nausea, vomiting, diarrhea, hepatitis, pancreatitis, blood dyscrasias, neuropathy, drug fever, skin rash, urticaria, injection of the conjunctiva and sclera, petechiae, purpura, hematuria and crystalluria.. 803446

Critical Nurse Shortage Worsens

The registered nurse — that angel in the starched white uniform—is becoming a rare bird.

Not only are there over 100,000 too few of her today, but in about three years it is estimated there will be an even more critical shortage of nearly 200,000 nurses.

A Health Insurance Institute review of national statistics indicates that the shortage blankets the country.

According to the U. S. Public Health Service, the nation has only about 80 per cent of the registered nurses it needs to help care for the sick and injured.

In some areas the shortage is so acute that hospitals have been forced to limit their services. In New York City's huge Bellevue Hospital a single registered nurse is sometimes responsible for 300 patients on seven floors.

Not Enough

Government figures show approximately 750,000 registered nursing positions in the United States—a number that many agree could not provide the best of care even if completely filled.

As 1967 began only 640,000 nurses were practicing, about one-fourth of whom worked part time.

The latest comprehensive government survey on nursing needs highlighted the fact that by 1970, 850,000 full-time R. N.'s would be needed to provide adequate care for the increased population.

Even this estimate may have to be revised. It was made before the full impact of benefits under the government-sponsored Medicare and Medicaid programs could be calculated.

At present growth rates, only 680,000 nurses will be available in 1970 to fill the nation's minimum need of 850,000 at that time.

Many officials concerned with the shortage believe the answer is a better income and better working conditions.

Although wages have recently been increased in a few parts of the country, the average is still only a little over $5,000 a year. In some sections it is much lower.

And working conditions today, necessarily because of the usual staff and nursing shortages, are not what they could be in most hospitals.

For instance, when a hospital is understaffed, a nurse must often do work that has little to do with her specialized training, such as cleaning equipment, preparing medications that the pharmacist should be preparing, running errands, filing medical records, and the like.

Dissatisfaction

When all these unprofessional chores are finished, studies show that nurses have time left to employ only about 25 per cent of their professional skills in the day-to-day care of patients.

Often, a nurse's dissatisfaction with working conditions is reflected in her frequent job shifting. A nurse's turnover rate is about 70 per cent, a figure exceeded only by waitresses.

Another way to relieve the shortage, many experts believe, is to attract more members of minority groups to the profession. For example, although Negroes are accepted in most nursing schools, they still make up only three per cent of the country's enrollment, exactly the same as 20 years ago.

A Public Health Service report noted: "The small proportion (of Negroes in nursing) is probably due both to discrimination in admissions and to inadequate secondary education."

In some areas, these problems are being overcome. Recently the Sealantic Fund, established by the late John D. Rockefeller, Jr. granted $140,000 to six colleges to encourage their nursing schools to recruit and tutor interested Negroes.

The shortage has had its bizarre effects, too.

According to the Institute, one medium-sized New York City medical center spent over $150,000 on classified ads alone in its search for nurses.

A hospital on Long Island rented a blimp to cruise over Manhattan with the words "Nurses. Call This Number: . . . ," painted in 10 foot high letters on its sides.

The phone number was that of the hospital, and the intention was recruitment. It didn't work out all that well.

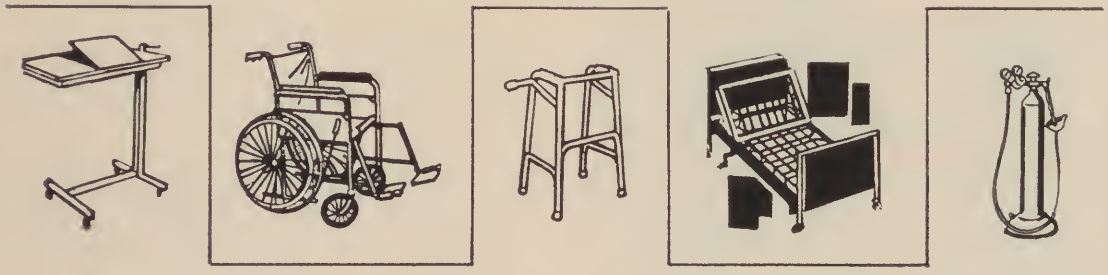
AMA Establishes Approval Program for Certified Laboratory Assistants

The American Medical Association's Council on Medical Education has established, in cooperation with the American Society of Clinical Pathologists, and approval program for certified laboratory assistants.

It is the ninth health occupation for which the AMA now maintains approval programs to assure that training standards acceptable to the medical profession are being met.

Before the AMA established the approval program last December, schools for certified laboratory assistants were approved only by the American Society of Clinical Pathologists.



The original certification program, aimed at providing standardized training and national certification under medical auspices, was initiated in 1963 by the ASCP and the American Society of Medical Technologists.

Upon completing an accredited 12-month course of hospital or laboratory school training and passing an examination, graduates are designated as certified laboratory assistants. To meet the increased demands for laboratory service, it is estimated that 100,000 certified laboratory assistants will be needed by 1975.

The current list of AMA-approved schools for laboratory assistants, as well as lists of other AMA-approved or accredited schools—cytotechnology, inhalation therapy technician, medical record librarian, medical record technician, medical technology, occupational therapy, physical therapy and x-ray technology—may be obtained by writing the AMA's Department of Allied Medical Professions and Services.

A six-page pamphlet, "A Career for You as a Certified Laboratory Assistant," may be obtained by writing the Secretary, Board of Certified Laboratory Assistants, 445 N. Lake Shore Drive, Chicago, Illinois 60611.

BALTIMORE CITY DENTAL SOCIETY JOINT MEETING WITH THE BALTIMORE CITY MEDICAL SOCIETY

Wednesday, May 8, 1968, 8:00 P.M.
Speaker: Leonard M. Estad, PhD, President, Gallaudet College, Washington, D. C.
Subject: the Story of the Congenital Deaf Child from Cradle to College
Place: 1211 Cathedral Street, Baltimore, Md.

* * *

The monthly meeting of the Board of Directors of the Baltimore City Medical Society was called to order by Frank Kaltreider, MD, on March 12, 1968 at 1211 Cathedral Street. Two members of the Board were absent.

The minutes of the February meeting were approved as circulated.

S. H. Barranco was recommended for emeritus membership.

The resolutions to be presented before the House of Delegates at the forthcoming meeting were read and discussed in detail. The Board is in favor of the following resolutions:

1. **Condemning attempts by insurance carriers to determine qualifications of physicians and requesting that such carriers amend their regulations to prevent this.**
2. **Endorsement of retention of the present board of post-mortem examiners as a separate government agency.**

The Board of Directors feels they cannot recommend the following resolutions:

1. Authorizing the Council, in special instances, to waive by-laws requirements that physicians defense be granted only if dues are paid by January 31st of the year in which the event occurred.
2. Urging physicians to charge their usual, customary and reasonable fees under Public Law 89-97, Title 18 of the Social Security Law, and not to complete assignments in this regard.

The Board of Directors charged Dr. Kaltreider to select a committee to examine in detail the proposal of Faculty position taken in 1962 regarding incorporation of a self-employed person.

It was the Board's recommendation that this committee look into the corporate practice of medicine from the moral, ethical, and economical point of view and report to the Board at the April 5 meeting.

The next item on the agenda was a report by H. Moses, MD, Chairman of the Program Committee. It was Dr. Moses' opinion that the recent policy of the Medical Society meeting in various community hospitals has not been successful. He pointed out that the attendance of the last meeting at Church Home and Hospital was poor and that there is difficulty in arranging such programs within the individual hospitals. He suggested that the meetings be changed back to the Faculty building on Cathedral Street. The Board discussed the problem briefly and decided to follow his suggestion.

The Board of Directors discussed and reviewed Senate and House Bills. The Board feels the following House Bills should be opposed by the Baltimore City Medical Society:

1. *House Bill* 273—authorizing the Governor to do certain necessary things to develop a mechanism for comprehensive Health planning.
2. *House Bill* 274—providing that a license to open or continue a hospital not be issued unless it conforms to the Comprehensive Health Plan.
3. *House Bill* 275—requiring the State Health Department to develop, study and revise, from time to time, a cost procedures and cost standards program and a plan relating to services in the hospital.
4. *House Bill* 1022—providing that pharmacist may substitute generic drug for one prescribed by physician under certain circumstances, and compilation of list of drugs which can be furnished under generic name.
5. *House Bill* 1112—requiring administering of Chloramphenicol and other toxic drugs be administered only to patients admitted to licensed hospitals, requiring certain tests and other regulations concerning this drug.
6. *Senate Bill* 372—provide for establishment in State Department of Health of a birth defects institute (This Bill tends to restrict research as it is now worded).

The Board is in favor of the passage of *House Bill 21*—establishing commission on medical discipline; and *House Bill 88*—having to do

mudrane®

for

- EMPHYSEMA
- ASTHMA
- CHRONIC BRONCHITIS
- BRONCHIECTASIS

The fast-disintegrating uncoated tablet gives relief in 15 minutes

Each tablet contains:

Potassium Iodide . . . . . 195 mg.
Aminophylline . . . . . 130 mg.
Phenobarbital, Caution: May be habit forming . . . 21 mg.
Ephedrine HCl . . . . . 16 mg.

FEDERAL LAW PROHIBITS
DISPENSING WITHOUT PRESCRIPTION

Precautions: Usual for aminophylline-ephedrine-phenobarbital. Iodides may cause nausea, long use may cause goiter. Discontinue if symptoms of iodism develop.

Iodide contraindications: tuberculosis, pregnancy.

DOSAGE

One tablet, with full glass of water, 3 or 4 times daily.

Dispensed in bottles of 100 and 1000 tablets.

MUDRANE GG—Formula, dosage and package identical to Mudrane—*except*—100 mg. glyceryl guaiacolate replaces the potassium iodide. The value of Mudrane cannot be enjoyed by a small group in which K.I. is contraindicated. Mudrane GG is prepared for this group.

MUDRANE GG ELIXIR—Four 5 cc teaspoonfuls is equivalent to one Mudrane GG tablet. Dosage adjusted to age and weight of child. Mudrane GG Elixir is for pediatric patients and those who think they cannot swallow tablets. Dispensed in pint and half gallon bottles.

with abortion laws; *Senate Bill 50*—which could make it unlawful to sell, transfer or barter glue and glue products; *Senate Bill 78*—increasing the number of medical scholarships and amending provisions for admission by the School of Medicine; and *Senate Bill 75*—implied consent.

The Woman's Auxiliary plans for observance of Doctors' Day to be held on March 30th were reported to the Board of Directors.

A report of the election of Delegates and Alternates at the March 1st meeting was presented.

It was recommended that Dr. Kaltreider form a committee to examine the possibility of obtaining a full-time Executive Secretary for the Baltimore City Medical Society.

The Science of Communication as practiced at Monumental Printing

It's more than a science: it's an Art, the precise transliteration in print of an intangible idea for a heterogeneous group of critical readers.
Here, at Monumental Printing, we learned to handle the tools of intelligent communication by the empirical method: working with them. The brush and palette of our art, the chisel, the score, the script are simply words on paper. We learned their proper use over 50 years of practice by being permitted to print such Journals as:

Clinical Chemistry
Digestive Diseases
Fertility & Sterility
Occupational Medicine
Leprosy
Mental Hospitals
Psychiatric Studies and Projects
Psychosomatic Medicine

We speak *your* language. We know the difference between edema and enema; syndrome and symptom; sewage and seweroge. And when and why we should use 12 point Caslon Bold instead of 10 Stymie.

If you, too, need a *good* printer, let's communicotel

AMA's 11-Point Statement of Responsibilities

The American Medical Association has issued an 11-point statement regarding the purposes and responsibilities of the AMA. Broad initiative in advancing health care for everyone is detailed in the expanded statement which has been adopted by the AMA's House of Delegates.

The statement declares it is the responsibility of the AMA, as the representative of the American medical profession, to continue to foster the advancement of medical science and the health of the American people and to discharge that responsibility through the following means:

1. By Encouraging the advancement of medical knowledge, skills, techniques and drugs; and by maintaining the highest standards of practice and health care.
2. By creating incentives to attract increasing numbers of capable people into medicine and the other health-care professions.
3. By advancing and expanding the education of physicians and other groups in the health-care field.
4. By motivating skilled physicians who have the art of teaching to apply themselves to developing new generations of excellent practitioners.
5. By fostering programs that will encourage medical and health personnel to serve voluntarily in the areas of need for medical care.
6. By developing techniques and practices that will moderate the costs of good medical and health care.
7. By seeking out and fostering means of making all health care facilities—physicians' offices, hospitals, laboratories, clinics and others—as efficient and economical as good medical practice and attention to human values will permit.
8. By combining the utilization of the latest knowledge for prevention and treatment with the vital healing force of the physician's personal knowledge of and devotion to his patient.
9. By maintaining the impetus of dedicated men and women in providing excellent health care by preserving the incentives and effectiveness of unshackled medical practice.
10. By maintaining the highest level of ethics and professional standards among all members of the medical profession.
11. By providing leadership and guidance to the medical profession of the world in meeting the health needs of changing populations.

unanimous first choice...

of medical people everywhere. Maryland's largest group of convalescent and rehabilitative centers.

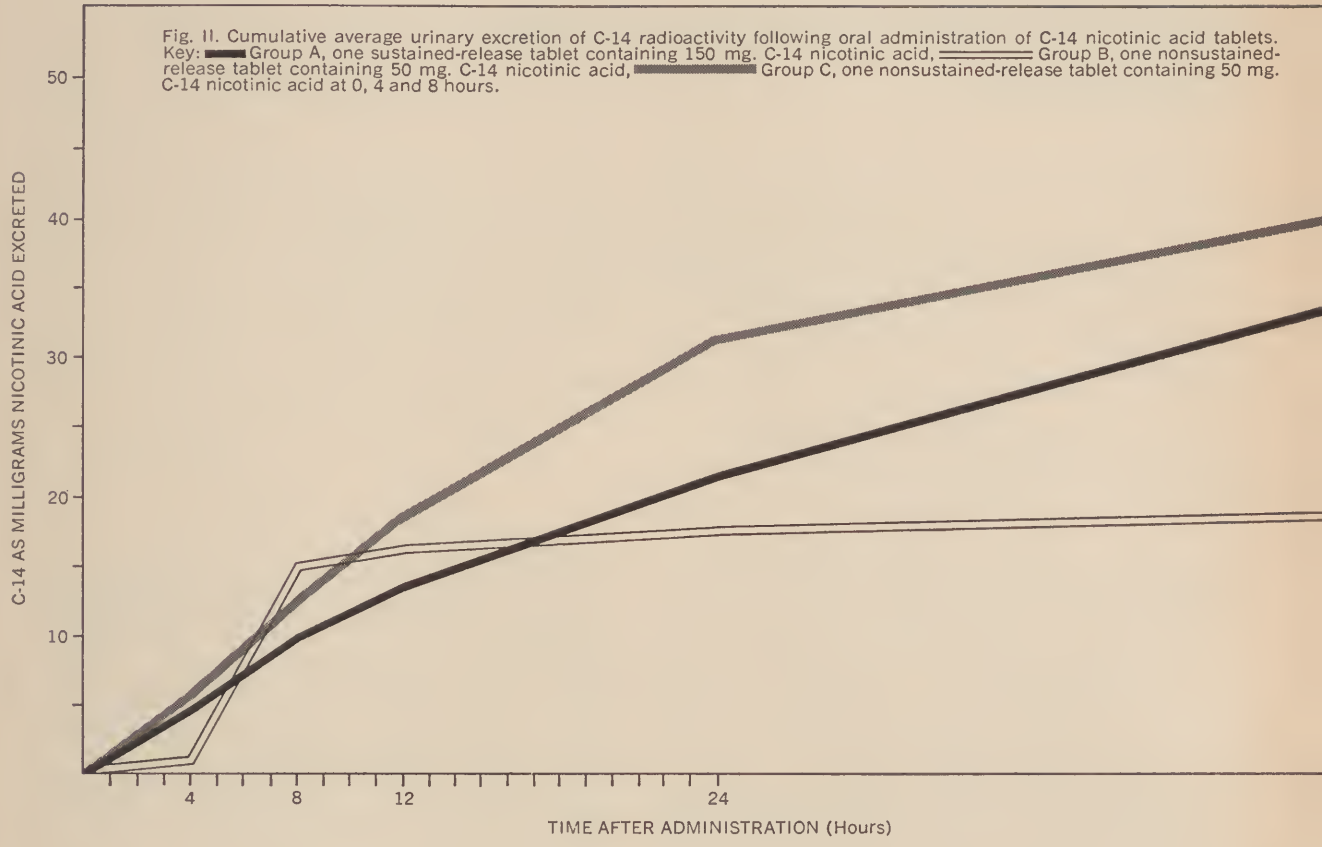
Sustained circulatory, respiratory and cerebral stimulation for the

(fewer absent doses by absent-minded patients)



Human volunteer subjects were administered Geroniazol TT tablets with the nicotinic acid component made radioactive with C-14. Plasma and urine samples were analyzed. (See Figures I and II) The radioactive tracer study substantiated the previous clinical evidence that the release of nicotinic acid from the Geroniazol TT tablet produced a gradual rise in plasma levels to a plateau for a total of 12 hours and more.

Such proven sustained activity makes the management of geriatric patients much easier by minimizing the possibility of neglected doses through absent-mindedness or senile confusion. Therapy *can* be continuous on a daily dose of only one Geroniazol TT tablet every 12 hours.

The gradual release of nicotinic acid in Geroniazol TT will provide the well-known peripheral vasodilatation needed in patients with deficient circulation and with a minimum amount (if any) of "flushing." Also, cerebrovascular circulation is complemented by pentylenetetrazol, long-established as a cerebral and respiratory stimulant.

Geroniazol TT improves the typical, unfortunate, signs of senile confusion. Patients become more alert,

aged and debilitated

less confused and moody. Personal care, memory, emotional stability, social attention improve. Fatigue, apathy and irritability are reduced.

A prescription for 100 tablets of Geroniazol TT will permit your patients to enjoy the benefits of time-prolonged nicotinic acid/pentylenetetrazol therapy, at an economical price. Dosage is only one tablet every 12 hours.

Contraindications: There are no known contraindications.

Precautions: Exercise caution when treating patients with a low convulsive threshold.

Side Effects: Side effects are rarely encountered, however due to the vasodilatation effect of nicotinic acid, transitory mild nausea, flushing, tingling and pruritus are possible.

Dosage: One tablet every 12 hours.

Supplied: Prescribe bottles of 100 tablets, to take advantage of recent price reduction.

Rehabilitation Notes

DOUGLAS G. CARROLL, MD, EDITOR

*ARTHRITIS FOUNDATION SERIES**

Osteoarthritis

Osteoarthritis, one of the oldest diseases known to man, is in many respects scarcely less an enigma today than when first described. In fact, it is a growing problem in management, with increasing longevity of the population.

B. STANLEY COHEN, MD

Recent studies in Britain, of 1098 males and 1198 females, revealed 52% of the men and 51% of the women with moderate to severe X-ray stigmata of osteoarthritis.[1] In general, there was a low complaint rate, but in the age group over 55 years, incapacity was associated with the osteoarthritis.

The first cycle of the United States Health Examination Survey, between 1959 and 1962, seeking to develop statistics on the health status of the population, disclosed an incidence of osteoarthritis of 37%.[2] The incidence increased, as might be expected, with advancing age, from 4% in the age group 18-24 to 85% in the age group 75-79. Studies were based on history, physical examination, bentonite flocculation studies, and graded X-rays on the hands and feet. The results indicated that 23% of those with osteoarthritis had moderate or severe involvement. No pattern of racial, regional, or urban-rural differences was noted. The incidence among craftsmen, miners, and construction workers, however, was high.

The etiology of the process is still not well established but the disease evidently results from a combination of factors. Indeed, it is not a single process, but as Kellgren has pointed out, most likely a form of "articular failure which, like cardiac or renal failure, may result from a variety of processes."[3] Genetic or environmental factors appear to determine which joint or joints become affected, and local articular processes determine the type and extent of involvement.

Types of Involvement

Secondary degenerative joint disease follows trauma and excessive mechanical stress, particularly evident in weight-bearing joints. Primary, or idiopathic arthritis, seems to follow genetic patterns. Sokoloff has demonstrated osteoarthritis in mice to be a genetically governed disease involving multiple genes, with an overall recessive behavior.[4] The studies of Heberden's nodes have shown that degenerative joint disease in man is genetically influenced.[5] Heberden's nodes have been found to occur twice as often in the mother and three times as often in the sisters of patients than in the general population. The primary generalized osteoarthrosis described by Kellgren[6] also follows an inherited pattern, associated with Heberden's

**The Arthritis Foundation (Maryland Chapter, 12 W. 25th St., Balto., Md. 21218) is arranging a series of articles by experts on arthritis to appear from time to time in Rehabilitation Notes.*

nodes. The studies suggest a genetic pattern which is dominant in females and recessive in males. Environmental factors may bring out a hereditary predisposition for Heberden's nodes in males. The health survey pointed up a higher than expected incidence of osteoarthritis in the hands of craftsmen, who subject their hands to long periods of stressful activity.

The development of changes in one or several joints, usually in the weight-bearing portions of the body, and without association with Heberden's nodes, can be shown to be associated with trauma and mechanical stress. Thus, the occurrence of osteoarthritis is seen in the lumbar spine in coal miners and others doing heavy labor;[7] osteoarthritis may develop in a single joint following severe trauma, with internal derangement; malum coxae senilis occurs in a hip previously involved by Legg-Calvé-Perthes disease or the site of congenital hip anomaly; osteoarthritis is seen in knees with mechanical derangement secondary to genu varus or valgus, with foot abnormalities and compounded by obesity.

Pathological Findings

Regardless of etiology, and in all joints, the pathological findings are essentially the same. Fibrillation and deterioration of the cartilage and overgrowth of juxta articular bone are the hallmarks. Subchondral sclerosis, cyst formation, and disorganization of the trabecular pattern are seen. There is general agreement that inflammatory changes, with synovitis, are not a component of uncomplicated osteoarthritis.[8] An exception is a recently reported form of osteoarthritic associated with a distinct inflammatory synovitis.[9] Here, in the proximal interphalangeal joints and the distal interphalangeal joints, in addition to cartilage destruction and osteophyte formation, were seen erosion of cartilage and juxta articular bone, and a synovium with villous hypertrophy resembling rheumatoid arthritis. Absence of involvement in other joints and negative tests for rheumatoid factor were noted. The authors have named the process "Erosive osteoarthritis."

Only a small portion of those with pathological lesions of osteoarthritis have symptoms. Osteoarthritis seems therefore to be predisposing toward, rather than the cause of symptoms. The painful episodes are related to ligamentous sprains and to traumatic synovitis following minor, sometimes trivial, injury to the joint. Joints subject to weight bearing or rendered more vulnerable to trauma by motion are most likely to be symptomatic. Lawrence has pointed out that the relationship of X-ray to symptoms is determined largely by the natural mobility of the joint. Thus, in the fingers, the association is greater in the proximal than in the distal joints.[1]

Diagnosis and Treatment

Symptoms are generally joint pain, on motion and weight-bearing; stiffness after periods of rest; and aching with inclement weather. The symptoms usually begin and progress insidiously and episodically. Additional symptoms may be related to impingement on adjacent structures. In cervical arthritis, root compression may result in pain radiating into the upper extremities; and impingement on the cord, or interruption of its circulation, may result in long tract signs, including spasticity and paraparesis. Costovertebral joint involvement may impinge on intercostal nerves, with symptoms simulating chest pain of other etiology. Patterns of referred pain may alter presenting symptomatology. Thus, arthritis of the hip may produce pain referred to the groin or medial aspect of the knee.

Examination reveals crepitation on joint motion, change in the shape of the bone, and limitation of joint motion. There may be muscle spasm or muscle atrophy in areas adjacent to the joint. Systemic symptoms, except in the case of the primary generalized form described by Kellgren, are not noted. Laboratory studies are of value only for the exclusion of other conditions. The synovial fluid is usually clear and viscous, with a normal mucin clot, and with a low white cell count.

Diagnosis may usually be confirmed by X-ray findings but the presence of X-ray evidence of osteoarthritis in the symptomatic patient does not necessarily mean that the symptoms are due to osteoarthritis. The generally low complaint rate associated with radiographic evidence of osteoarthritis requires that other systemic causes of symptoms be considered and excluded.

Management of the patient with osteoarthritis is determined by the specific joints affected, but generally involves certain basic principles. Treatment is directed at the removal of aggravating factors contributing to additional trauma, such as obesity, mechanical abnormalities, and postural faults. Postural correction may be accomplished by exercises, external support, and shoe modifica-

tions. Rest of the affected part represents an important phase of treatment. This may be accomplished by reducing or avoiding weight-bearing, or by the use of ambulatory aids such as canes, crutches, or occasionally, long-leg braces. Support in recumbency with a firm mattress and bedboard is helpful.

Relief of pain may be accomplished with analgesic medications, the most useful of which is aspirin. Dosage should be adequate. Small or erratic dosage is usually ineffective. Aspirin in the amount of 2.5—3.5 grams daily, in divided dosages, may be effective. Drugs with greater toxicity are not usually justified. Some patients, however, may be benefited by low dosage phenylbutazone[10] or indomethacin.[11] Muscle relaxants are of little value. Systemic steroids are rarely justified, particularly in the post-menopausal woman where the risk of osteoporosis is greater. Intra-articular cortico steroids have been found to be helpful in those cases with associated traumatic synovitis.

In many controlled studies, the placebo effect of drugs and physical agents has been shown to be considerable. Joint injection is a particularly successful form of placebo therapy. In one study, 11 of 18 patients with osteoarthritis of the knees experienced relief of pain and increase in function following intra-articular saline injection. Placebo tablets afforded relief in four of 19.[12]

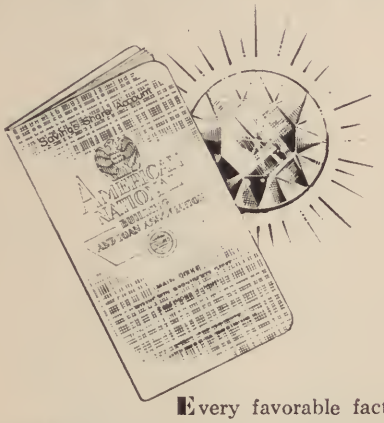
Physical measures have a good deal to offer the arthritic. Heat affords temporary relief, and helps to relax muscle spasm and prepare for therapeutic exercise to follow. Moist heat, in the form of hot packs, is generally available and is effective. Short wave diathermy may be helpful in specific cases, as in the knees, and the use of ultrasound therapy has been helpful in affording relief in the painful hip. Paraffin immersion is particularly helpful for the small joints of the hand, is inexpensive and easily adapted to home use.

In addition to rest and measures for relief of pain, exercises are prescribed for the purpose of maintaining joint range of motion and avoiding or overcoming contractures. Normal power should be restored and maintained in the muscles about an involved joint. In the knees, particularly, progressive resistance quadriceps exercises are important. An adequate extensor mechanism helps protect the knee from further trauma. In arthritis of the lumbar spine, exercises to increase the power of the abdominal and back muscles are helpful. In cervical arthritis, traction, sustained or intermittent, may be useful in relieving root pain. Traction for the lumbar spine is generally ineffective compared with the cervical spine.

As in the management of rheumatoid arthritis, the program of heat and exercise should be individually prescribed, and should be one that can be carried on at home by the patient for long periods. The program should involve minimum expense and should be one which is acceptable to the patient over many months or years. Efforts should be made to encourage him and sustain his motivation, through regular re-evaluation and adjustment of the program.[13]

Surgical Treatment

In selected patients, where conservative medical management is unsuccessful, surgery may be required. Ideally, orthopedic procedures should be preventive measures, early in life, to correct such problems as scoliosis, and mechanical abnormalities of the hips, knees and feet.



A number of procedures have been developed for the relief of pain and improvement of function in arthritis of the hip. Arthrodesis gives relief from pain, though at the sacrifice of mobility, and is useful in the younger active patient with unilateral disease and a mobile lumbar spine. Osteotomies, to change weight-bearing angles, and prosthetic replacement are successful in selected cases. A resection angulation operation, described some years ago, has been re-emphasized by Milch as a useful procedure.[14] Salvage procedures such as the Girdlestone and "hanging hip" operations are used to relieve pain in late cases where function has already been significantly impaired.

Osteotomy and other correctional procedures are useful in the knees and feet. Removal of bony spurs and foraminotomy have been helpful where spinal osteophytes encroach on neural structures. Anterior cervical fusion has gained prominence in recent years for cervical arthritis with segmental root compression and cervical spondylosis.

Summary

The general approach to the patient with symptomatic osteoarthritis calls for reassurance and emotional support; for measures to provide rest and relief of pain; for correction of mechanical factors which may result in the progression of arthritis; and for maintenance of mobility and optimum function. This may entail, under various circumstances, the use of drugs, physical therapeutic measures, braces and supports, and preventive and correctional surgery.

VD Poll to be Repeated

On July 1, 1968, all practicing physicians in the U. S. will receive a questionnaire asking the number of cases in infectious syphilis, other stages of syphilis and gonorrhea treated by them from April 1 through June 30, 1968.

This survey, entitled, "National Survey of VD Incidence," is a repeat of a similar 1962 poll and is sponsored jointly by the American Medical Association, the American Osteopathic Association, the National Medical Association, American Social Health Association in cooperation with the Public Health Service.

Current estimates show that VD is infecting Americans at the alarming rate of 1,100,000 cases a year and is now the nation's most urgent communicable disease problem. Indications are that private physician reporting has increased considerably since the 1962 survey, which showed the level of reporting to be only 11% of the infectious cases treated. The 1968 survey should determine the extent of the increase.

The questionnaire card requires no signature and replies of individual physicians will *not* be identified by name. Results of the survey will be published nationally by the sponsoring organizations.

Manual on Alcoholism

As proof of the popularity and timeliness of the *Manual on Alcoholism,* more than 10,000 copies have been distributed since its release late last October.

This 100-page publication, "intended to give physicians a brief outline of the major factors in the causes, diagnosis and treatment of alcoholism and the medical management of alcoholic patients," is available for 50 cents in the U. S., Possessions, Canada and Mexico.

Medical students, hospital interns and residents in these areas may obtain it for only 40 cents. The price in all other countries is 60 cents.

Requests should be directed to the American Medical Association, 535 North Dearborn, Chicago, Illinois 60610. To facilitate handling, orders should include payment and contain the code number, MH-3.

WALDO BRIGGS MOYERS
1900-1967

Waldo B. Moyers, MD, of University Park, Maryland, died on December 9, 1967 after a long illness.

"Pop" as he was affectionately known to his many friends and colleagues, enjoyed a long career of distinction and service to humanity. It was during his early years as a school teacher he realized his true vocation to be that of a physician. He entered the University of Maryland School of Medicine and after graduation, elected to practice in Mount Rainier where he stayed until shortly before his death.

"Pop" exemplified the physician at his best. He was compassionate and kind. He understood people, recognizing their frailties and their foibles. He was sympathetic to their problems and always listened with a friendly ear, ready to assist in any way he could.

Within the profession, he was counselor and a friend. He assisted immeasurably in the revitalization of the Faculty during the 1950's, recognizing the responsibility of the profession in serving the public through an organized and knowledgeable organization.

His extensive work in the fields of medical planning, problems of the aged, social services and public welfare brought plaudits from several of Maryland's governors.

But he did not confine his activities to medicine and the related fields. He was active in churchwork at St. Andrew's in College Park; and his interest in civic affairs led him to the position of president of the Rotary (1958-1959) and member of the board of the Suburban Trust Company. He was a member of the Terrapin Club of the University of Maryland, the Mason Lodge of Mooresfield of West Virginia; and the Columbia Country Club.

His medical distinctions included being a Fellow of the American College of Physicians; a Fellow of the American College of Cardiology; an Instructor in Clinical Medicine at Georgetown University Hospital; a Diplomate of the American Board of Internal Medicine; President of the staff at Prince Georges General Hospital, Cheverly; Chairman of the Medical Examining Board of Selective Services. Also, he served on the boards of the Prince Georges Tuberculosis Association and the first Mental Hygiene Demonstration Clinic. He was a Fellow of the American Geriatric Society; and served on the Executive Committee of the Medical and Chirurgical Faculty, as well as serving in many other capacities with the Faculty.

"Pop" was instrumental in the formation of the Prince Georges County Heart Association and served as its first president. He was also president of the Prince Georges County Medical Society.

He is survived by his wife, the former Elinor Corell, a son, Deal, of Richmond, Va., and two sisters, Mrs. Leonard Hollen and Mrs. Clifford Riddel, both of Bridgewater, Va.

Weariness "without cause"

Psychic tension with depressive symptomatology?

"For weeks I've done practically nothing and I'm always tired. I wake up tired and I go to bed tired. It's absurd. It's really absurd."

When the patient complains of fatigue, and you can find no organic cause, you recognize that it may serve her as a means of avoiding responsibilities or facing an emotional problem. It is, in effect, a psychological retreat behind a somatic cover of continuous fatigue —one of the many depressive symptoms often associated with psychic tension.

She needs counsel and reassurance, and perhaps a tranquilizer to attenuate excessive tension and help restore the capacity to cope. As an aid to successful management, consider the value of Valium® (diazepam). As psychic tension is eased by Valium therapy, secondary depressive symptoms too may subside. The patient feels more capable, therefore more hopeful; better able to handle situations of intense stress.

Before prescribing Valium (diazepam), consult complete product information; a summary follows:

Indications: Tension and anxiety states; somatic complaints which are concomitants of emotional factors; psychoneurotic states manifested by tension, anxiety, apprehension, fatigue, depressive symptoms or agitation; acute agitation, tremor, delirium tremens and hallucinosis due to acute alcohol withdrawal; adjunctively in: skeletal muscle spasm due to reflex spasm to local pathology, spasticity caused by upper motor neuron disorders; athetosis, stiff-man syndrome, convulsive disorders (not for sole therapy).

Contraindications: Known hypersensitivity to drug; children under 6 months of age; acute narrow angle glaucoma; may be used in patients with open angle glaucoma who are receiving appropriate therapy.

Warnings: Not of value in treatment of psychotic patients, and should not be employed in lieu of appropriate treatment. As with most CNS-acting drugs, caution patients against hazardous occupations requiring complete mental alertness (*e.g.*, operating machinery, driving). When used adjunctively in convulsive disorders, possibility of increase in frequency and/or severity of grand mal seizures may require increase in dosage of standard anticonvulsant medication; abrupt withdrawal in such cases may also be associated with temporary increase in frequency and/or severity of seizures. Advise patients against simultaneous ingestion of alcohol and other CNS depressants. Withdrawal symptoms (similar to those with barbiturates and alcohol) have occurred following abrupt discontinuance. Keep addiction-prone individuals (such as drug addicts or alcoholics) under careful surveillance because of their predisposition to habituation and dependence. Use of any drug in pregnancy, lactation or in women of childbearing age requires that potential benefit be weighed against possible hazard.

Precautions: If combined with other psychotropics or anticonvulsants, carefully consider individual pharmacologic effects—particularly with known compounds which may potentiate action of Valium, such as phenothiazines, narcotics, barbiturates, MAO inhibitors and other antidepressants. Employ usual precautions in the severely depressed or in those with latent depression; suicidal tendencies may be present and protective measures necessary. Observe usual precautions in impaired renal or hepatic function. Limit dosage to smallest effective amount in elderly and debilitated to preclude ataxia or oversedation (initially 2 to 2½ mg once or twice daily, increasing gradually as needed or tolerated).

Adverse Reactions: Side effects most commonly reported: drowsiness, fatigue and ataxia. Infrequently encountered: confusion, constipation, depression, diplopia, dysarthria, headache, hypotension, incontinence, jaundice, changes in libido, nausea, changes in salivation, skin rash, slurred speech, tremor, urinary retention, vertigo and blurred vision. Paradoxical reactions such as acute hyperexcited states, anxiety, hallucinations, increased muscle spasticity, insomnia, rage, sleep disturbances and stimulation have been reported; should these occur, use of the drug should be discontinued. Because of isolated reports of neutropenia and jaundice, periodic blood counts and liver function tests are advisable during long-term therapy. Minor changes in EEG patterns (low-voltage fast activity) observed during and after therapy and are of no known significance.

Dosage: Individualize for maximum beneficial effect. *Adults:* Tension, anxiety and psychoneurotic states, 2 to 10 mg b.i.d. to q.i.d.; alcoholism, 10 mg t.i.d. or q.i.d. in first 24 hours, then 5 mg t.i.d. or q.i.d. as needed; adjunctively in skeletal muscle spasm, 2 to 10 mg t.i.d. or q.i.d.; adjunctively in convulsive disorders, 2 to 10 mg b.i.d. to q.i.d. *Geriatric or debilitated patients:* 2 to 2½ mg, 1 or 2 times daily initially, increasing as needed and tolerated. (See **Precautions.**) *Children:* 1 to 2½ mg t.i.d. or q.i.d. initially, increasing as needed and tolerated (not for use under 6 months).

Supplied: Valium® (diazepam) Tablets, 2 mg, 5 mg, and 10 mg; bottles of 50, 100 and 500.

Dilantin®
(diphenylhydantoin)

PARKE-DAVIS

In untold thousands of epileptic patients... Dilantin has been, and continues to be, the bedrock of therapy.

DILANTIN is useful in the treatment of grand mal epilepsy and certain other convulsive states. Its use will prevent or greatly reduce the incidence and severity of convulsive seizures in a substantial percentage of epileptic patients, without the hypnotic and narcotizing effects of many anticonvulsant drugs.

PRECAUTIONS: Periodic examination of the blood is advisable. Nystagmus in combination with diplopia and ataxia indicates dosage should be reduced. The possibility of toxic effects during pregnancy has not been explored. ADVERSE REACTIONS: Allergic phenomena such as polyarthropathy, fever, skin eruptions, and acute generalized morbilliform eruptions with or without fever. Rarely, dermatitis goes on to exfoliation with hepatitis, and further dosage is contraindicated. Gingival hypertrophy, hirsutism, and excessive motor activity are occasionally encountered. During initial treatment, side effects may include gastric distress, nausea, weight loss, nervousness, sleeplessness, feeling of unsteadiness. Macrocytosis, megaloblastic anemia, leukopenia, granulocytopenia, thrombocytopenia, pancytopenia, agranulocytosis, and aplastic anemia have been reported. Nystagmus, lymphadenopathy, lupus erythematosus, erythema multiforme (Stevens-Johnson syndrome), and a syndrome resembling infectious mononucleosis with jaundice have occurred.

DILANTIN is supplied in several forms including Kapseals® containing 0.1 Gm. and 0.03 Gm. diphenylhydantoin sodium.

Parke, Davis & Company, Detroit, Michigan 48232

The color combinations of the banded capsules are Parke-Davis trademarks. The orange-banded white capsule identifies Parke-Davis 0.1 Gm. diphenylhydantoin sodium; the pink-banded white capsule 0.03 Gm. diphenylhydantoin sodium.

PARKE-DAVIS 015R67

Lutrexin®

HW&D BRAND OF LUTUTRIN

3000 UNIT TABLETS

IN THE TREATMENT OF FUNCTIONAL DYSMENORRHEA AND SELECTED CASES OF PREMATURE LABOR AND 2ND AND 3RD TRIMESTER THREATENED ABORTION

- LUTREXIN, the non-steroid "uterine relaxing factor" has been found to be useful by many clinicians in controlling abnormal uterine activity.
- Literature on indications and dosage available on request.
- No side effects have been reported, even when massive doses (25 tablets per day) were administered.
- Supplied in bottles of twenty-five 3,000 unit tablets.

(In vivo measurement of Lutrexin on contracting uterine muscle of the guinea pig.)

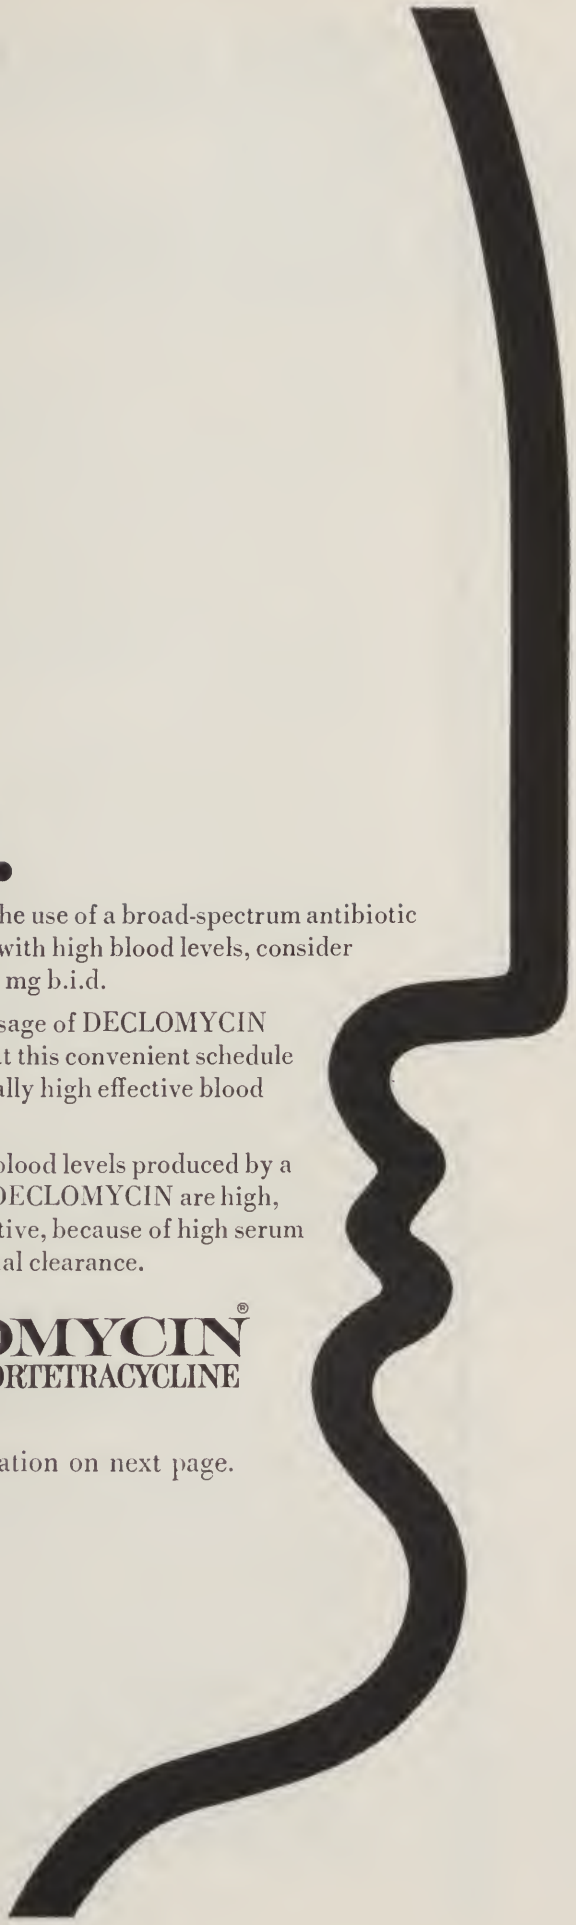
b.i.d.

If your objective in the use of a broad-spectrum antibiotic is prolonged action, with high blood levels, consider DECLOMYCIN 300 mg b.i.d.



The maintenance dosage of DECLOMYCIN 300 mg can be kept at this convenient schedule because of its unusually high effective blood and tissue levels.

In clinical practice, blood levels produced by a therapeutic dose of DECLOMYCIN are high, prolonged, and effective, because of high serum binding and slow renal clearance.

DECLOMYCIN®
DEMETHYLCHLORTETRACYCLINE

Lederle

Prescribing information on next page.

DECLOMYCIN®
DEMETHYLCHLORTETRACYCLINE
b.i.d.

DECLOMYCIN Demethylchlortetracycline should be equally or more effective therapeutically than other tetracyclines when the offending organisms are tetracycline-sensitive.

Contraindication: History of hypersensitivity to demethylchlortetracycline.

Warning—In renal impairment, usual doses may lead to excessive accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated, and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort. Necessary subsequent courses of treatment with tetracyclines should be carefully observed.

Precautions—Overgrowth of nonsusceptible organisms may occur. Constant observation is essential. If new infections appear, appropriate measures should be taken. In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment.

Side Effects—Gastrointestinal system—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. Skin—maculopapular and erythematous rashes; a rare case of exfoliative dermatitis has been reported. Photosensitivity; onycholysis and discoloration of the nails (rare). Kidney—rise in BUN, apparently dose related. Transient increase in urinary output, sometimes accompanied by thirst (rare). Hypersensitivity reactions—urticaria, angioneurotic edema, anaphylaxis. Teeth—dental staining (yellow-brown) in children of mothers given this drug during the latter half of pregnancy, and in children given the drug during the neonatal period, infancy and early childhood. Enamel hypoplasia has been seen in a few children. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy.

Average Adult Daily Dosage: 150 mg q.i.d. or 300 mg b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products. Treatment of streptococcal infections should continue for 10 days, even though symptoms have subsided.

In the treatment of syphilis a dosage schedule of a total of 12 to 18 Gm given in equally divided doses over a period of 10 to 15 days should be followed. Close follow-up observation of the patient is recommended, including appropriate laboratory tests, since demethylchlortetracycline has not had adequate evaluation in all stages of syphilis. Spinal fluid examination should be included as part of this follow-up.

Acute gonococcal anterior urethritis in males has been treated effectively with a single dose of 600-900 mg of DECLOMYCIN Demethylchlortetracycline. Individuals unable to tolerate large single doses due to gastrointestinal side effects may be treated with 150 mg every 6 hours for a minimum of 4 doses or 300 mg every 12 hours for a minimum of 2 doses. Females should be treated with a dosage of 150 mg every 6 hours or 300 mg every 12 hours until a cure is effected.

Primary Atypical Pneumonia (Eaton Agent): The average adult daily dosage is 900 mg in 3 divided doses for six days.

Don't let monilia cut broad-spectrum therapy short...

start with Tetrex-F®

tetracycline phosphate complex-nystatin

Use of broad-spectrum antibiotics can cause fungal overgrowth in the alimentary tract... and give rise to symptoms so troublesome that therapy must be prematurely stopped. Tetrex-F (tetracycline phosphate complex-nystatin) helps you circumvent this problem.

The nystatin can prevent overgrowth of monilia; the phosphate complex delivers tetracycline to the blood rapidly. Side effects are infrequent.

High-Risk Patients

Tetrex-F (tetracycline phosphate complex-nystatin) is especially useful in patients most susceptible to fungal overgrowth during tetracycline therapy: (1) the elderly or debilitated, (2) young children, (3) the diabetic, (4) those on long-term tetracycline therapy, (5) those on steroid therapy, (6) those who have had moniliasis before, and (7) pregnant patients with a history of monilial vaginitis.

When you start with economical Tetrex-F (tetracycline phosphate complex-nystatin), you can complete the full course of broad-spectrum therapy with less chance of losing control elsewhere. A good start for a healthy finish.

PRESCRIBING INFORMATION. For complete information consult Official Package Circular. *Indications:* Infections of respiratory, gastrointestinal and genitourinary tracts and skin and soft tissues due to tetracycline-sensitive organisms, in patients with increased susceptibility to monilial infections. *Contraindications:* The drug is contraindicated in patients hypersensitive to its components. *Warnings:* Photodynamic reactions have been produced by tetracyclines. Natural and artificial sunlight should be avoided during therapy. Stop treatment if skin discomfort occurs. With renal impairment, systemic accumulation and hepatotoxicity may occur. In this situation, lower doses should be used. Tooth staining and enamel hypoplasia may be induced during tooth development (last trimester of pregnancy, neonatal period and childhood). *Precautions:* Bacterial superinfections may occur. Infants may develop increased intracranial pressure with bulging fontanels. In gonorrheal therapy, serologic tests for syphilis should be conducted initially and monthly for 3 months. *Adverse Reactions:* Glossitis, stomatitis, nausea, diarrhea, flatulence, proctitis, vaginitis, dermatitis, and allergic reactions may occur. *Usual Adult Dosage:* 1 capsule q.i.d. Continue for 10 days in Beta-hemolytic streptococcal infections. Administer one hour before or two hours after meals. *Supplied:* Capsules, bottles of 16 and 100. Each capsule contains tetracycline phosphate complex equivalent to 250 mg. tetracycline HCl activity and 250,000 units of nystatin. For Oral Suspension, 125 mg. tetracycline and 125,000 u. nystatin/5 ml., 60 ml. bottles.

SEMIANNUAL MEETING RESOLUTIONS

Resolutions for consideration at the Faculty's Semiannual session on Friday, September 6, 1968, in Ocean City, Md., must be received in the Faculty office BEFORE FRIDAY, JULY 12, 1968.

No date has been set for the meeting of the Reference Committee, but all members will be notified of the date and resolutions to be considered. Such notices will be mailed as promptly as possible after July 12.

NEWS NOTES

New Diplomates of the American Board of Surgery include Manuel Sanchez, M.D., of Baltimore; and Wallace H.Sadowsky, M.D., of Havre de Grace.

Art H. Panayis, M.D., has opened his office for the practice of Obstetrics and Gynecology in Ellicott City.

Leo H. Bartemeier, M.D., Baltimore, is representing the American Medical Association at the World Federation of Mental Health meeting in London, England, August 12-17.

New Fellows of the American Society of Anesthesiologists are: Helmut F. Cascorbi, M.D., of Baltimore; Joseph David Lee, M.D., of Silver Spring; and Sergei L. Snegireff, M.D., of Bethesda.

NEW OFFICERS

Newly elected officers of the Maryland Ophthalmological Society include: Irvin P. Pollack, M.D., President; David M. Paton, M.D., Vice-president; Robert Sandler, M.D., Secretary-Treasurer.

BANK CHARGE CARDS

Because several queries have been received in the Faculty Office with respect to use of Bank Charge Cards by patients for services rendered to them, members are reminded that the use of such cards is considered unethical.

Full details on this and similar ethical rulings may be obtained from the Faculty office.

MEDICAL PRACTICE ACT REVISIONS

The report of the Ad Hoc Committee to Consider Changes in the Medical Practice Act was presented to the Faculty's House of Delegates meeting in April.

No action was needed or taken at that time, pending receipt of comments from individual members, Delegates, Components and others. Copies can be obtained through the Faculty office.

MEDICAL

PRACTICE ACT

REVISIONS

(continued)

Basically, there are few substantive changes and these involved only the following points;

1. Deletion of specific subjects spelled out in the law in which examinations should be given. This will be established by regulation of the Board, making it more flexible so that changes can be made as medical school curricula change.

2. Provides for the issuance of a Temporary Permit to practice medicine for the purpose of post-graduate teaching.

3. Deletes the fee for examination, secrecy of the examinee's names, school of graduation, etc., the form of license, all of which will be established by the Board.

4. Deletion of the requirement that a license be filed with the clerk of the circuit court in which the physician resides.

5. Deletion of the statement as to what constitutes advertising. The power to determine this in regulation form has been given to the Board.

6. No changes were made in various sections dealing with:

(a) Commission on Medical Discipline, enacted at the 1968 General Assembly.

(b) Transplantation of organs section, enacted at the 1968 General Assembly.

(c) Abortion sections, enacted at the 1968 General Assembly.

(d) Parental consent section, enacted at the 1967 General Assembly.

Comments from individual members, Delegates, Officers and Component Societies are solicited prior to the Semiannual Faculty meeting, when, if approved, it will be submitted to the Legislative Council for its consideration and, hopefully, passage at the 1969 Legislative Session.

Newly elected to membership on the Blue Shield Board of Trustees is George D. Edwards, M.D., Towson.

BLUE SHIELD ELECTIONS

Officers of this group are: J. Sheldon Eastland, M.D., Baltimore, President; Charles F. O'Donnell, M.D., Towson, Vice-President; F. Ford Loker, M.D., Baltimore, Secretary; and Mr. F. Edward Rugemer, Treasurer.

AMA BYLAWS

Chapter VI. Meetings-Section 2. Registration (A) Members. A Member's Section registration shall correspond with his specialty or General Practice status as designated by him for classification in the American Medical Association Directory. To be accepted for Section registration purposes, a member of a Section who desires to change his registration from one Section to another because of a change in his specialty, shall be required to inform the Headquarters of The American Medical Association by written notice of this intention at least sixty days in advance of the Annual Convention.

Chapter VII. Sections-Section 7. Participation in Business Only active members registered in accordance with Chapter VI, Section 2 (A) shall have the right to participate in the business deliberation of a section.

PLEASE NOTE

An Active physician member may not change his Section registration for voting purposes from one Section to another Section, unless written notice of a change in his specialty has been given the AMA Headquarters at least 60 days (by April 16, 1968) in advance of the opening day of the Annual Convention.

Upon completion of an Active Member's Registration at the AMA Registration Desk, members will not be permitted to switch from one Section registration to another Section registration during the entire period that the AMA Annual Convention is in session.

However, all members are encouraged to attend any and all of the Scientific Section programs. Such attendance has no direct connection with the Section in which an Active Member may wish to be qualified to vote.

ADVANCE REGISTRATION INFORMATION

☐ **GENERAL REGISTRATION ONLY**

Just fill in the coupon at the left. (No Fee)

(This form must be returned before June 1, 1968 to receive your Advance Registration Identification Card. Your card will be sent to you on June 6 unless you request an earlier mailing date).

☐ **GENERAL REGISTRATION PLUS RESERVATIONS FOR SCIENTIFIC AWARDS DINNER**

Reception and Dinner in honor of the Scientific Award Winners, Wednesday, June 19, 1968; Reception, 6:30 p.m. and Dinner, 7:30 p.m.

Dinner Tickets are $10.00 each, payable in advance.

My remittance of $_____ is enclosed.

Reservations are limited to approximately 500 people.

Advance Reservations may be made until June 3, 1968. After this date, tickets may be purchased in San Francisco.

In accordance with the AMA Bylaws, I hold active membership in the AMA and I wish to vote in the Scientific Section I have checked:

- ☐ Allergy
- ☐ Anesthesiology
- ☐ Colon and Rectal Surgery
- ☐ Dermatology
- ☐ Diseases of the Chest
- ☐ Experimental Medicine and Therapeutics
- ☐ Gastroenterology
- ☐ General Practice
- ☐ General Surgery
- ☐ Internal Medicine
- ☐ Laryngology, Otology and Rhinology
- ☐ Military Medicine
- ☐ Nervous and Mental Diseases
- ☐ Obstetrics and Gynecology
- ☐ Ophthalmology
- ☐ Orthopedic Surgery
- ☐ Pathology and Physiology
- ☐ Pediatrics
- ☐ Physical Medicine
- ☐ Preventive Medicine
- ☐ Radiology
- ☐ Urology

(Only Active Members Will Be Permitted To Vote)

The American Medical Association stated that the regional medical programs had showed good progress in the early stages but urged that Congress order an early evaluation by a non-government agency.

The AMA position was outlined by Bland W. Cannon, MD, of Memphis, Tenn., a member of the Association Council on Medical Education, in testimony before the House Subcommittee on Public Health and Welfare. The subcommittee was considering Administration legislation to extend the regional medical program law for five years.

Subcommittee members reacted favorably to an AMA recommendation that the extension be for only three years. Some of the congressmen also indicated opposition to a recommendation by Michael DeBakey, MD, of Houston, Texas, that appropriations for the regional medical programs be increased sharply.

"We view with favor the early progress of RMP, its ability to build on existing patterns of medical care (sometimes adding new features or changing old ones as local demands and resources make possible) and the local flexibility which allows the program to make a real contribution to the health care of our nation," Dr. Cannon said. "At the same time, we recognize that the concept of the Regional Medical Program is still in its very early stage of existence and that it is difficult to fully appraise the program. We do not know, for example, how much this program adds to the stress on an already overtaxed supply of available medical manpower.

"There is some concern that the proliferation of federal health programs substantially contributes to the rise in health care costs. For this reason, we are pleased that H.R. 15758 provides for an evaluation of the program. We would suggest, however, that the evaluation begin July 1, 1968, rather than July 1, 1969, since 'evaluation' should be an integral part of the planning. We also suggest that the subcommittee consider further amending Section 102 to provide that the evaluation shall be made by a non-government agency. . . .

"We recommend that the subcommittee delete the open-end authorization for funds for the four fiscal years ending after June 30, 1969. In view of the fact that we are still dealing with a relatively untried program, we believe it would be wise to limit the authorization to such sums as this subcommittee may determine to be reasonable, rather than to provide 'such sums as may be necessary for the next four fiscal years.' "

Henry Brill, MD, of Brentwood, N.Y., chairman of the AMA's Committee on Alcoholism and Drug Dependence, said that the AMA supported the part of the legislation authorizing federal grant for construction of facilities for a new program for alcoholic and narcotic addict rehabilitation.

"However," he said, "we have long felt that funds for staffing and operation are properly the responsibility of the community, once the major burden of construction has been met with federal assistance."

Reorganization of HEW

Wilbur J. Cohen, a key proponent of medicare, was named by President Johnson to succeed John W. Gardner as Secretary of Health, Education and Welfare.

Mr. Cohen, now 54, started with the federal government in the early thirties and helped draft the social security program. Recognized by Congress as an expert on social security, he was the leading architect of medicare and played a prominent role in getting Congressional approval of the program.

He had been Undersecretary of HEW since June, 1965. For the previous four years, he had been Assistant Secretary of HEW.

At a news conference following his appointment to the top HEW post, Cohen foresaw health care accounting for as much as 50% of total welfare costs. He urged that voluntary private health insurance be improved. But he said he did not believe private programs could be improved sufficiently to eliminate the need for government help in dealing with the health care needs of low income groups and the disabled.

"Medicare and medicaid have had some impact on higher medical costs," Cohen said. "But I think doctors' costs are going to taper off. Hospital costs are going to continue to rise but there is a problem of antiquated and inefficient methods. This can be changed."

Soon after Gardner's resignation becomes effective, Cohen announced major steps in the reorganization of HEW's health activities. Unified

direction of HEW's major health agencies was assigned to Philip R. Lee, MD, Assistant Secretary for Health and Scientific Affairs. William H. Stewart, MD, Surgeon General of the Public Health Service, was named principal deputy to Dr. Lee.

Dr. Lee was given direct authority over the Public Health Service and the Food and Drug Administration. Dr. Stewart and Food and Drug Commissioner James L. Goddard, MD, will report directly to the Assistant Secretary, while continuing their present administrative duties.

Dr. Lee's responsibility also was expanded to include overall health policy direction and coordination of other health programs, including medicare, medicaid and the health activities of the children's bureau.

In his 1968 message to Congress, President Johnson had directed the HEW secretary to submit "a modern plan of organization to achieve the most efficient and economical operation of the health programs of the federal government."

"In the past four years," Cohen said, "31 major new laws have been enacted that increase the Department's authority, responsibility and appropriations in the field of health.

"The total federal investment in health has grown from approximately $3 billion in 1960 to nearly $14 billion in 1968, and $16 billion proposed in 1969. Because of new programs, like medicare and medicaid, the HEW health investment alone has more than tripled in the past three years, from $2.6 billion in 1966 to $9.6 billion this fiscal year, and $10.9 billion proposed for 1969."

In a reassignment of agency responsibilities, the National Institutes of Health was expanded to include the present NIH, the Bureau of Health Manpower and the National Library of Medicine. The Health Services and Mental Health Administration was set up with responsibility for all other functions previously assigned to the Public Health Service. These two new agencies, along with the present Food and Drug Administration now make up an expanded and more comprehensive Public Health Service.

James A. Shannon, MD, Director of the National Institutes of Health, was named Director of the newly constituted NIH. Dr. Robert Q. Marston, Director of the Division of Regional Medical Programs, was named Acting Administrator of the Health Services and Mental Health Administration. Dr. Goddard continues as Commissioner of Food and Drugs. The heads of these three agencies will report directly to Dr. Lee under the new organizational setup.

Justice Department Assumes Drug Control

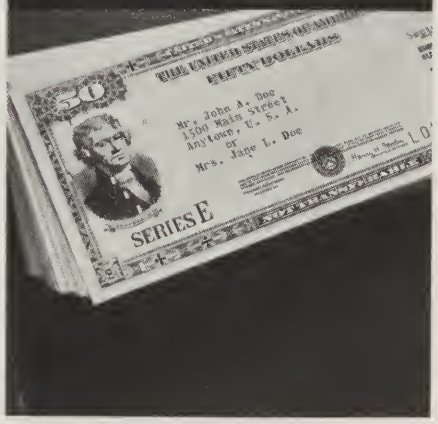
On April 7, Presidential Reorganization Plan No. 1 became effective, creating in the Department of Justice, a new bureau of Narcotics and Dangerous Drugs.

The new bureau assumes the responsibility for the drug enforcement functions previously delegated to the Bureau of Narcotics and the Bureau of Drug Abuse Control. The reorganization plan was originally proposed by the President in his special message on crime to the Congress on February 7, at which time he said that the new bureau would ". . . bring to the American people the most efficient and effective federal enforcement machinery we can devise."

The Bureau of Narcotics and Dangerous Drugs also assumes the educational functions previously delegated to the Bureau of Narcotics and the Bureau of Drug Abuse Control.

To fight TB- find it first!

Make tuberculin testing routine with every physical examination.



TUBERCULIN,TINE TEST
(Rosenthal)

Side effects are possible but rare: vesiculation, ulceration, or necrosis at test site. Contraindications: none, but use with caution in active tuberculosis. Available in 5's and 25's.

Social Security—Benefits & Tax Climb

Congress has passed a compromise plan to add $3.6 billion per year to social security benefits for 24 million people. The benefits are somewhat less than asked for by the administration and approved by the Senate. So is the added tax burden.

Benefit increases—

effective in March, 1968 amount to 13% across the board. The minimum benefit for a retired worker will increase to $55 from $44. And a retired worker may earn $1,680 without forfeiting any of his benefits.

Taxes will be increased—

in January 1968 only for those earning between $6,600, the current maximum wage base, and $7,800, the new maximum wage base. The tax rate for next year will remain 4.4% each on employees and employers but the increase in the wage base raises their maximum tax to $343.20. Currently, maximum tax paid by each is $290.40.

The tax rate is set to go to 4.8% in 1969 so the maximum tax will rise to $374.40 for both 1969 and 1970. It will continue to increase every few years until it reaches $460.20 in 1987 (see chart). All taxes are matched by employers.

Self-employed persons—

will pay about 50% more than other workers amounting to a maximum tax in 1968 to a few cents short of $500.00. By 1973, self-employed persons would be taxed up to $596.70 for their Social Security.

Medicare patients—

now limited to 90 days of hospital care for each "spell of illness," will get an added "lifetime reserve" of 60 days of hospitalization of which they will pay $20.00 per day.

Medicaid—

which provides free medical care in whole or in part to families earning below a given income level established by each state, will now have a federal income standard applied which will affect the federal contributions made to each state. For example, New York provides Medicaid for a family of four with a net income of less than $6,000. The new rule would eventually limit federal participation to only those families earning less than $3,900. In California the income ceiling for a family of four would be cut from $3,900 to $3,100.

OLD AND NEW SOCIAL SECURITY TAX SCHEDULE

YEAR	Tax Rate		Maximum Tax for Employer & Employee		Maximum tax Per Job
	Old Law	New Law	Old Law	New Law	New Law
Now	4.4%	..	290.40	..	..
1968	4.4	4.4%	290.40	343.20	686.40
1969-70	4.9	4.8	323.40	374.40	748.80
1971-72	4.9	5.2	323.40	405.60	811.20
1973-75	5.4	5.65	356.40	440.70	881.40
1976-79	5.45	5.7	359.70	444.60	889.20
1980-86	5.55	5.8	366.30	452.40	904.80
1987-	5.65	5.9	372.90	460.20	920.40

Note: Self-employed persons pay about 50% more than employees

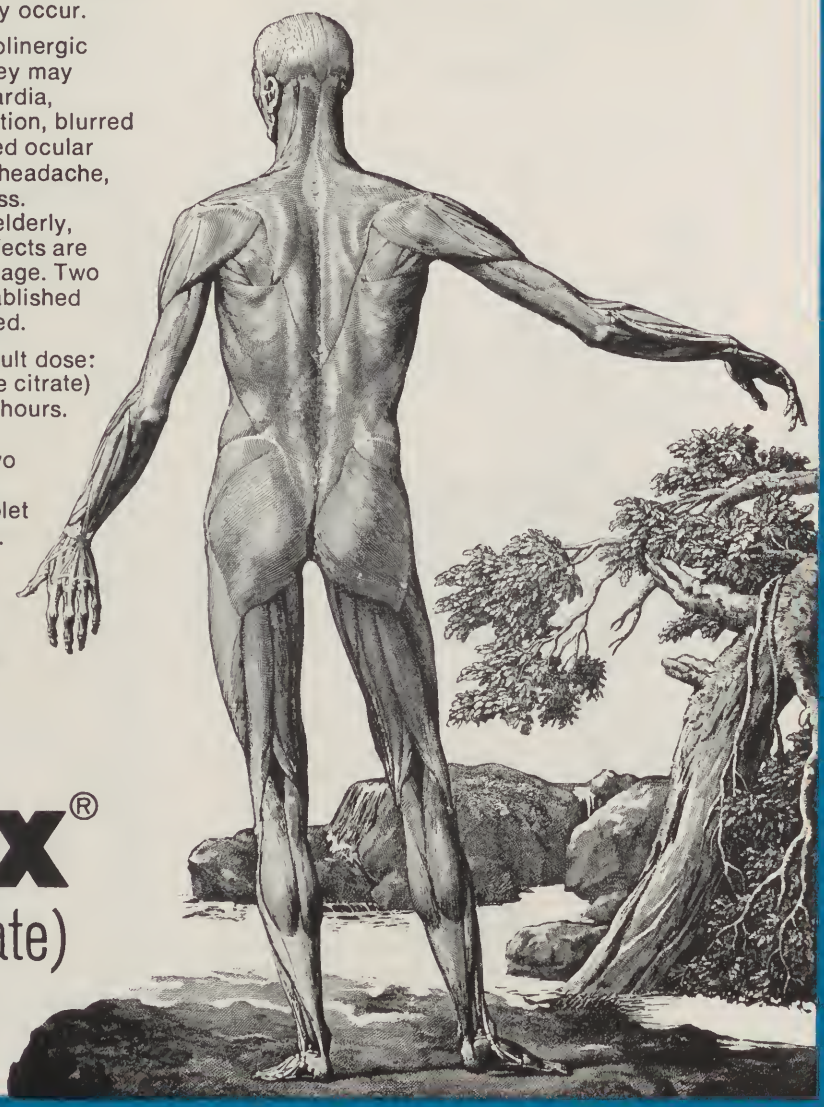
The muscle relaxant that works before you write a prescription

Relieve painful skeletal muscle spasm in your office in minutes with a single 2 cc. injection of NORFLEX. Then, for sustained relief, write a prescription for NORFLEX tablets, 1 tablet b.i.d.

CONTRAINDICATIONS: Due to its anticholinergic action, NORFLEX should not be used in patients with glaucoma, pyloric or duodenal obstruction, stenosing peptic ulcer, prostatic hypertrophy or obstruction at the bladder neck, cardiospasm (megaesophagus) and myasthenia gravis. Use with caution in patients with tachycardia. Do not use propoxyphene (Darvon®) concurrently.



WARNING: Transient lightheadedness or dizziness following NORFLEX-INJECTABLE may occur.

SIDE EFFECTS: Due mainly to anticholinergic action and usually at high dosage. They may include dryness of the mouth, tachycardia, palpitation, urinary hesitancy or retention, blurred vision, dilatation of the pupil, increased ocular tension, weakness, nausea, vomiting, headache, dizziness, constipation, and drowsiness. Infrequently, mental confusion in the elderly, urticaria or other dermatoses. Side effects are usually eliminated by reduction in dosage. Two cases of aplastic anemia, with no established causal relationship, have been reported.

DOSAGE: **INJECTABLE** — Average adult dose: one ampul, 2 cc. (60 mg. orphenadrine citrate) I.M. or I.V. May be repeated every 12 hours. Relief may be maintained with one NORFLEX tablet b.i.d. **TABLETS** — Two tablets per day for adults, one in the morning, one in the evening. Each tablet contains 100 mg. orphenadrine citrate.

For full information, see Package Insert or P.D.R.

AMA Warns of Potential Hazards in

The American Medical Association recently issued a word of warning concerning commercially promoted "clubs" for weight losers.

"Since excess weight may be a symptom of illness, it is vital for any person who wants to lose weight to have a physical examination by his physician before participating in any of these so-called club programs," the AMA said.

Several such clubs are now in operation. They are frequently operated locally by a businessman who obtained a franchise from a national headquarters organization.

"The regimen and rapport of group 'workouts' that are being commercially promoted throughout the country may give the overweight person some moral support for his effort at weight reduction and little else," the AMA said. "The group approach may be satisfactory for the person who wants to lose a few pounds and can afford the fee charged by a club.

"The group approach that does not include a complete, preliminary physical examination and

ealth Club" Reducing Programs

medical supervision is definitely not satisfactory for the person who is significantly overweight, or who plans to lose 15% or more of his total weight. Significant weight reduction must be carried out under the supervision of a physician.

"There is in the overweight population a higher incidence of hypertension, cardiovascular and kidney diseases, disorders of the liver and gallbladder, and diabetes mellitus.

"Sudden loss of significant amounts of weight, or the requirement for an unusual amount of exercise, may be hazardous for the patient with any of these conditions.

"Adequate treatment of obesity (significant overweight) is often a more complex matter than diet and exercise, the usual club regimen. While simple over-eating and under-exercising may be a cause of obesity, significant overweight frequently has a genetic, metabolic or psychological component which requires medical diagnosis and treatment. Because there is no single cause of obesity, there is no single proper treatment to correct it."

Weariness "without cause"

Psychic tension with depressive symptomatology?

"For weeks I've done practically nothing and I'm always tired. I wake up tired and I go to bed tired. It's really absurd."

When the patient complains of fatigue, and you can find no organic cause, you recognize that it may serve her as a means of avoiding responsibilities or facing an emotional problem. It is, in effect, a psychological retreat behind a somatic cover of continuous fatigue —one of the many depressive symptoms often associated with psychic tension.

She needs counsel and reassurance, and perhaps a tranquilizer to attenuate excessive tension and help restore the capacity to cope. As an aid to successful management, consider the value of Valium® (diazepam). As psychic tension is eased by Valium therapy, secondary depressive symptoms too may subside. The patient feels more capable, therefore more hopeful; better able to handle situations of intense stress.

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Tension and anxiety states; somatic complaints which are concomitants of emotional factors; psychoneurotic states manifested by tension, anxiety, apprehension, fatigue, depressive symptoms or agitation; acute agitation, tremor, delirium tremens and hallucinosis due to acute alcohol withdrawal; adjunctively in: skeletal muscle spasm due to reflex spasm to local pathology, spasticity caused by upper motor neuron disorders; athetosis, stiff-man syndrome, convulsive disorders (not for sole therapy).

Contraindications: Known hypersensitivity to drug; children under 6 months of age; acute narrow angle glaucoma; may be used in patients with open angle glaucoma who are receiving appropriate therapy.

Warnings: Not of value in treatment of psychotic patients, and should not be employed in lieu of appropriate treatment. As with most CNS-acting drugs, caution patients against hazardous occupations requiring complete mental alertness (*e.g.*, operating machinery, driving). When used adjunctively in convulsive disorders, possibility of increase in frequency and/or severity of grand mal seizures may require increase in dosage of standard anticonvulsant medication; abrupt withdrawal in such cases may also be associated with temporary increase in frequency and/or severity of seizures. Advise patients against simultaneous ingestion of alcohol and other CNS depressants. Withdrawal symptoms (similar to those with barbiturates and alcohol) have occurred following abrupt discontinuance. Keep addiction-prone individuals (such as drug addicts or alcoholics) under careful surveillance because of their predisposition to habituation and dependence. Use of any drug in pregnancy, lactation or in women of childbearing age requires that potential benefit be weighed against possible hazard.

Precautions: If combined with other psychotropics or anticonvulsants, carefully consider individual pharmacologic effects —particularly with known compounds which may potentiate action of Valium, such as phenothiazines, narcotics, barbiturates, MAO inhibitors and other antidepressants. Employ usual precautions in the severely depressed or in those with latent depression; suicidal tendencies may be present and protective measures necessary. Observe usual precautions in impaired renal or hepatic function. Limit dosage to smallest effective amount in elderly and debilitated to preclude ataxia or oversedation (initially 2 to 2½ mg once or twice daily, increasing gradually as needed or tolerated).

Adverse Reactions: Side effects most commonly reported: drowsiness, fatigue and ataxia. Infrequently encountered: confusion, constipation, depression, diplopia, dysarthria, headache, hypotension, incontinence, jaundice, changes in libido, nausea, changes in salivation, skin rash, slurred speech, tremor, urinary retention, vertigo and blurred vision. Paradoxical reactions such as acute hyperexcited states, anxiety, hallucinations, increased muscle spasticity, insomnia, rage, sleep disturbances and stimulation have been reported; should these occur, use of the drug should be discontinued. Because of isolated reports of neutropenia and jaundice, periodic blood counts and liver function tests are advisable during long-term therapy. Minor changes in EEG patterns (low-voltage fast activity) observed during and after therapy and are of no known significance.

Dosage: Individualize for maximum beneficial effect. *Adults:* Tension, anxiety and psychoneurotic states, 2 to 10 mg b.i.d. to q.i.d.; alcoholism, 10 mg t.i.d. or q.i.d. in first 24 hours, then 5 mg t.i.d. or q.i.d. as needed; adjunctively in skeletal muscle spasm, 2 to 10 mg t.i.d. or q.i.d.; adjunctively in convulsive disorders, 2 to 10 mg b.i.d. to q.i.d. *Geriatric or debilitated patients:* 2 to 2½ mg, 1 or 2 times daily initially, increasing as needed and tolerated. (See **Precautions.**) *Children:* 1 to 2½ mg t.i.d. or q.i.d. initially, increasing as needed and tolerated (not for use under 6 months).

Supplied: Valium® (diazepam) Tablets, 2 mg, 5 mg, and 10 mg; bottles of 50, 100 and 500.

First Meeting of National Association of Medical Examiners Held

The National Association of Medical Examiners held its first annual meeting on February 21, 1968 in Chicago, where it elected officers, a Board of Directors and an Executive Committee and adopted a set of By-Laws for the organization.

The Association elected as its President Milton Helpern, MD, Chief Medical Examiner of New York City and one of the founders of the organization. Joseph W. Spelman, MD, Medical Examiner of Philadelphia, was elected Vice President and Leslie Lukash, MD, Medical Examiner of Nassau County, East Meadow, New York, was elected Secretary-Treasurer. All three officers will serve one-year terms.

The following were elected to three-year terms on the Executive Committee: Lester Adelson, MD, Pathologist and Chief Deputy Coroner, County of Cuyahoga, Cleveland, Ohio; John I. Coe, MD, Medical Examiner of Hennepin County, Minneapolis, Minn.; Daniel J. Condon, MD, Medical Examiner, Maricopa County, Phoenix, Arizona; Ali Z. Hameli, MD, Chief Medical Examiner, State of Delaware, Wilmington, Delaware; R. C. Henry, MD, Chief Medical Investigator, State of Oregon, Portland, Oregon; Joseph A. Jachimczyk, MD, Chief Medical Examiner, Harris County, Houston, Texas; and Charles P. Larson, MD, Director of Laboratories, Tacoma General Hospital, Tacoma, Washington.

Those elected to two-year terms on the Executive Committee were: Edwin Albano, MD, Chief Medical Examiner, Essex County, Newark, New Jersey; Richard Ford, MD, Medical Examiner, Southern Division of Suffolk County, Boston, Mass.; Alvin V. Majoska, MD, Chief Medical Examiner, City and County of Honolulu, Honolulu, Hawaii; Geoffrey T. Mann, MD, Chief Medical Examiner, Commonwealth of Virginia, Richmond, Va.; Charles S. Petty, MD, Professor of Pathology, University of Indiana School of Medicine, Indianapolis, Ind.; Sidney B. Weinberg, MD, Chief Medical Examiner, Suffolk County, Happauge, New York; and William C. Wilentz, MD, Chief Medical Examiner, Middlesex County, Perth Amboy, New Jersey.

The Association elected the following to the Executive Committee for one-year terms: Victoria A. Bradess, MD, Chief Medical Examiner, Westchester County, Valhalla, New York; Theodore I. Curphey, MD, recently-retired Chief Medical Examiner-Coroner, Los Angeles County, Los Angeles, California; Robert M. Greendyke, MD, Medical Examiner, Monroe County, Rochester, New York; Robert Hausman, MD, Chief Medical Examiner, Bexar County, San Antonio, Texas; Martin Hilfinger, MD, Chief Medical Examiner, Onondaga County, Syracuse, New York; Michael Luongo, MD, Medical Examiner, Northern Division, Suffolk County, Boston, Mass.; and T. C. Terrell, MD, Chief Medical Examiner, Tarrant County, Fort Worth, Texas. In future years all Executive Committee members will be elected for three-year terms, thus providing for a staggered system of elections.

Russell S. Fisher, MD, Chief Medical Examiner, State of Maryland, Baltimore, Maryland, was elected Chairman of the Executive Committee, a position that will be filled in future years by the immediate past president.

The Board of Directors will consist next year of the three officers and Drs. Fisher, Hausman, Larson and Majoska. The last three were named to the Board by the Executive Committee. In future years the Board will consist of the three officers, the immediate past president and three members of the Executive Committee. All members of the Board of Directors will serve one-year terms.

The meeting adopted the following aims and purposes as part of the By-Laws:

> To improve and make more effective the official investigation of sudden, suspicious and violent deaths under the medical examiner system; to strengthen the administration and operation of the medical examiner system; to assist in and encourage the establishment of the medical examiner system in areas where such a system is not now in effect; to establish, maintain and promote proper standards

for a model medical examiner system; to disseminate accurate information regarding the medical examiner system and its contributions to the administration of justice and the protection of the health of the community; to advance the professional interests of the medical examiners, including those relating to the administrative and career aspects of their work; to conduct studies, sponsor publications and undertake other activities and projects designed to assist medical examiners in improving the quality of their work; and to establish and maintain a code of ethics.

The Association plans to conduct a membership drive to obtain as many qualified members as possible.

Membership in NAME is open to all medical examiners, pathologists and other licensed physicians who have responsibilities in connection with the official investigation of sudden, suspicious and violent deaths.

Interested physicians are invited to write to the National Association of Medical Examiners, 520 First Avenue, New York, N. Y. 10016.

$20 Billion

Spent on Mental Illness in 1966 .

Despite steady improvement in treatment services, mental illness cost U. S. citizens more than $20 billion in 1966. Figures reported by Stanley F. Yolles, MD, Director of the National Institute of Mental Health, show that mental illness cost Americans an average of almost $48 each that year.

Commenting on the NIMH study, Wilbur J. Cohen, Secretary of the Department of Health, Education, and Welfare, which includes NIMH, said the costs would have been even higher had it not been for many improvements in mental health services across the country.

"One of the Department's major priorities is to increase knowledge and manpower and improve treatment services in mental health," Mr. Cohen said, "and our efforts are paying off as shown by the latest survey of the number of resident patients in State and County mental hospitals."

The Secretary added that last year saw the sharpest decrease in resident patients in such hospitals since the downward trend began 12 years ago. He cited a 26,000-patient decrease which amounts to 5.8% for the year.

"Latest statistics show that as of June 30, 1967, there were 426,009 resident patients in State and County mental hospitals; 133,000 less than 12 years ago," Mr. Cohen said.

"However, the tremendous waste of mental illness revealed by the 1966 NIMH study shows the need for continuing efforts at every level of government and by all citizens to help reduce further the cost of such illness," he added.

The NIMH study showed that the largest part of the $20 billion, $15.5 billion, was attributed to decreased productivity. This was defined to include loss of marketable output ($14.3 billion),

Despite Improvement in Treatment Services

loss of homemaking services ($970 million) and loss of unpaid work such as home maintenance and volunteer services ($240 million).

Treatment and prevention of mental illness cost almost $4 billion. This included more than $2.5 billion spent on inpatient care and slightly more than $1 billion spent on outpatient care. Federal, State, and local government spent $328 million on: development of mental health facilities ($121 million), training of mental health personnel ($94 million), and mental health research ($113 million).

The NIMH did not attempt to estimate the cost of excessive gambling, promiscuity, illegitimacy, alcoholism and drug addiction resulting from mental illness.

The NIMH found that $9 billion, or about half of the cost of mental illness, was borne by someone other than the patient or his immediate family. The general public paid all but $500 million of the $3.5 billion of the cost of treating the mentally ill in 1966. Three-fourths of this $3 billion was expended by local, State, and Federal government agencies. Private insurance carriers, private industry, and private philanthropy accounted for the remainder. The patients or their families bore $500 million of the cost, averaging nearly $200 per patient. NIMH calculated these costs based on 2.6 million persons treated for mental or emotional illness in 1966. One-fifth of these, or 500,000, were hospitalized on any given day during the year. Costs were conservatively estimated, so actual costs probably ran even higher.

Copies of the report are available from the Public Information Branch, National Institute of Mental Health, Chevy Chase, Maryland 20203.

RICHMOND, VIRGINIA 23217
Manufacturers of ethical pharmaceuticals since 1856

"When you're finished with baby,
maybe you can tell me what I can do about my extra pounds."

Get them while they're easily reversible.

Obesity doesn't happen suddenly. This insidious process has its beginning—and the chances of reversing it are better—during the *first 10 to 15 pounds of weight gain.* When a new dietary pattern must be established, consider the adjunctive use of BAMADEX SEQUELS. Combining the proven *anorexigenic* action of d-amphetamine with the *tranquilizing* effect of meprobamate, BAMADEX SEQUELS controls appetite throughout the day, usually with a single capsule daily.

Contraindications: Dextro-amphetamine sulfate: In hyperexcitability and in agitated prepsychotic states. Previous allergic or idiosyncratic reactions to meprobamate.
Precautions: Use with caution in patients hypersensitive to sympathomimetic compounds, who have coronary or cardiovascular disease, or are severely hypertensive.

Dextro-amphetamine sulfate: Excessive use by unstable individuals may result in psychological dependence.

Meprobamate: Careful supervision of dose and amounts prescribed is advised, especially for patients with known propensity for taking excessive quantities of drugs. Excessive and prolonged use in susceptible persons, e.g. alcoholics, former addicts, and other severe psychoneurotics, has been reported to result in dependence on the drug. Where excessive dosage has continued for weeks or months, reduce dosage gradually. Sudden withdrawal may precipitate recurrence of preexisting symptoms such as anxiety, anorexia, or insomnia; or withdrawal reactions such as vomiting, ataxia, tremors, muscle twitching and, rarely, epileptiform seizures. Should meprobamate cause drowsiness or visual disturbances, reduce dosage and avoid operation of motor vehicles, machinery or other activity requiring alertness. Effects of excessive alcohol consumption may be increased by meprobamate. Appropriate caution is recommended with patients prone to excessive drinking. In patients prone to both petit and grand mal epilepsy meprobamate may precipitate grand mal attacks. Prescribe cautiously and in small quantities to patients with suicidal tendencies.
Side Effects: Overstimulation of the central nervous system, jitteriness and insomnia or drowsiness. Dextro-amphetamine sulfate: Insomnia, excitability, and increased motor activity are common and ordinarily mild side effects. Confusion, anxiety, aggressiveness, increased libido, and hallucinations have also been observed, especially in mentally ill patients. Rebound fatigue and depression may follow central stimulation. Other effects may include dry mouth, anorexia, nausea, vomiting, diarrhea, and increased cardiovascular reactivity.

Meprobamate: Drowsiness may occur and can be associated with ataxia; the symptom can usually be controlled by decreasing the dose, or by concomitant administration of central stimulants. Allergic or idiosyncratic reactions: maculopapular rash, acute nonthrombocytopenic purpura with petechiae, ecchymoses, peripheral edema and fever, transient leukopenia. A case of fatal bullous dermatitis, following administration of meprobamate and prednisolone, has been reported. Hypersensitivity has produced fever, fainting spells, angioneurotic edema, bronchial spasms, hypotensive crises (1 fatal case), anuria, stomatitis, proctitis (1 case), anaphylaxis, agranulocytosis and thrombocytopenic purpura, and a fatal instance of aplastic anemia, but only when other drugs known to elicit these conditions were given concomitantly. Fast EEG activity, usually after excessive dosage. Impairment of visual accommodation. Massive overdosage may produce drowsiness, lethargy, stupor, ataxia, coma, shock, vasomotor and respiratory collapse.

Maryland Academy of General Practice
1968 Scientific Assembly and Annual Meeting

The Annual Meeting of the Maryland Academy of General Practice on May 25 and 26 is of particular importance to all those who believe in the concept of general or family practice. The officers of the Academy have made an exceptional effort to provide a program with broad appeal to the members. The symposium will deal with varied aspects of pediatric care—the very foundation of general practice.

In addition to an outstanding scientific program, a number of prominent persons in the educational and political field have been invited to the banquet. Only by a strong showing on the part of the membership by good attendance can one prove that *The Academy* is a viable and aggressive organization.

Some U.R.I. patients are more miserable than others.

That's why we make Novahistine® tablets in two different formulations.

And let you control the dosage.

Each Novahistine LP tablet contains phenylephrine hydrochloride, 25 mg.; and chlorpheniramine maleate, 4 mg.
Each Novahistine Singlet tablet contains phenylephrine hydrochloride, 40 mg.; chlorpheniramine maleate, 8 mg.; and acetaminophen, 500 mg.

With Novahistine LP tablets and Novahistine Singlet™ tablets you have the range and flexibility of decongestant dosage that lets you prescribe for the needs of the individual patient.
Novahistine LP tablets are most useful for relief of nasal congestion in patients without pain or fever. Novahistine Singlet tablets, which provide analgesic-antipyretic effect, as well as decongestant action, are indicated for upper respiratory infections accompanied by pain, aches and fever.
Whether you prescribe Novahistine LP or Novahistine Singlet, a total daily dose of 3 or 4 tablets will usually provide effective, continuous relief.
Use cautiously in patients with severe hypertension, diabetes mellitus, hyperthyroidism or urinary retention. Caution ambulatory patients that drowsiness may result.

DOW **PITMAN-MOORE** DIVISION OF THE DOW CHEMICAL COMPANY, INDIANAPOLIS

"Nothing else I've tried seems to work, so I decided to give you a crack at it."

The Bettmann Archive

A TRUST IS A TRUST. AND WE NEVER FORGET IT.

Never.

Our Trust Division is, first, a family business. Several thousand families rely on our competence in estate management for their security. That's a pretty basic and very vital reason for the professional competence and depth of the specialists on our Trust Department Staff.

But we're also in business with business. Corporate Pension and Profit-Sharing Plans are coming to us in ever-growing numbers. And for the same reasons that individuals do —their funds have to be protected and nurtured, too.

Both groups must feel that Mercantile offers them better protection and surer growth than any other bank in the Southeast. Perhaps they find it significant that Mercantile, one of the oldest banks in the South, was also the first to be fully automated. And today we manage in our Trust Department assets in excess of $2½ billion.

Very few banks in the country can match that statement.

Abbott Antihypertensive Building Blocks

A simplified approach to the practical management of hypertension

Enduron: (methyclothiazide) A basic building block for mild hypertensives

Excellent day-long Na^+ output, yet easy on the K^+

Enduron provides an excellent starting therapy. Your patient's sodium excretion is greatly enhanced. Yet potassium loss is low.

The therapeutic action is smooth, and persists for a full 24 hours. With Enduron you can prescribe convenient once-a-day dosage without skimping your patients on day-long thiazide effectiveness.

Of course, as with all thiazides, supplemental dietary potassium should also be considered.

Use Enduron as a basic therapy in patients with mild to moderate hypertension. A single 5-mg. tablet each day is ample in most cases.

Once a day, every day

ENDURON®

METHYCLOTHIAZIDE

MILD TO MODERATE TO SEVERE

See Brief Summary on final page of advertisement

Enduronyl: Its deserpidine component adds response in moderate hypertension

Less frequent rauwolfia side effects than with reserpine

When you wish to build further response, consider shifting to Enduronyl.

Enduronyl adds a building block of *deserpidine*. This is a purified rauwolfia alkaloid available only from Abbott. It adds good antihypertensive and tranquilizing activity. Yet its incidence of untoward effects, particularly lethargy and depression, is lower than with reserpine.

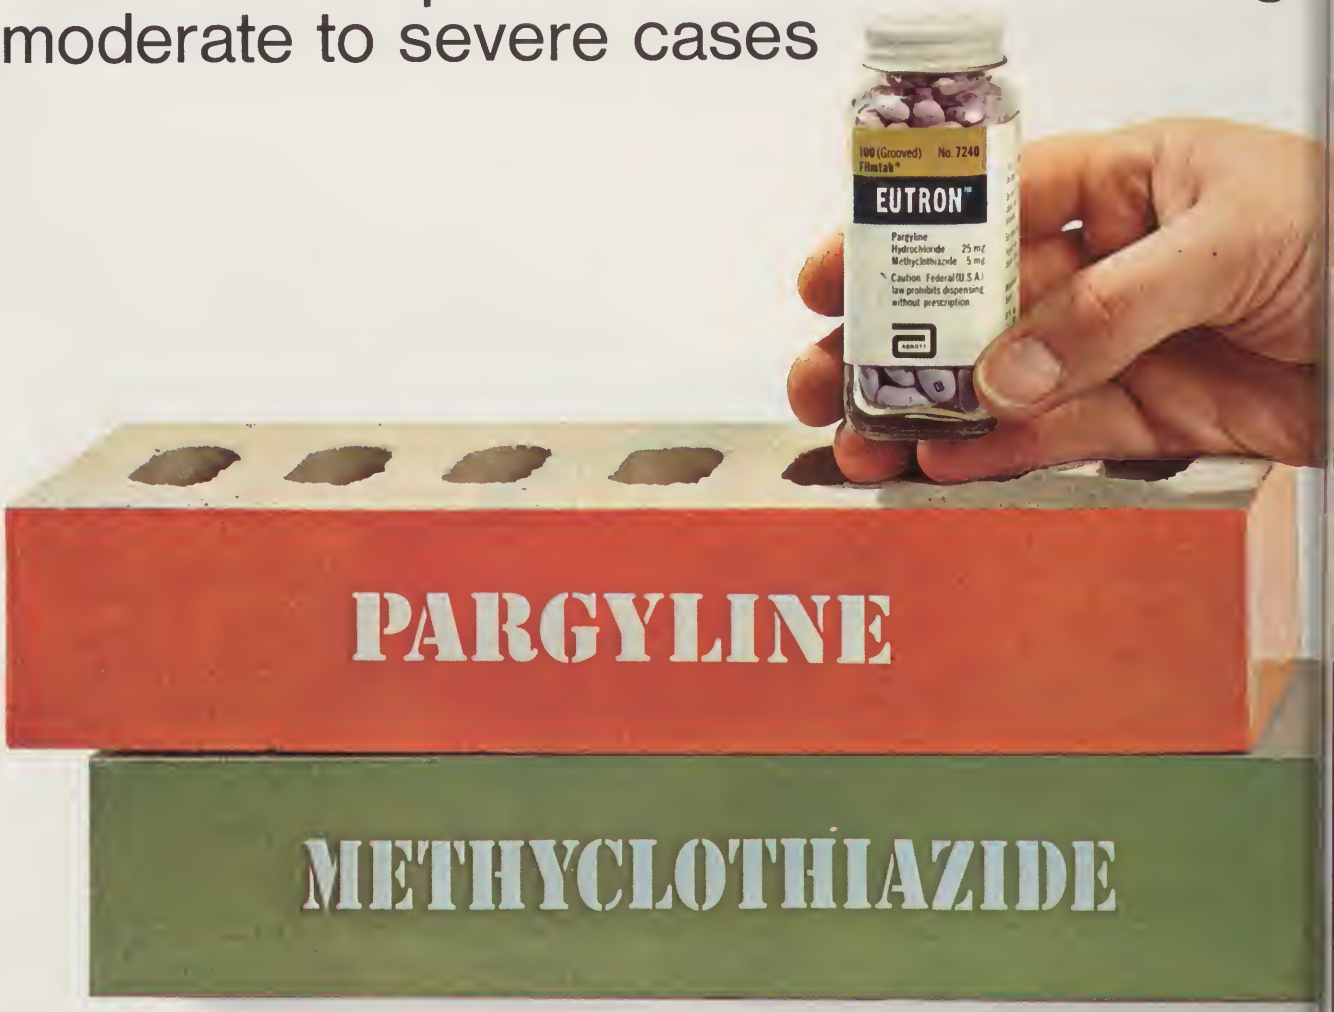
Enduronyl is available plain or Forte. The latter provides its variation where most helpful, by doubling the deserpidine.

Use Enduronyl for patients throughout the broad range of mild to moderately severe hypertension.

Once a day, every day

ENDURONYL®

METHYCLOTHIAZIDE 5 mg. with
DESERPIDINE 0.25 mg. or (FORTE) 0.5 mg.



MILD TO MODERATE TO SEVERE

See Brief Summary on final page of advertisement

801094

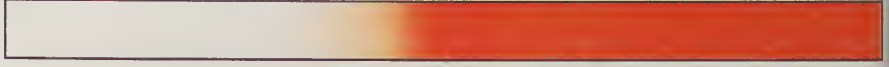
Eutron: A unique combination for handling moderate to severe cases

Affords almost uniform diastolic reduction in all body positions

Eutron lowers diastolic pressures nearly equally, whether your patient is standing up or lying down.

Thus, in clinical trials, average *standing* diastolic readings were reduced from 112 pre-treatment to 90 post-treatment; *sitting* from 115 to 95; and *recumbent* from 112 to 94.

Note that following Eutron, the diastolic reductions were nearly alike in all three body positions.



Use Eutron for managing your moderate to severe cases. Its building blocks enhance each other; hence lesser doses often suffice.

Once a day, every day

EUTRON™

PARGYLINE HYDROCHLORIDE 25 mg.
with METHYCLOTHIAZIDE 5 mg.

MILD TO MODERATE TO SEVERE

See Brief Summary on final page of advertisement

ENDURON® | ENDURONYL®

METHYCLOTHIAZIDE

Each tablet contains
Methyclothiazide 5 mg. with
Deserpidine 0.25 mg. or 0.5 mg.

Indications: Edema and mild to moderate hypertension (Enduron), and mild to moderately severe hypertension (Enduronyl). More potent agents, if added, can be given at reduced dosage.

Contraindications: Sensitivity to thiazides; severe renal disease (except nephrosis) or shutdown; severe hepatic disease or impending hepatic coma (hepatic coma due to hypokalemia has been reported in patients on thiazides). Do not use Enduronyl in severe mental depression, suicidal tendencies, active peptic ulcer, or ulcerative colitis.

Warnings: Consider possible sensitivity where there is history of allergy or asthma. If added potassium is indicated, dietary supplementation is recommended. Reserve enteric-coated potassium tablets for cautious use only when necessary, as they may induce serious or fatal small bowel lesions (stenosis with or without ulceration), cause obstruction, hemorrhage, and perforation often requiring surgery; discontinue them immediately if abdominal pain, distention, nausea, vomiting, or g.i. bleeding occurs. Neither Enduron nor Enduronyl contains added potassium.

Precautions: Use thiazides cautiously in severe renal dysfunction, impaired hepatic function or progressive liver disease; also in pregnancy (bone marrow depression, thrombocytopenia, and altered carbohydrate metabolism have been reported in certain newborn). In surgery, thiazides may reduce response to vasopressors, and increase response to tubocurarine. Antihypertensive response may be enhanced following sympathectomy. Watch for electrolyte imbalance (e.g., hyponatremia) in all patients. In hypokalemia (especially in digitalized patients) give supplemental potassium. In hypochloremic alkalosis, give supplemental chloride.

Use rauwolfias with caution in patients with history of peptic ulcer. Rauwolfias with anesthetics may produce hypotension and bradycardia. Discontinue Enduronyl two weeks before elective surgery. Consider vagal blocking agents during emergency surgery. In epilepsy, adjust anticonvulsant dosage. In electroshock, shorten stimulus strength and duration. In occasional patients with depressive tendencies, rauwolfias may precipitate severe mental depression that usually disappears when drug is stopped.

Adverse Reactions: Thiazide reaction include blood dyscrasias (thrombocytopenia with purpura, agranulocytosis, aplastic anemia); elevation of BUN, serum uric acid or blood sugar; anorexia, nausea, vomiting, diarrhea, headache, dizziness, paresthesia, weakness, skin rash, photosensitivity, jaundice, symtomatic gout, and pancreatitis. Cutaneous vasculitis in the elderly has been reported with other thiazides. Adverse effects with deserpidine are qualitatively similar to those with reserpine, but their incidence is lower. These include nasal stuffiness, abdominal cramps or diarrhea, nausea, headache, weight gain, reduced libido and potency, peptic ulcer aggravation, epistaxis, skin eruption, asthma in susceptible patients, electrolyte imbalance, excessive salivation, and a reversible Parkinson's syndrome. Excessive drowsiness, fatigue, weakness, and nightmares may signal mental depression. Thrombocytopenia, purpura, and a symptom manifested by dull sensorium, deafness, uveitis, glaucoma, and optic atrophy are rare allergic reactions to other rauwolfias. Hypotension from antihypertensive agents may precipitate angina attacks in susceptible individuals. Usually adverse reactions disappear when drug is withdrawn.

EUTRON™

Each tablet contains
Pargyline Hydrochloride 25 mg.
with Methyclothiazide 5 mg.

Indications—Moderate to severe hypertension.

Contraindications—Pheochromocytoma, paranoid schizophrenia, hyperthyroidism and advanced renal failure. Not recommended in malignant hypertension, children under 12, pregnant patients.

Do not use with: centrally or peripherally acting sympathomimetic drugs; foods high in tyramine (e.g., aged and natural cheeses); parenteral reserpine or guanethidine; imipramine, amitriptyline, desipramine, nortriptyline or their analogues; other monoamine oxidase inhibitors; methyldopa or dopamine; separate Eutron and these agents by two weeks.

Sensitivity to thiazides; severe renal disease (except nephrosis) or shutdown; severe hepatic disease; impending hepatic coma from thiazide-induced hypokalemia.

Warnings—Patients: 1. No other drugs (particularly "cold preparations" and antihistamines), cheese or alcohol without physician's consent. 2. Promptly report orthostatic symptoms, severe headache, other unusual symptoms. 3. Angina pectoris or coronary artery disease patients must not increase physical activity with improved anginal symptoms or well-being.

Physicians: 1. Use antihistamines, hypnotics, sedatives, tranquilizers and narcotics (meperidine contraindicated) cautiously in reduced doses. 2. Stop Eutron two or more weeks before elective surgery; in emergency surgery reduce premedication (narcotics, sedatives, analgesics, etc.) to 1/4 to 1/5; carefully adjust anesthetic dosage to patient response. 3. Use cautiously in advanced renal failure. 4. Pargyline may induce hypoglycemia. 5. Consider possible sensitivity reactions when a history of allergy or asthma is present. 6. If potassium is indicated, dietary supplement is recommended; enteric-coated potassium tablets may induce serious or fatal small bowel lesions (stenosis with or without ulceration), cause obstruction, hemorrhage, and perforation frequently requiring surgery; discontinue medication immediately if abdominal pain, distention, nausea, vomiting or gastrointestinal bleeding occurs; Eutron does not contain added potassium. 7. Possible systemic lupus erythematosus has been reported for thiazides.

Precautions—Pargyline: Use cautiously at reduced dosage; caffeine, alcohol, antihistamines, barbiturates, chloral hydrate, other hypnotics, sedatives, tranquilizers, narcotics. Periodically do urinalyses, blood counts, liver function tests, etc. Use with caution in liver disease. Watch for orthostatic hypotension, especially in impaired circulation (e.g., angina pectoris, coronary artery disease, cerebral arteriosclerosis); also, augmented hypotension in concomitant febrile illnesses. Reduce or discontinue if hypotension is severe. In impaired renal function watch for cumulative drug effects, elevated BUN and other evidence of progressive renal failure; withdraw drug if these persist. In surgery increased central depressant response (hypotension and increased sedative effect) can be controlled by (1) discontinuing at least two weeks prior; (2) in emergency surgery lowering dose of premedication; (3) when necessary, administering a vasopressor. Do not use in hyperactive and hyperexcitable patients. Pargyline may unmask severe psychotic symptoms where emotional problems pre-exist. Use cautiously in Parkinsonism, especially with antiparkinsonian agents. In prolonged therapy, examine for change in color perception, visual fields, fundi and visual acuity. Also, prolonged therapy has made certain patients refractory to nerve blocking effects of local anesthetics.

Methyclothiazide: Use cautiously in severe renal dysfunction, impaired hepatic function or progressive liver disease; also in pregnancy (bone marrow depression, thrombocytopenia, and altered carbohydrate metabolism have been reported in certain newborn). In surgery thiazide may reduce vasopressor response and increase tubocurarine response. Antihypertensive response may be enhanced following sympathectomy. Watch for electrolyte imbalance (e.g., hyponatremia). Give supplemental chloride if hypochloremic alkalosis occurs and supplemental potassium if hypokalemia occurs (especially in digitalized patients). Thiazides may decrease serum P.B.I. without signs of thyroid disturbance.

Adverse Reactions — Pargyline: Orthostatic hypotension and associated symptoms, mild constipation, fluid retention, edema, dry mouth, sweating, increased appetite, arthralgia, nausea, vomiting, headache, insomnia, difficult in micturition, nightmares, impotence, delayed ejaculation, rash, purpura, weight gain, hyperexcitability, increased neuromuscular activity and other extrapyramidal symptoms. Drug fever is extremely rare. Reduction in blood sugar and hypoglycemic effects are possible. Congestive heart failure has been reported in a few patients with reduced cardiac reserve.

Methyclothiazide: Blood dyscrasias (thrombocytopenia with purpura, agranulocytosis, aplastic anemia); elevation of BUN, blood sugar or serum uric acid (gout may be induced); anorexia, nausea, vomiting, diarrhea, headache, dizziness, paresthesia, weakness, skin rash, photosensitivity, jaundice and pancreatitis. Cutaneous vasculitis in elderly patients has been reported with other thiazides.

If side effects are severe or persist, reduce dosage or withdraw drug. 804438R

Community Hospital Costs on the Rise

The cost to the nation's community hospitals to provide one patient with a day of care rose to an average of $58.06 in 1967, the American Hospital Association reported in the March 16 issue of *Hospitals,* Journal of the AHA.

The figure represents a 15.4% increase over the 1966 average expense of $50.31 per patient day, according to Hospital Indicators, a monthly report published in the Journal.

Increased utilization of hospital facilities played a part in the hospitals' total increased expenses, Hospital Indicators said. For example, total admissions to community hospitals were up nearly 1% in 1967 over 1966, and the average daily census increased 4.2% in the past year.

In addition, the length of patient stay increased from 7.7 days per admission in 1966 to 8.0 in 1967, and the number of outpatient visits jumped by 7% during the year. The occupancy rate was also up in 1967—from 77% to 78.1%.

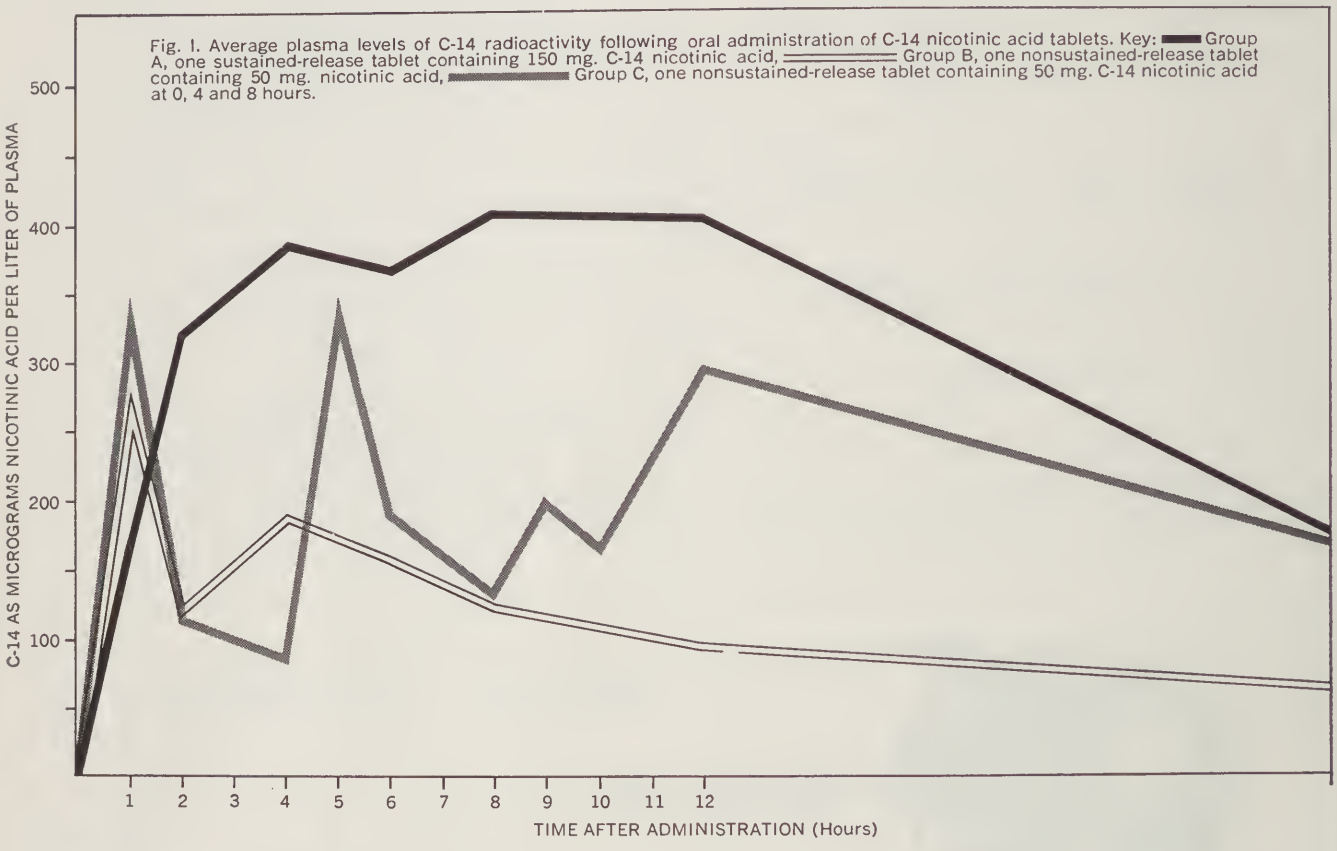
The impact of Medicare upon hospital utilization by persons 65 and over is reflected in the 5.1% increase in the over-65 admissions reported in the last six months of 1967 over the same six months of 1966. The Medicare program began July 1, 1966.

The number of births in hospitals continued to decline in 1967. There were a reported 3.2 million births, a decrease of 1.5% from 1966.

Fulltime hospital employees increased again in 1967, according to Hospital Indicators. In 1946, there were 148 fulltime employees for every 100 patients, but in 1967 that ratio had risen to 264 employees per 100 patients.

Vacation trip....

Motion sickness?



This time it'll be different. Emetrol taken before the trip begins will usually prevent nausea and vomiting. Emetrol is effective and safe...most helpful where safety is most important. It acts locally—not systemically.

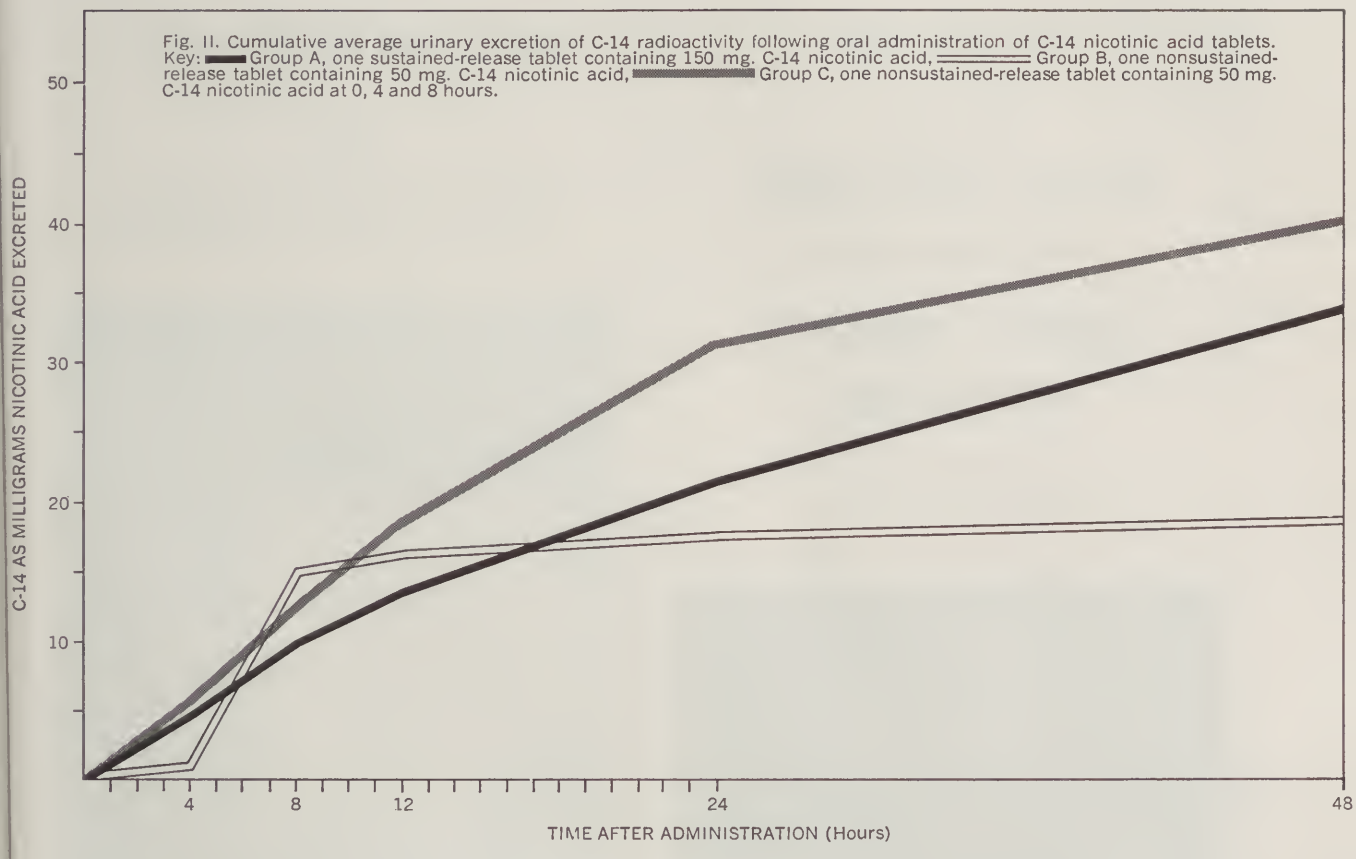
Sustained circulatory, respiratory and cerebral stimulation for the

Fig. 1. Average plasma levels of C-14 radioactivity following oral administration of C-14 nicotinic acid tablets. Key: ▬ Group A, one sustained-release tablet containing 150 mg. C-14 nicotinic acid, ═══ Group B, one nonsustained-release tablet containing 50 mg. nicotinic acid, ▬▬ Group C, one nonsustained-release tablet containing 50 mg. C-14 nicotinic acid at 0, 4 and 8 hours.

(fewer absent doses by absent-minded patients)



Human volunteer subjects were administered Geroniazol TT tablets with the nicotinic acid component made radioactive with C-14. Plasma and urine samples were analyzed. (See Figures I and II) The radioactive tracer study substantiated the previous clinical evidence that the release of nicotinic acid from the Geroniazol TT tablet produced a gradual rise in plasma levels to a plateau for a total of 12 hours and more.

Such proven sustained activity makes the management of geriatric patients much easier by minimizing the possibility of neglected doses through absent-mindedness or senile confusion. Therapy *can* be continuous on a daily dose of only one Geroniazol TT tablet every 12 hours.

The gradual release of nicotinic acid in Geroniazol TT will provide the well-known peripheral vasodilatation needed in patients with deficient circulation and with a minimum amount (if any) of "flushing." Also, cerebrovascular circulation is complemented by pentylenetetrazol, long-established as a cerebral and respiratory stimulant.

Geroniazol TT improves the typical, unfortunate, signs of senile confusion. Patients become more alert,

ged and debilitated

less confused and moody. Personal care, memory, emotional stability, social attention improve. Fatigue, apathy and irritability are reduced.

A prescription for 100 tablets of Geroniazol TT will permit your patients to enjoy the benefits of time-prolonged nicotinic acid/pentylenetetrazol therapy, at an economical price. Dosage is only one tablet every 12 hours.

Contraindications: There are no known contraindications.

Precautions: Exercise caution when treating patients with a low convulsive threshold.

Side Effects: Side effects are rarely encountered, however due to the vasodilatation effect of nicotinic acid, transitory mild nausea, flushing, tingling and pruritus are possible.

Dosage: One tablet every 12 hours.

Supplied: Prescribe bottles of 100 tablets, to take advantage of recent price reduction.

K. Merrill Sumey, Resident Manager

Baltimore County Medical Association

The Baltimore County Medical Association met at the Baltimore County General Hospital at the kind invitation of the Staff on Wednesday, March 20, 1968. The meeting was called to order by the President, Sidney Venable, Jr., MD. Dr. Venable thanked Irvin Hyatt, MD, and the Staff for arranging the meeting and welcomed Dara Dubash, MD, a new member.

The minutes of the previous meeting were approved as published.

The President speaks—Dr. Sidney Venable, President of the Baltimore County Medical Association, addressed the March meeting. On his left are Dr. Gordon Grau, Past President of the organization and Chairman of the Board of Governors, and Dr. Robert Wilder, guest speaker at the meeting.

Correspondence: A letter was received from Charles O'Donnell, MD, for the plant sent to him while he was hospitalized.

Legislation: It was announced the Commission on Medical Discipline has passed the House and Senate and is awaiting the signature of the Governor. This Legislation will take effect in July, 1969 if approved by the Governor. The Abortion Bill is still in Committee.

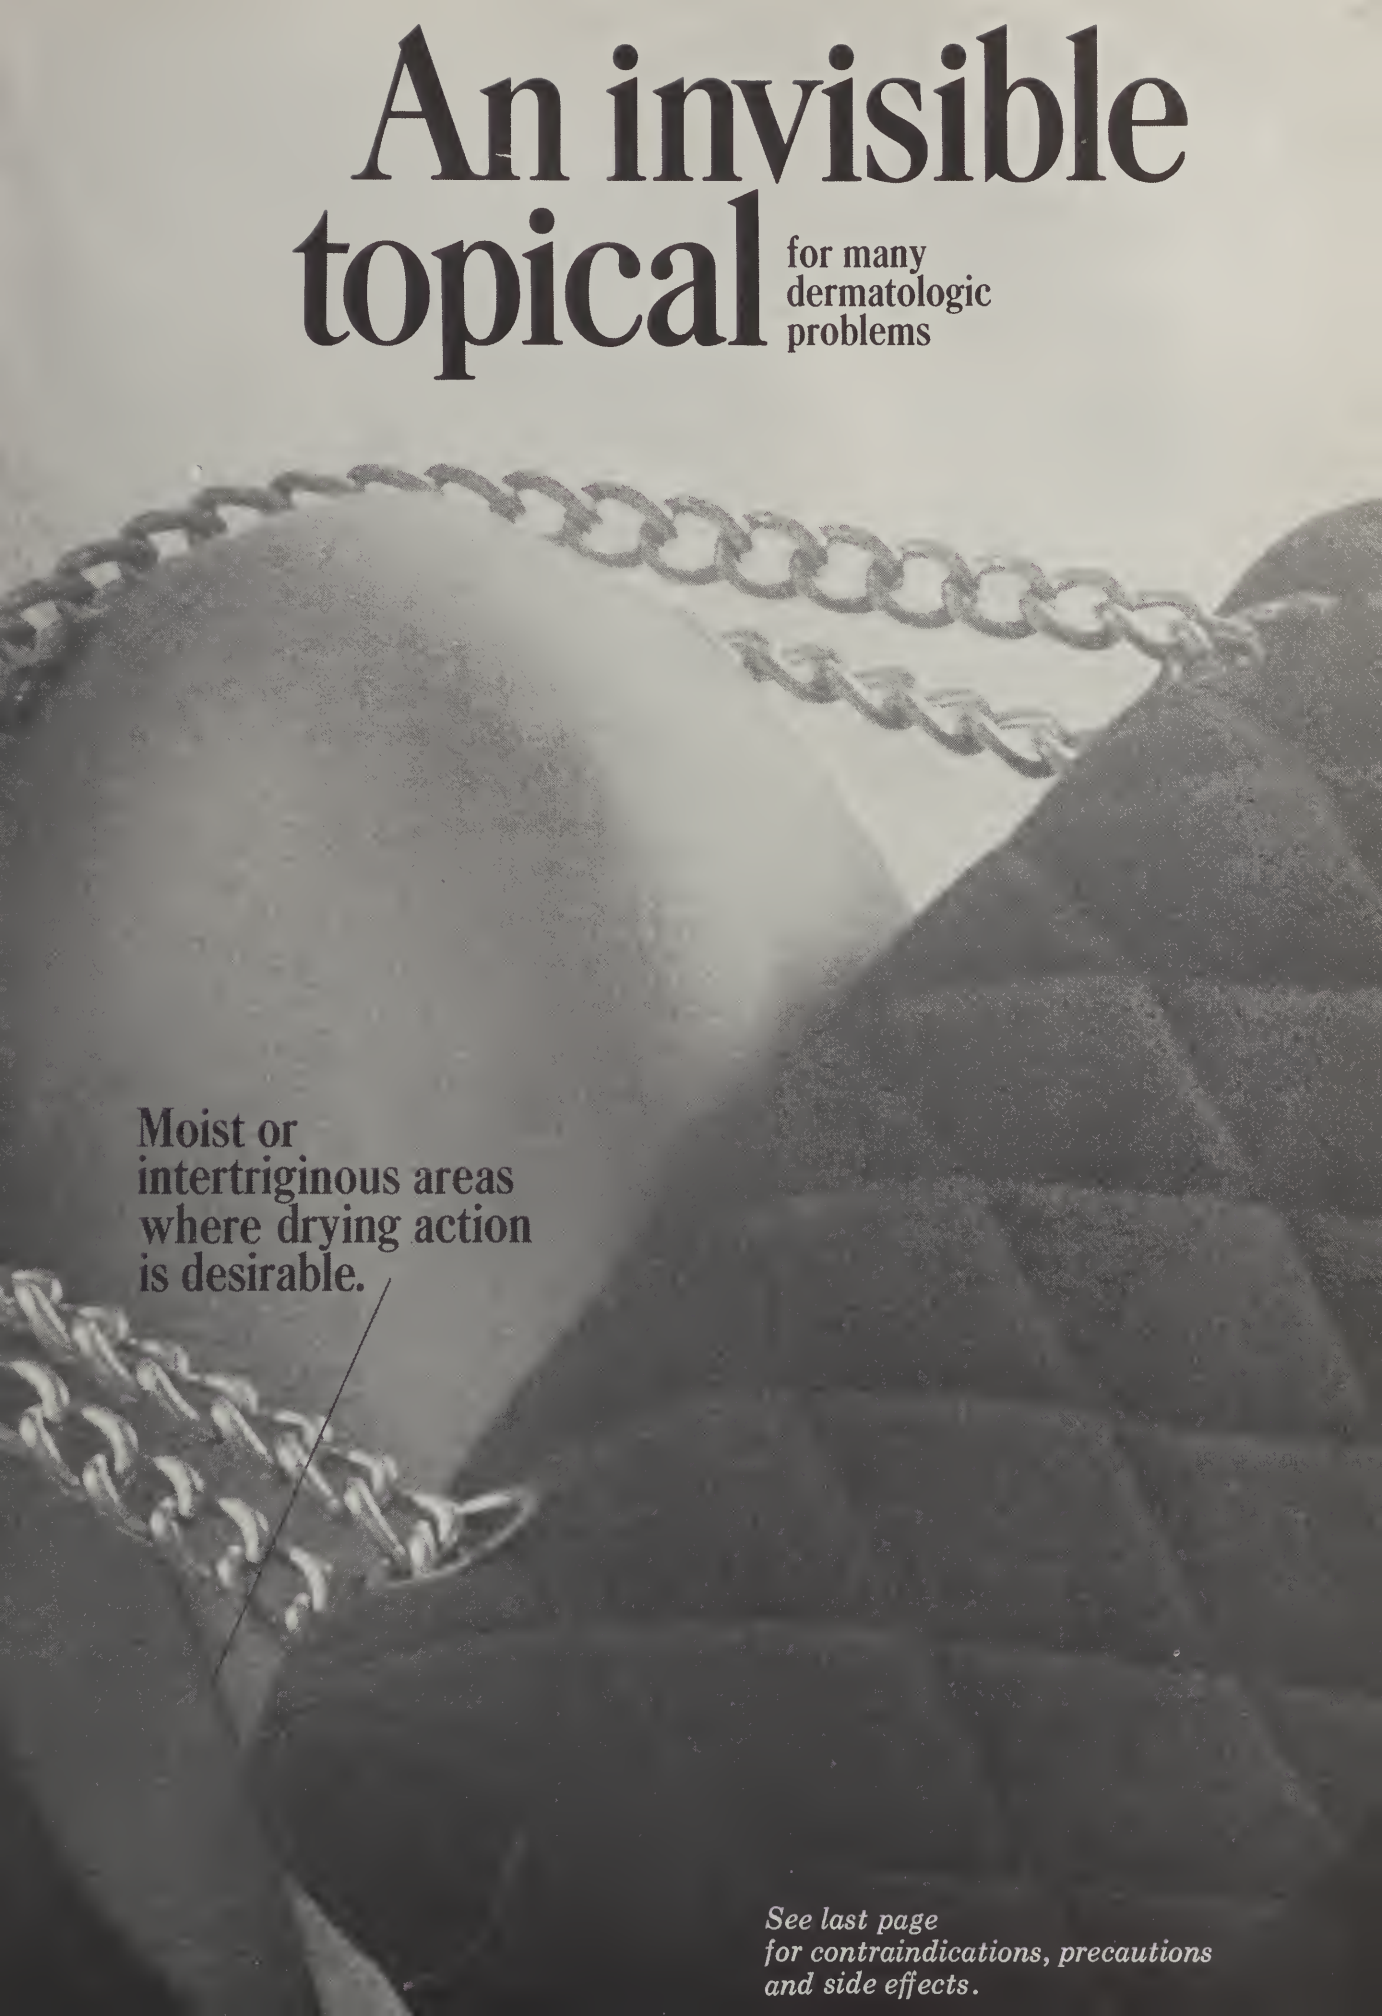
Public Relations: Samuel Bacon, Jr., MD, Chairman, announced an article, relative to our meetings, will appear in the *Maryland State Medical Journal* each month. He has contacted the Jeffersonian paper about our Dinner-Dance on March 31st and hopefully will have a photographer present for pictures.

Program Committee: Theodore Patterson, MD, announced the April meeting will be at the Sheppard-Pratt Hospital, the May meeting will be at the Hilltop Inn and the June meeting at the Penn Hotel. The Woman's Auxiliary will be invited to attend the meeting.

The following applications were approved for membership: Emilio Trujillo, MD, Ercolini Gresia, MD, Maurice Berman, MD, Eli Breger, MD, Alberto Montes, MD, and Julian Goldberg, MD. Associate membership was granted to Raymond Bahr, MD, and James Patrick Flynn, MD.

Congratulations to Stanley Bociek, MD, who has been elected to President of the Staff of the Maryland General Hospital.

James Peterman, MD, announced the American Social Health Association will be mailing questionnaires in July requesting the Physicians to report all cases of Venereal Disease during the months of April, May and June.



Robert Wilder, MD, well-known Thoracic Surgeon, gave a very interesting talk on "Pacemakers—Past and Present." He demonstrated this with slides and actual pacemakers which had been removed from patients.

Samuel N. Bacon, MD,
Chairman—Public Relations

Hairy sites where creams and ointments do not spread or penetrate readily.
Exposed areas where cosmetic considerations are important.

An invisible topical

for many dermatologic problems

Moist or intertriginous areas where drying action is desirable.

See last page for contraindications, precautions and side effects.

Structurally unique topical steroid in propylene glycol vehicle produces rapid response in many dermatoses.

Synalar Solution produces rapid antiinflammatory, antipruritic action through its unique topical corticosteroid, fluocinolone acetonide. The propylene glycol vehicle provides additional benefits for therapy at problem sites where it is difficult to achieve contact between the lesion and medication—or where creams or ointments may make the lesions worse. Synalar Solution has proved particularly valuable in the symptomatic treatment of seborrheic dermatitis of the scalp, nasolabial folds, eyebrows, ears, and in flexural folds such as the axillae, inframammary, umbilical and anocrural areas. It has also been reported to achieve excellent results in the adjunctive management of atopic dermatitis, contact dermatitis, neurodermatitis, nummular eczema, psoriasis, and sweat retention syndromes in these problem sites.

Penetrates the hairy sites.

In many areas of the body, hair gets in the way of treating the underlying dermatitis. The propylene glycol vehicle of Synalar Solution permits penetration and dispersion at sites where creams and ointments do not readily penetrate. May be applied without matting of hair.

Ideal for moist or intertriginous areas.

Propylene glycol is strongly hygroscopic and is especially useful where sweat retention is a problem. Its low surface tension permits easy spreadability in difficult-to-treat body areas. A number of studies have also shown that propylene glycol has inherent antimicrobial activity.

ecause of the properties
propylene glycol and the
lligram potency of
cinolone acetonide, a small
ntity of Synalar Solution
s a long way. Also, the
scription price of a 20 cc.
stic squeeze bottle of
alar Solution is surprisingly
. Thus, your patients obtain
nomy with the proved
acy of a potent, truly
anced topical corticosteroid.

Contraindications: Tuberculous, fungal, and most viral lesions of the skin (including herpes simplex, vaccinia, and varicella). Not for ophthalmic use. Contraindicated in individuals with a history of hypersensitivity to any of the components.

Precautions: In some patients with dry lesions, the solution may increase dryness, scaling, or itching. Application to denuded or fissured areas, such as genital or perianal sites, may produce a burning or stinging sensation. If this persists and dermatitis does not improve, discontinue medication. Although propylene glycol has antiseptic activity, there should be careful initial evaluation and follow-up of infected sites. Incomplete response or exacerbation of lesions may be due to true infection, which requires susceptibility testing and appropriate therapy. On the other hand, saprophytic or low grade infections may clear spontaneously under the influence of Synalar Solution alone. Where severe local infection or systemic infection exists, the use of systemic antibiotics should be considered, based on susceptibility testing. While topical steroids have not been reported to have adverse effect on pregnancy, the safety of their use on pregnant females has not absolutely been established. Therefore, they should not be used extensively on pregnant patients, in large amounts, or for prolonged periods of time.

Side Effects: Side effects are not encountered ordinarily with topically applied corticosteroids. As with all drugs, however, a few patients may react unfavorably to Synalar under certain conditions.

Availability: Synalar (fluocinolone acetonide) Solution 0.01% in a propylene glycol vehicle with citric acid as preservative. 20 and 60 cc. plastic squeeze bottles. *Also available:* Synalar (fluocinolone acetonide) Cream 0.025%—5, 15 and 60 Gm. tubes and 425 Gm. jars. Cream 0.01%—15, 45 and 60 Gm. tubes and 120 Gm. jars. Ointment 0.025%—15 and 60 Gm. tubes. Neo-Synalar® (neomycin sulfate 0.5% [0.35% neomycin base], fluocinolone acetonide 0.025%) Cream—5, 15 and 60 Gm. tubes.

Methods for Reimbursing

Following a directive in a recent Health Message from the President, Robert M. Ball, Commissioner of Social Security, announced the beginning of an experimental program to find methods of reimbursing hospitals and doctors that will have built-in incentives to efficiency and economy as well as maintaining a high level of quality care.

"The experiments," the Commissioner said, "are expected to develop ways to get more value for the dollar spent on health care and will be applicable in reimbursing hospitals and doctors under Medicare and other federal health programs.

"Participation in the experiments by hospitals and other health care institutions, by physicians, and by organizations and associations, will all be welcome," he stated. "Participation is entirely voluntary and proposals will be evaluated by a panel of experts and the best selected will be used for experimentation."

Participation by governmental organizations and by nongovernmental organizations, such as Blue Cross and Blue Shield plans, group practice prepayment plans, labor management plans, union clinics, and private proposals from providers themselves, will be advantageous. The experiments that turn out favorably may benefit the entire health care system, private as well as governmental.

Under the medicare law, hospitals and other institutional providers of medicare services are reimbursed for their reasonable costs under a

spitals and Doctors Sought

national reimbursement formula which provides guidelines as to which costs are allowable. The formula has been criticized on the ground that it provides no special incentives for economy and efficiency.

Reimbursement to physicians for services provided medicare beneficiaries is made by insurance carriers under Government contract on the basis of reasonable charges—generally the charge allowed is the customary charge of the physician as long as it is within the prevailing range of charges by other physicians in the locality.

The generally applicable reimbursement principles may be waived for the experimental projects, Ball pointed out, under authorization provided in the Social Security Amendments of 1967, signed into law by President Johnson on January 2.

The Commissioner further stated that guidelines for the use of those who wish to submit proposals for medicare experimentation or experimentation involving medicare and other federal programs may be obtained by writing to Thomas M. Tierney, Director, Bureau of Health Insurance, Social Security Administration, Balto., Md. 21235.

Guidelines for proposed experiments with methods of reimbursements that are primarily concerned with the medicaid and maternal and child health programs should be directed to the Social and Rehabilitation Service, 330 Independence Ave., Washington, D. C. 20201.

mudrane®

for

- EMPHYSEMA
- ASTHMA
- CHRONIC BRONCHITIS
- BRONCHIECTASIS

The fast-disintegrating uncoated tablet gives relief in 15 minutes

Each tablet contains:

Potassium Iodide . . . . . 195 mg.
Aminophylline . . . . . 130 mg.
Phenobarbital, Caution: May be habit forming . . . 21 mg.
Ephedrine HCl . . . . . 16 mg.

FEDERAL LAW PROHIBITS
DISPENSING WITHOUT PRESCRIPTION

Precautions: Usual for aminophylline-ephedrine-phenobarbital. Iodides may cause nausea, long use may cause goiter. Discontinue if symptoms of iodism develop.

Iodide contraindications: tuberculosis, pregnancy.

DOSAGE

One tablet, with full glass of water, 3 or 4 times daily.

Dispensed in bottles of 100 and 1000 tablets.

MUDRANE GG—Formula, dosage and package identical to Mudrane—*except*—100 mg. glyceryl guaiacolate replaces the potassium iodide. The value of Mudrane cannot be enjoyed by a small group in which K.I. is contraindicated. Mudrane GG is prepared for this group.

MUDRANE GG ELIXIR—Four 5 cc teaspoonfuls is equivalent to one Mudrane GG tablet. Dosage adjusted to age and weight of child. Mudrane GG Elixir is for pediatric patients and those who think they cannot swallow tablets. Dispensed in pint and half gallon bottles.

Medicine is Career Choice of 767 National Merit Scholarship Semi-Finalists

The practice of medicine continues to be a preferred career choice among the nation's scholastic elite—semi-finalists in the National Merit Scholarship Program—although the number planning to study medicine has declined from a year ago.

This has been revealed by an unofficial AMA study of information contained in the National Merit Scholarship Corporation's catalog listing the 14,000 students honored as semi-finalists in the 13th Annual Merit program for 1967-1968. Academically, all are in the 99th percentile of the nation's graduating seniors.

Of the 10,779 career-decided students, 7% (767) indicated that they seek to become Doctors of Medicine. This represents an appreciable decline from a year ago when 8% (950) indicated medicine as their career choice. An offsetting factor, however, was the fact that last year was a "bumper year" in which 159 more semi-finalists listed medicine as their career choice than did so in the 1965-1966 program.

COMPARISON OF SELECTED SCIENTIFIC AND HEALTH CAREER CHOICES 1967-1968, 1966-1967 & 1965-1966—NATIONAL MERIT SCHOLARSHIP SEMI-FINALISTS*

Career Choice	Number Selecting In 1967-1968 Program	Number Selecting In 1966-1967 Program	Number Selecting In 1965-1966 Program
Physician	767	950	791
Physicist	643	681	506
Scientist (unspecified)	543	480	539
Chemist	352	433	288
Biological Scientist	341	354	266
Psychologist	223	233	136
Biochemist	212	237	144

Pharmacist	29	38	26
Biophysicist	20	26	13
Physical Therapist	18	19	19
Undecided/Unreported	3,221	2,266	4,544
GRAND TOTALS	6,789	6,164	7,592

* Based on an unofficial, non-computerized tabulation of the career choices shown in the National Merit Scholarship Books.

Not included in tabulation made of 1965-1966 semi-finalists.

For the third consecutive year one out of every three semi-finalists indicated a decision to enter medicine or a closely allied field. Twenty-seven percent of all career-decided candidates plan to become either physicians, physicists (643), scientists-unspecified (543), chemists (352), biological scientists (341) or biochemists (212).

If the 3,221 career-undecided or unreported semi-finalists in the 1967-68 program were to make career choices at the same ratio as the 10,779 who have reached their decisions, it would indicate that 996 plan to study medicine. The comparable figure for the 1966-67 candidates was 1,133.

Numbers choosing other professions included in the compilations were physical scientists, 97; social workers, 91; nursing, 84; medical technologists, 62; veterinarians, 56; dentists, 30; pharmacists, 29; biophysicists, 20; and physical therapists, 18.

In April, congratulatory letters from Milford O. Rouse, MD, president of the AMA, were sent to each of the 3,568 semi-finalists planning to enter medicine or an allied field. Included was a copy of *Horizons Unlimited,* AMA's careers handbook.

A slightly varying letter also was sent to the 3,221 students who had not yet decided upon their career choices. It encourages them to investigate careers in medicine and allied fields and invites them to write for a complimentary copy of *Horizons Unlimited.*

This marks the third year this program has been carried out on behalf of the nation's physicians.

New Technique for Radium Leakage Detection

A low-cost photographic method for detecting leaks in sealed radium capsules and needles with greater speed than can be achieved with currently used techniques has been developed by the Public Health Service's National Center for Radiological Health.

The method is designed to facilitate testing sealed radium sources with sufficient frequency to insure discovery of leaks before radioactive contamination is spread through buildings, storage facilities, and other areas where radium is kept and used.

The photographic leak detection technique, as developed in the Center's Southeastern Radiological Health Laboratory at Montgomery, Alabama, requires only about six minutes for film exposure and print processing. As long as 24 hours may be needed for methods now used.

The photographic technique can be employed to detect point sources of leaking or exposed radium salts in quantities as low as 500 picocuries. Detection of this low level is possible in sources having a total strength of up to 50 mg of radium.

Development of the photographic detection method primarily was the work of Paul H. Bedrosian, PhD, Chief of the Radium Technology Unit at the Southeastern Radiological Health Laboratory.

"The new technique represents a safe, effective system which can be used easily and at relatively little cost to protect physicians, patients, and the general public against a significant source of unnecessary radiation exposure," said James G. Terrill, Jr., Director of the National Center for Radiological Health.

"It should be emphasized that leaks from radium capsules or needles often cannot be detected visually," Mr. Terrill said. "Many sealed sources which appear to be structurally sound, leak invisible and hazardous radiations as badly as obviously broken ones."

The essence of the new detection technique lies in the ability of radiations of alpha particles to interact with a zinc sulfide scintillator to produce light. Registration of the light on high-speed photographic film shows radium capsules or needles to be leaking, since alpha particles cannot penetrate unfractured walls of a sealed source.

Two film exposures are made for each detection procedure. In one exposure, a shield is used which prevents alpha particles from interacting with zinc sulfide but does not prevent passage of beta and gamma radiations. These, therefore, interact with the scintillator. The resulting light is focused through a lens and a well-defined image is formed on the film.

The shield is removed for the second picture so that light from alpha, beta, and gamma interactions with zinc sulfide are registered on film. Comparison of the images on the two films shows the alpha contribution and, therefore, the presence of a leak.

Investigators at the Southeastern Radiological Health Laboratory have found that the photographic method can be used to detect leaks or contamination at various points along the lengths of radium sources. The technique also can be employed to distinguish among sources containing varying amounts of radium and to detect radioactive contamination picked up by wiping a suspected area.

Let's be specific about Campbell's Soups... and *reducing diets*

There are more than 30 million people in America who are overweight. During the next year, you probably will see more than 1,000 of them in your own practice.

One good way to help these patients is to give them a reducing diet based on ordinary eating patterns.

Campbell has prepared a sensible plan for weight control based on ordinary eating patterns. The plan consists of a patient instruction booklet and a set of menus which provide approximately 1,200 calories daily. The menus are balanced to provide the minimum daily requirements of nutrients.

To obtain a supply for your office write to:
Campbell Soup Company, Box 265, Camden, N. J. 08101

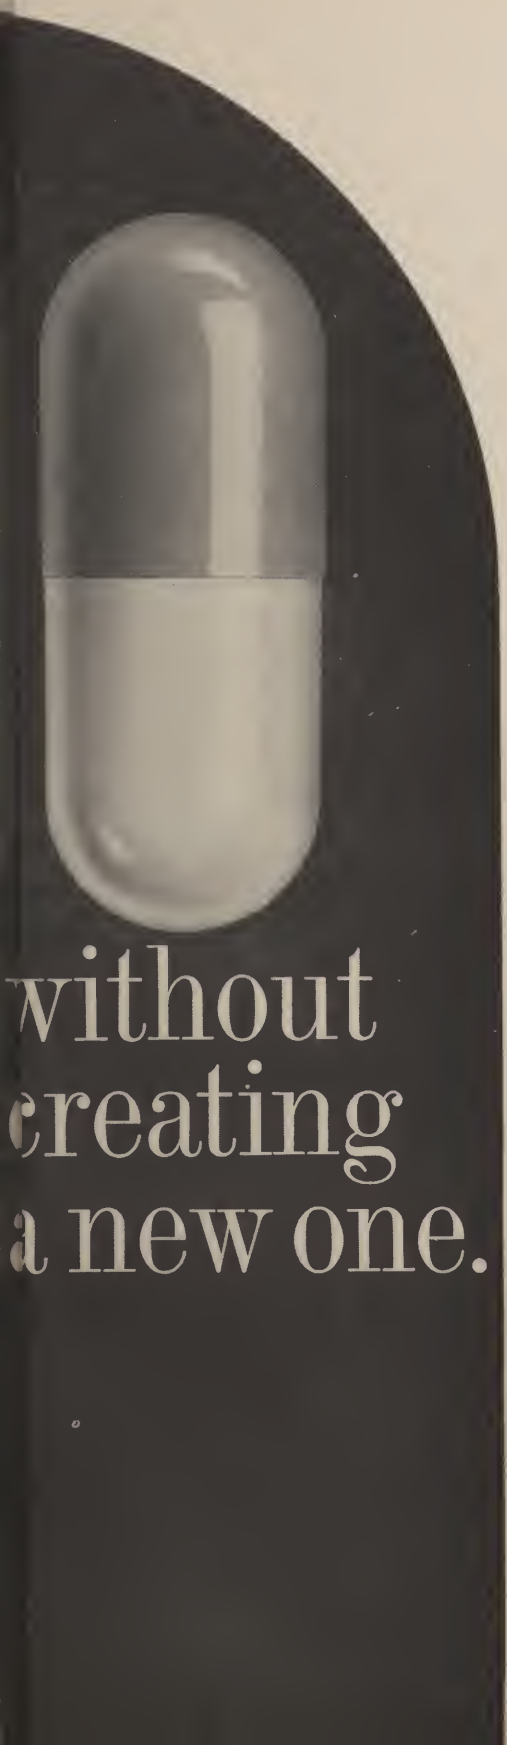
Vistaril®

HYDROXYZINE PAMOATE

an antianxiety agent that serves a human need...

"The danger involved in prescribing dependency producing medication for relief of anxiety lies in the fact that we do not know in advance the dependency proneness of the individual."[1]

A woman who is undergoing the emotional stresses of the menopause may, for the first time, need an antianxiety agent. But she may also be susceptible to drug abuse.



Vistaril can fulfill the need for tranquilization without creating a new need—dependency.

Vistaril calms anxiety and agitation quickly—usually begins to work in 15-30 minutes. And, in more than ten years of clinical use, after more than a billion doses to date, there have been no reported instances of dependency on hydroxyzine.

When the need for antianxiety medication is reduced or no longer exists, Vistaril dosage may be lowered or discontinued without ill effects.

Recommended starting dose, anxious menopausal patient, 50 mg. t.i.d.

With Vistaril, it is as easy to stop therapy as it is to start.

Contraindications: Hypersensitivity to hydroxyzine. The parenteral solution, for intramuscular or intravenous use, *must not* be injected subcutaneously or intra-arterially.

Hydroxyzine, when administered to the pregnant mouse, rat, and rabbit induced fetal abnormalities in the rat at doses substantially above the human therapeutic range. Clinical data in human beings are inadequate. Until adequate data are available to establish safety in early pregnancy, hydroxyzine is contraindicated during this period.

Precautions: Hydroxyzine may potentiate the action of central nervous system depressants such as narcotics and barbiturates. In conjunctive use, dosage for these drugs should be decreased as much as 50%. Because drowsiness may occur, patients should be cautioned against driving a car or operating dangerous machinery. The usual precautions for intramuscular injection should be followed; soft-tissue reactions have rarely been reported when proper technique has been used. Hydroxyzine parenteral solution for intramuscular use should be injected well within the body of a relatively large muscle. In adults, the preferred sites are the upper outer quadrant of the buttock (i.e., gluteus maximus), or the mid-lateral thigh. In children, preferably the mid-lateral muscle of the thigh. In infants and small children the upper outer quadrant of the gluteal region should only be used when necessary, as in burn patients, in order to minimize the possibility of damage to the sciatic nerve. The deltoid area should be used only if well developed, such as in certain adults and older children, and only with caution to avoid radial nerve injury. Injections should not be made in the lower and middle thirds of the upper arm. Aspiration should be done to help avoid intravascular injection. On reported intravenous injection a few instances of digital gangrene have occurred distal to the injection site, considered to be due to inadvertent intra-arterial injection or possibly periarterial extravasation. Therefore, particular caution (aspiration and site injection) should be observed to insure injection only into intact veins; avoid either intra-arterial injection or extravasation. Intravenous administration should be accomplished slowly, no faster than 25 mg. per minute, and not to exceed 100 mg. in any single dose. In order to avoid possible adverse effects it is recommended that hydroxyzine parenteral solution be diluted to at least 50 cc. with sterile normal saline and administered over a period of four minutes or more, preferably into the tubing of a running intravenous infusion.

The intravenous administration of this drug is not recommended for children under 12 years of age.

Adverse Reactions: Drowsiness may occur; if so, it is usually transitory and may disappear in a few days of continued therapy or upon dosage reduction. Dryness of the mouth may occur with higher doses. Involuntary motor activity, including rare instances of tremor and convulsions, has been reported, usually with higher than recommended dosage.

When this product is given intravenously undiluted, minimal amounts of intravascular hemolysis occur at the site of injection. Giving the maximum recommended intravenous dose (100 mg.) to adults results in immediate transient hemolysis with the liberation of a total of 2-3 grams of hemoglobin, which, in some individuals, can cause small amounts of hemoglobinuria. This compares with the normal red cell destruction from which approximately 8 Gm. of hemoglobin are liberated every 24 hours. If the hydroxyzine is diluted with 50 cc. of normal saline and given during a period of four minutes or more, this phenomenon does not occur.

Supply: Vistaril (hydroxyzine pamoate) Capsules: Equivalent to 25 mg., 50 mg., 100 mg. hydroxyzine HCl. Vistaril (hydroxyzine pamoate) Oral Suspension: Equivalent to 25 mg. hydroxyzine HCl per 5 cc. teaspoonful. Vistaril (hydroxyzine HCl) Parenteral Solution: 25 mg./cc.—10 cc. vial and 50 mg./cc.—2 cc. and 10 cc. vial; Isoject,® 25 and 50 mg. per cc., 1 cc. per unit.

More detailed professional information available on request.

burning
itching
discharge
of trichomonal vaginitis...

Flagyl®

tablets/inserts

brand of

metronidazole

brings
• clinical cures
• microscopic cures
• culture cures

For the most widespread form of vaginitis the most widely successful therapeutic agent, Flagyl, is clearly indicated.

In trichomonal vaginitis, most physicians have reported a cure-rate of 95 per cent or more with Flagyl when infected male partners are treated concurrently and when treatment is repeated for occasional refractory infections in women.

Among the few patients who do not respond to Flagyl are those who may not have taken the prescribed dosage and those who may have been reinfected.

This high rate of cure obtained with Flagyl is unparalleled. Only systemically active Flagyl reaches the hidden reservoirs of reinfection in male and female genitourinary tracts.

Indications: Flagyl is indicated only in the treatment of trichomoniasis in both the male and female.

Contraindications: Pregnancy; disease of the central nervous system; evidence or history of blood dyscrasia.

Precaution: Complete blood cell counts should be made before, during and after therapy, especially if a second course is necessary.

Side effects: Infrequent and minor side effects include nausea, metallic taste and furry tongue. Gastrointestinal disturbances, flushing and headache sometimes occur, especially with concomitant ingestion of alcohol. The taste of alcoholic beverages may be altered. Other effects, all reported in an incidence of less than 1 per cent, are diarrhea, dizziness, vaginal dryness and burning, dry mouth, rash, urticaria, gastritis, drowsiness, insomnia, pruritus, sore tongue, darkened urine, anorexia, vomiting, epigastric distress, dysuria, depression, vertigo, incoordination, ataxia, abdominal cramping, constipation, stomatitis, numbness or paresthesia of an extremity, joint pains, confusion, irritability, weakness, cystitis, pelvic pressure, dyspareunia, fever, polyuria, incontinence, decreased libido, nasal congestion, proctitis and pyuria. Elimination of trichomonads may aggravate candidiasis.

Dosage and Administration: In women: one 250-mg. oral tablet three times daily for ten days. A vaginal insert of 500 mg. is available for local therapy when desired. When used, one vaginal insert should be placed high in the vaginal vault each day for ten days; concurrently two oral tablets should be taken daily.

In men: When trichomonads are demonstrated, one 250-mg. oral tablet twice daily for ten days in conjunction with treatment of his female partner.

Dosage Forms: Oral tablets—250 mg.
Vaginal inserts—500 mg.

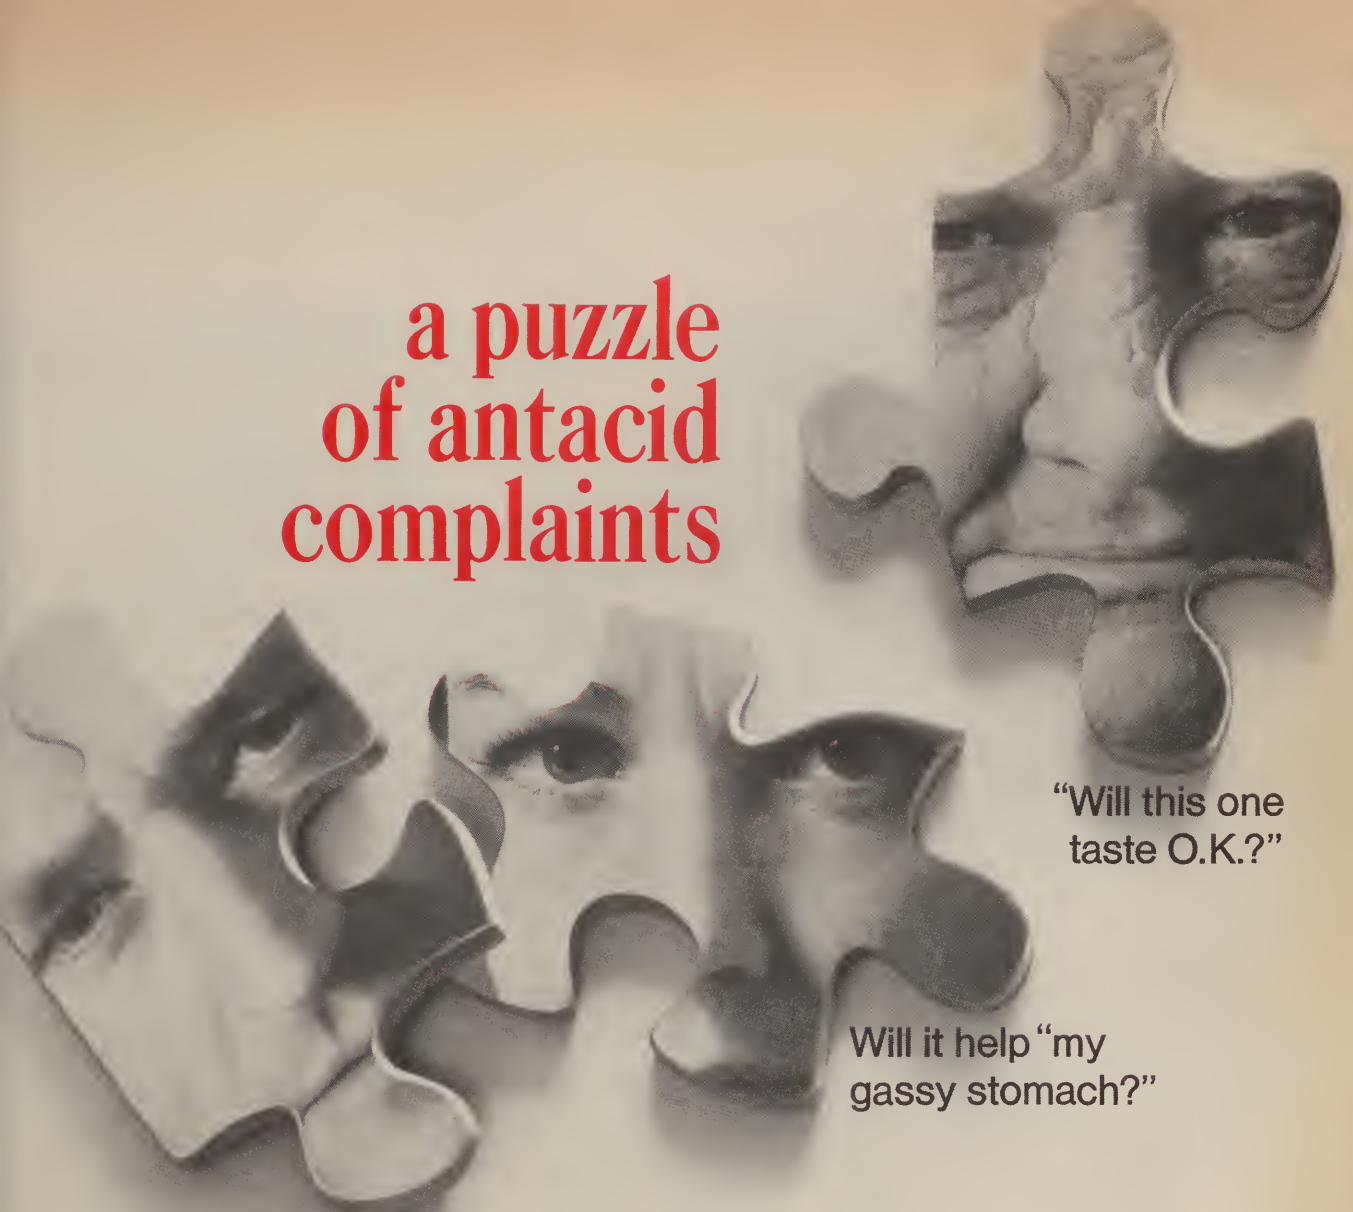
CONTROL FOOD AND MOOD ALL DAY LONG WITH A SINGLE MORNING DOSE

AMBAR #2 EXTENTABS®

methamphetamine HCl 15 mg., phenobarbital 64.8 mg. (1 gr.) (Warning: may be habit forming).

One Ambar Extentab before breakfast can help control most patients' appetite for up to 12 hours. Methamphetamine, the appetite suppressant, gently elevates mood and helps overcome dieting frustrations. Phenobarbital, the sedative in Ambar, controls irritability and anxiety...helps maintain a state of mental calm and equanimity. Both work together to ease the tensions that erode the willpower during periods of dieting.



Also available: Ambar #1 Extentabs®—methamphetamine hydrochloride 10 mg., phenobarbital 64.8 mg. (1 gr.) (Warning: may be habit forming).

BRIEF SUMMARY/**Indications:** Ambar suppresses appetite and helps offset emotional reactions to dieting. **Contraindications:** Hypersensitivity to barbiturates or sympathomimetics; patients with advanced renal or hepatic disease. **Precautions:** Administer with caution in the presence of cardiovascular disease or hypertension. **Side Effects:** Nervousness or excitement occasionally noted, but usually infrequent at recommended dosages. Slight drowsiness has been reported rarely. See package insert for further details.

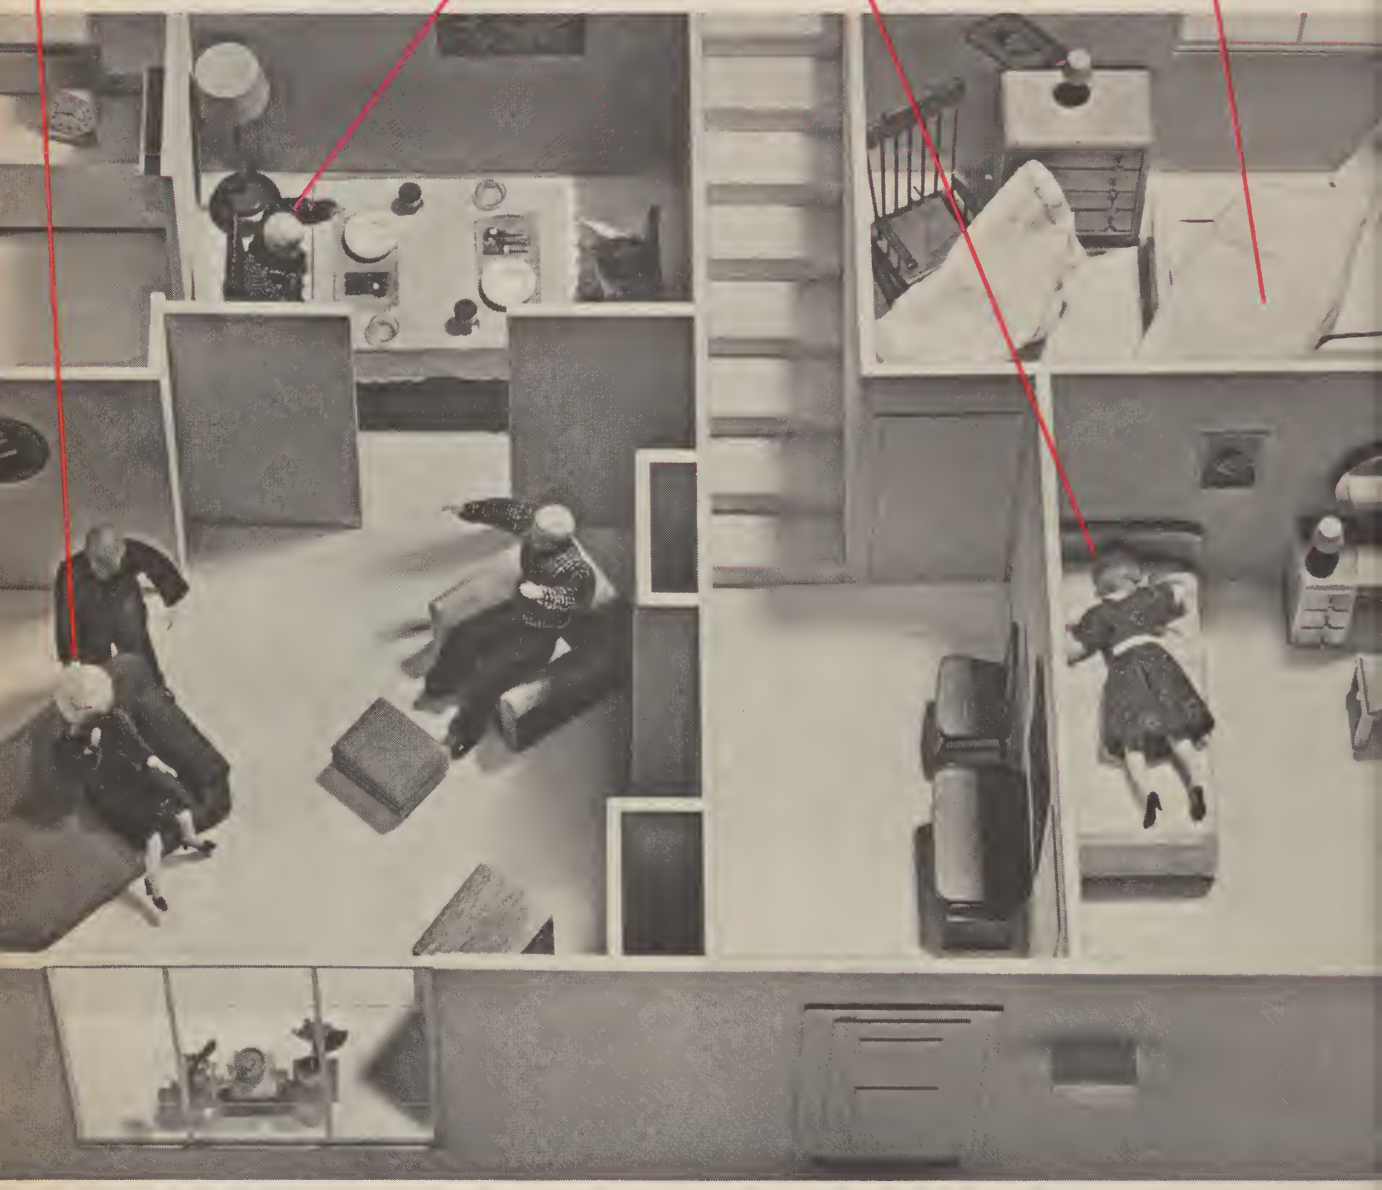
Stuart

Division/Pasadena, Calif.
ATLAS CHEMICAL INDUSTRIES, INC.



When the agitated geriatric disrupts the home...

His daughter can't please him. There is "just no living with him."

His disturbances at the table make every meal a nightmare.

His teen-age granddaughter won't invite friends home because of his outbursts.

His slovenly room and habits create more tension.

In moderate to severe anxiety...

- Mellaril helps control the most frequent symptoms: marked tension, agitation, apprehension, restlessness, hypermotility
- Mellaril often alleviates anxiety-induced somatic complaints
- Mellaril frequently helps strengthen emotional resources
- Mellaril helps the patient maintain realistic contact with environment, closer harmony with family

Contraindications: Severely depressed or comatose states from any cause, and in association with or following MAO inhibitors; severe hypertensive or hypotensive heart disease.

Precautions: Hypersensitivity reactions (e.g., leukopenia, agranulocytosis) and convulsive seizures are infrequent. Pigmentary retinopathy has been observed where doses in excess of those recommended were used for long periods of time. May potentiate central nervous system depressants, atropine, and phosphorus insecticides. Where complete mental alertness is required, administer the drug cautiously and increase dosage gradually. In addition, orthostatic hypotension (especially in female patients) has been observed. Epinephrine should be avoided in treatment of drug-induced hypotension.

Side Effects: Pseudoparkinsonism and other extrapyramidal disorders are infrequent; drowsiness, especially in high doses early in treatment, may occur; nocturnal confusion, dryness of the mouth, nasal stuffiness, headache, peripheral edema, lactation, galactorrhea, and inhibition of ejaculation are noted on occasion; photosensitivity and other allergic skin reactions may occur but are extremely rare.

for moderate to severe anxiety

Mellaril®

(thioridazine)

The "Diet Pill" Scandal: Is an Ethics Committee Review of the Local Situation Needed?

Diet pills, their effects on health in the treatment of the obese have attracted widespread attention across the country recently. While the Food and Drug Administration attacked the manufacturers of weight-reducing pills, Congress listened to hearings on the ethical and legal aspects of physicians and osteopaths who specialize in the treatment of the obese.

As the representative of the medical profession, the AMA was invited to testify before Congress. The testimony reiterated the policy adopted by the AMA House of Delegates last June:

"There is no ethical or legal ruling which would prevent a physician from limiting his practice to the treatment of obesity but this is not a recognized specialty. Since obesity may be only a sign, many disciplines of medicine may be involved in proper treatment."

While the practice of weight-control is ethical and proper, the misuse of medical procedures or the failure to render acceptable medical care to individual patients is to be condemned.

The AMA further directed medical societies to accept as an obligation the protection of the people in the community from physicians who are not practicing medicine's high standards. The obligation of the medical society is to properly review the practices of some physicians who deal primarily or exclusively in the area of weight-control and if conclusive evidence is found, a case should be presented before the Ethics Committee.

Some of the guidelines for preparing cases recommended by the AMA are:

- If physicians engaged in this type of practice are not taking adequate histories, not conducting adequate physical examinations, are over-prescribing, or are prescribing medications which have not been found to be safe and efficacious, then they are guilty of unethical conduct and very probably guilty of malpractice as well.
- Testimony could be received from patients as to the type of practice followed.
- Justification that the accepted practice in the community was of a different nature than the procedure followed would have to be presented before the Ethics Committee.

In August, a group of doctors from the Faculty completed a study of weight reduction programs being conducted throughout Maryland both by lay organizations and physicians. Twelve practices were reviewed by the Mediation Subcommittee for the Study of Obesity and its Treatment and the subcommittee made the following recommendation:

No further investigation into the practice of Bariatrics is believed indicated, at this time, but this is a matter for decision by the full Mediation Committee. Those physicians who have indicated some shortcomings in their current practices should be advised of such shortcomings.

The committee issued a warning to the general public in which it was stated that "The treatment of obesity requires careful medical control and close supervision of patients. It cannot be isolated from concern for co-existing diseases such as diabetes or heart disease. It requires very definite diagnostic skills in which the physician can bring to bear all available knowledge of human physiology, metabolism, and current information on the patient's responses to weight reduction."

Studying and Treating the Obese Patient[1]

A large outpatient study leads to the conclusion that obesity is not a disease but a sign of disease and that metabolic functions often can be returned to normal with intensive medical management. A plan for office management of obesity is advanced on the basis of this hospital study.

NEIL SOLOMON, MD, PhD[2]

There are no clear-cut medical text book answers to the question of the best way of treating obesity. The reason is that obesity is not a disease but the sign of some underlying problem. Whether the problem is purely psychological or physiological or a combination of the two is up to the physician to determine and to treat specifically and appropriately. The doctor best able to perform this duty is the physician who is best acquainted with the patient and the multifactors that affect his total picture. Generally this is the patient's family physician. If after conscientious treatment, the patient manifests "intractable obesity" then the physician may want to refer the patient to an endocrinologist.

Recent newspaper and magazine reports and Congressional inquiries into diet therapy with so-called rainbow pills attest again to society's so-far fruitless search for short cuts in obesity treatment. The desire to have our cake, eat it, and—in the bargin—lose weight has yet to give rise to rational therapy. It may never do so. Drugs may appear to give substance temporarily to the illusion that pills may compensate for persistent feasting. But there is a limit to the effects of amphetamines, phenobarbital, diuretics and other drugs in dampening appetite and otherwise apparently promoting some weight loss. Inasmuch as many obese persons have cardiovascular disease, diabetes, and other conditions, the prescribing of pills and diets with only superficial physical examination and medical assessment, if any at all, undoubtedly is foolhardy. Nonetheless, individuals on "rainbow pills" occasionally have to be hospitalized when their vigorous pursuit of weight loss has been channeled into indiscriminate pill taking. Congress was told of one individual virtually paralyzed after sustained use of excessive thyroid pills. The U.S. Food and Drug Administration has an Illinois coroner's report that 14 deaths *may have been due* to "diet pills."

The price of the pill-taking illusion is high in disappointment and morbidity. Reality, however, carries a high price. Physician and patient must be tenacious in the face of the manifold challenges of obesity—medical, psychological and social. The physician must commit his own talents and the resources of others in support of the patient. And the patient must forego many gustatory pleasures, learn how and what to eat, and form attitudes that will prevail the rest of his life.

The purpose of the Baltimore City Hospital study was to demonstrate in a large outpatient population that tenacious employment of diet, biochemical monitoring, and the physician's expertise in frequent consultations with the patient

1. This investigation was supported in part by USPHS research grant #FR33, from the General Clinical Research Centers Branch (DRFR, National Institutes of Health).

2. Dr. Solomon is associate professor of physiology and assistant professor of medicine at the University of Maryland, assistant chief of medicine at Baltimore City Hospital, instructor in medicine at Johns Hopkins University, and Consulting Endocrinologist for the Veterans Administration.

will work over the long haul to stabilize weight at healthy values. After five years of a study expected to continue for a lifetime, 217 of 541 obese outpatients have been brought to ideal weight and have maintained it for at least two years. Another 191 patients are losing but have not reached ideal weight. Some 133 patients have dropped from the study and are classified as treatment failures.

The rationale of the treatment approach described derives from characteristics of the obese population. This is not a small group in American life; 1 in 5 Americans is overweight, that is, more than 10% over the ideal weight shown in Table 1. An obese population has an unusual concentration of afflictions. At Baltimore City Hospitals, where the study of the outpatients is conducted, 260 of the 541—nearly half—had one or more of the conditions listed below, the number of patients with a condition being given parenthetically:

Diabetes mellitus (183), arthritis (127), heart disease (87), gout (75), hypertension (61), kidney disease (52), hypercholesterolemia (44), hernia (41), thyroid disease (29), colitis (15), peptic ulcer (7), cancer (3), and other conditions (27).

TABLE 1

Ideal Weight—Women

(For girls sixteen to twenty-seven subtract one pound each year until age twenty-seven. For women, sixty to seventy years, subtract ½ pound each year during this time.)

See next page for Ideal Weight—Men.

Height Without Shoes	Small Bone Structure	Medium Bone Structure	Large Bone Structure
4′8″	95 lbs.	101 lbs.	111 lbs.
4′9″	97 lbs.	104 lbs.	114 lbs.
4′10″	100 lbs.	107 lbs.	117 lbs.
4′11″	103 lbs.	110 lbs.	120 lbs.
5′0″	106 lbs.	113 lbs.	123 lbs.
5′1″	109 lbs.	116 lbs.	126 lbs.
5′2″	112 lbs.	119 lbs.	129 lbs.
5′3″	115 lbs.	123 lbs.	133 lbs.
5′4″	118 lbs.	127 lbs.	137 lbs.
5′5″	122 lbs.	131 lbs.	141 lbs.
5′6″	126 lbs.	135 lbs.	145 lbs.
5′7″	130 lbs.	139 lbs.	149 lbs.
5′8″	135 lbs.	143 lbs.	154 lbs.
5′9″	139 lbs.	147 lbs.	158 lbs.
5′10″	143 lbs.	151 lbs.	163 lbs.
5′11″	147 lbs.	155 lbs.	168 lbs.
6′0″	151 lbs.	159 lbs.	173 lbs.

Compared to control subjects with which they were matched for age and sex, the obese outpatients had a far greater incidence of metabolic derangements, as shown in Table 2. Those more than 50% overweight had a 50-50 chance of having an underlying medical abnormality requiring treatment. At 30% overweight, the likelihood of having such an abnormality was less but still significant. This justifies a physician's having a high index of suspicion of disease in the obese person.

Less than 10% of the obese outpatients had a bona fide medical abnormality that caused their obesity in the first place. The metabolic derangements referred to in the preceding paragraph and in Table 2, while not first-instance causes of obesity, can be regarded as effects of chronic overeating that confirm or promote obesity. Regardless of the cause of obesity, an obese population has an increased prevalence of morbidity and, as various studies have shown, higher mortality rates than the general population.[1] In fact, mortality and morbidity rates increase in direct proportion to the degree of obesity (Fig. 1).

Behaviorally, the outpatients also differed in significant respects from control subjects of normal weight. Of the 541 outpatients, 400 reported that they over-ate when under stress, such as facing an examination, losing a job, arguing with relatives, or hearing bad news. By contrast, the control subjects and 750 of 1,000 non-obese visitors and others queried at random in a hospital said they tended to undereat when stressed.

Most of the obese outpatients had a history suggesting deficient oral gratification in infancy, either insufficient nursing at the breast, insufficient bottle time, or colic. They tended to meet a need for oral gratification by eating (and eating sweets primarily) as well as by smoking cigarettes, pipes,

and cigars. That obesity itself may spur this search for oral gratification may be inferred from the finding, noted above, that obese persons have diminished taste-bud discrimination. Apparently, obese persons do not get enough stimulation from normal amounts of food.

Obesity has marked effects on an individual's psychophysiological performance. My colleagues and I studied 12 obese patients in depth at The Johns Hopkins Hospital, University Hospital of Maryland, and Baltimore City Hospitals. As an example of the psychophysiological decrements found, we will describe performance characteristics of a 30-year-old man who, at 350 lbs., was 100% overweight. Compared to the average performance of 30-year-old men observed in a longitudinal study of aging at the Gerontology Research Center of the National Institute of Child Health and Human Development, located at Baltimore City Hospitals,[2-12] the individual in our study had

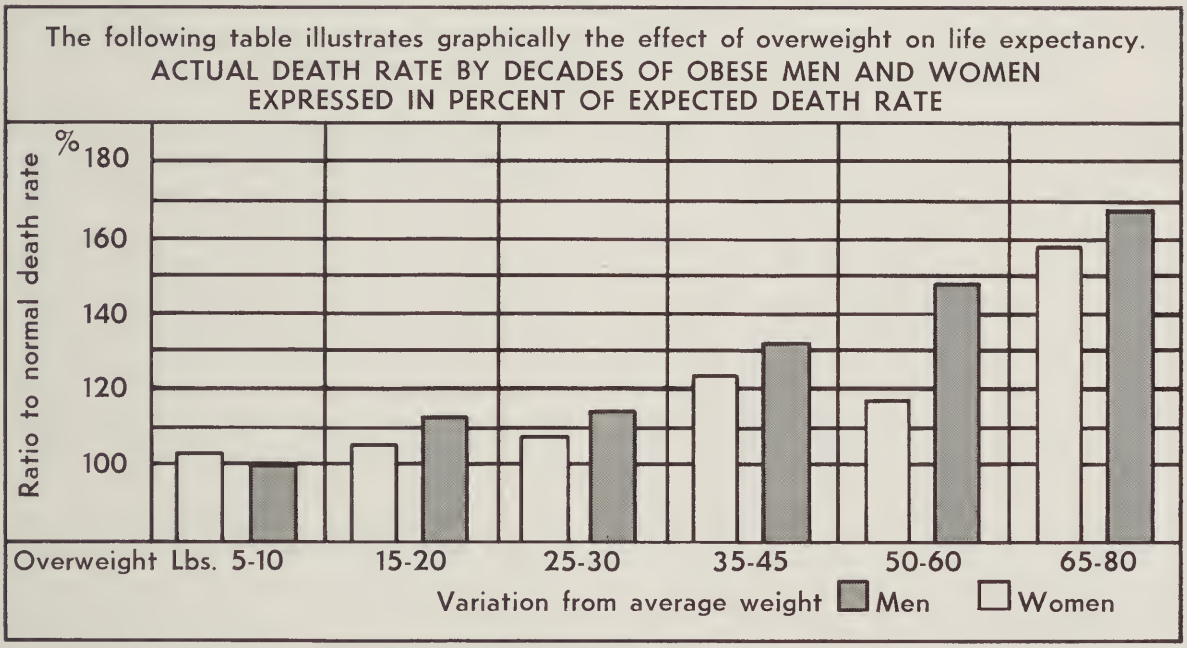
TABLE 2

Incidence of Abnormal Tests in 100 Obese Subjects and 100 Matched Controls at Beginning of Study

	% Abnormal	
Carbohydrate Metabolism	**Obesity Group**	**Control Group**
2 hr. post prandial glucose (>120 mgm%)	37%	2%
Glucose tolerance test, abnormal	63%	5%
Protein Metabolism		
Uric Acid (>6.0 mgm%)	28%	2%
Fat Metabolism		
Free fatty acids (>0.75 mEq./liter)	73%	14%
Steroid Metabolism		
17-Ketogenic steroids Male>25 mgm per 24 hrs. Female>20 mgm per 24 hrs.	58%	1%
Thyroid Function		
Thyroxine-by-column (<3 mgm%)	9%	2%
Basal metabolic (<-—10)	18%	2%
Photomatogram	30%	6%
Food Intolerance	96%	31%

the following percentages of normal function: (These results were not calculated as a function of weight.)



Speed of response on simple psychomotor test, 44%
Cardiac output at rest, 60%
Maximum ventilation on exercise, 25%
Maximum breathing capacity, 25%
Taste bud discrimination, 33%
Maximum work rate, 15%

His psychophysiological profile was startlingly like that of healthy 70-year-old men observed at the Gerontology Center. And average life expectancy for obese persons of this type is 15 years less than that of his normal age peers. From the standpoint of these decrements, obesity may be regarded as a form of premature aging.

This information is conveyed to patients so they may apprehend the hazards of obesity. On the positive side, they are told that as weight is reduced and maintained at normal values, morbidity risks also return to normal proportions. The in-depth studies showed that functional decrements in the 300 lb. man and the other eleven subjects were reversed with weight loss. The outpatient studies pointed in the same direction. In addition, as Table 3 shows, the obese group after one year of treatment resembled the healthy control group in selected indicators of metabolic performance. It appears that there are few concomitants of obesity that cannot be reversed in most patients. (One that cannot be reversed appears to be bagginess of the skin; loss of elasticity seems to be a permanent feature of long-term obesity, although exercise affords some improvement.)

As a prelude to discussing treatment, an elaboration on the relationship of metabolic derangement to obesity is necessary. What is offered is basically speculative. Clinicians are familiar with what our laboratory coined the "Yo-Yo Syndrome," exemplified by the patient who cyclicly loses weight and regains all of it and more. His weight goes up and down, repeatedly. A possible explanation is that an important metabolic capacity is weakened or exhausted while the patient is overeating. Then when he cuts back his caloric intake, his body is unable to metabolize certain foods properly. An analogous situation is illustrated by the diabetic who must decrease his carbohydrate intake because of an absolute or relative deficiency of insulin.

FIGURE 1

The natural history of some hormonal or enzymatic exhaustion in obesity remains to be well documented, but observations in diabetics may indicate a possible approach to study. In some hereditary predestined diabetics increased sugar intake evokes an increased insulin response until the beta cells of the pancreas can no longer keep pace with the high insulin demand. If the overload has persisted too long, the insulin secretion mechanism may be deranged permanently and/or the tissues which are targets of insulin may become

TABLE 3

Incidence of Abnormal Tests in 82 Obese Subjects and 59 Matched Controls After One Year on the Study

	% Abnormal

Basal metabolic rate (<—10)	11%	2%
Photomatogram	7%	7%
Food Intolerance	48%	33%

less sensitive to it. Our observations of endocrine response in progressive obesity suggest that a similar pattern may be present.

Something akin to this may happen enzymatically. The output of the enzymes that split fat may decline in response to persistent "overtaxation," and the patient will lay down fat even on a very low calorie diet. Our laboratory has preliminary data to suggest that 20% of the obese patients studied by the TTZ—Pyocyanine Assay Technic [13]—had reduced blood titers of the liver enzyme butyrl Co-A dehydrogenase which is involved in the oxidation of butyrl Co-A to crotonyl Co-A which is one link in the oxidation of fatty acids. Lack of the enzyme results in a decreased breakdown of fat.

At the moment, it is a chicken-and-egg proposition; whether a particular case of obesity begins with a weakness in the hormonal-enzymatic apparatus or whether obesity induces the weakness. Most probably in the great majority of cases obesity occurs because of overeating. Obesity breeds more obesity in a snowball effect as hormonal and enzymatic systems are broken down in striving to support the enlarged organism. Our laboratory is trying to locate where overloads and failures are likely to occur in the chains of enzymatic and hormonal actions necessary for healthy metabolism. We anticipate such information will permit us to establish profiles of vulnerability to obesity and to pinpoint how obesity snowballs.

The assembling of the study population of 541 patients was begun in 1963. Physicians referred patients with intractable obesity. They were accepted only if they were sufficiently motivated and agreed to continue in the study until ideal weight was attained and stabilized. Most of the patients were from 10 to 100 lbs. overweight, though several were more than 300 lbs. overweight. Seventy-three percent were women and 27% men. By age, the group included 15 aged under 15, 24 aged 15-20, 271 from age 20-45, 219 aged 46-65, and 12 over 65.

Most of the patients studied had been to "weight reduction doctors," who for one reason or another, had not sought or found the medical conditions associated with their obesity. Application of a diet in ignorance of these conditions or indiscriminate use of medication without an adequate history, physical examination, and laboratory tests, is a prescription for failure and even potentially hazardous to the patient. Ideally, the physician should have a complete study of the blood including a hemogram, arterial and venous carbon dioxide, thyroxine-by-column, glucose tolerance, serum electrolytes, cholesterol, urea nitrogen, liver function studies, uric acid, urinary steroids (17 hydroxy and 17 keto-steroids) and qualitative and quantitative amino acid analyses. An electrocardiogram, chest, and skull films should also be obtained. The skull film is included to check for pituitary lesions, such as an eroded sella turcica (found in 2 of the 541 outpatients).

The studies, in addition to a comprehensive history which emphasized personal, family and dietary data as well as a thorough physical examination, were the basis for the treatment of obesity.

In discussions with the physician, the patient was told the progress or lack of progress he was demonstrating in terms of weight reduction and laboratory test results. Dietary adjustments were made depending on medical and laboratory findings and the patient's reaction to his diet. A patient who said he had to have a particular food would be told how to adjust his intake to make "room" for the otherwise proscribed food. A patient who had to have a snack after supper was instructed on how to compensate in his regular meals.

The patient was told that the name of the game was "fewer calories in, more calories out" and was encouraged to exercise. The patient with no weight loss was asked to identify his problem in adhering to the diet. We conveyed our concern with his disappointments as well as satisfaction with his progress. The fact that patients were counseled at every appointment by a physician may have helped them to confirm the seriousness of the weight-reduction attempt.

We do not hesitate to tell patients that anyone who keeps to the diet must lose weight, barring an undetected abnormality. Some "crutches" are offered. The patient can obtain oral gratification at low caloric cost by chewing sugarless gum or drinking fruit flavored diet drinks. Motivation can be helped along by calling the patient's attention to improvements in his condition. Ideal weight and ideal measurements become a goal toward which the patient can see his own progress. Changes in physique are reinforcing for both women and men. Again and again, patients are told that the reward of being able to eat normally awaited their achieving ideal weight and that failure to make progress tended to prolong the risks of obesity. Despite counseling and crutches, some patients could not stay on a diet. Actually, most of the failures dropped out of the study after one or two visits, some voicing resentment that "no magic pill or shot" was offered to do the weight-reduction job for them. It was generally found that the greater the amount and duration of obesity, the less likely was the chance for success. From this plan and the outpatient findings, our laboratory found a means of reconnoitering obese patients for possible treatment in the physician's office practice. The comprehensive history and physical examination, of course, are essential no matter where treatment is given. As a simplified set of screening tests, suggest (1) thyroxine-by-column to determine the titer of thyroid hormone in the blood; (2) two-hour postprandial glucose to determine the level blood sugar; (3) venous carbon dioxide levels as a check for CO_2 retention secondary to extreme hypoventilation; (4) serum uric acid level because of the propensity toward hyperuricemia, in obese patients; (5) serum cholesterol because of the high incidence of hypercholesterolemia associated with obesity; (6) hematocrit, because of the anemia secondary to fad diets; (7) complete urine analysis especially noting any protenuria or ketonuria and (8) respiratory function, simply tested by asking the patient to pucker his lips and blow out a match burning six inches away.

Combined with findings in the history and physical examination, these laboratory procedures provide the physician with a sound basis for prescribing indicated medications, diet, and exercises for most obese patients. The patient should be checked at intervals the physician judges frequent enough to maintain motivation, to keep track of the medical conditions and to establish and secondarily re-inforce good nutritional habit pattern. Where progress is satisfactory, appointment interval maybe lengthened. If despite good eating discipline the obesity proves intractable in the office approach, the patient may require more elaborate observation and treatment as a hospital outpatient in the hands of an endocrinologist with more sophisticated laboratory procedures at his command.

Our final comments are directed to physicians who treat the young. An obese baby is an obese adolescent, an obese adult, and an obese parent whose eating habits spread to his children. Prevention of obesity is essential. The pediatrician may be the professional person with the earliest chance of counseling parents against establishing patterns of overeating in their children. The outpatient study indicates that the desire to eat sweets often stems from an early age when the parent typically offered candy to comfort or bribe a child. In doing so, the parent lit the fuse of obesity. Physicians treating obesity in a parent or future parent may very well be preventing perpetuation of obesity in the young and future generation.

Basic Mechanisms of Transient Ischemic Attacks

The true incidence of transient cerebral ischemic attacks in the general population is not known, but the significance of this phenomenon can be appreciated from the fact that roughly half of patients sustaining permanent neurological deficit from completed extracranial vascular occlusion have experienced transient ischemic attacks for up to six months prior to the catastrophic event.[1] Symptoms may last only seconds or minutes. The patient may minimize them and the physician overlook them when the neurological examination proves negative.

Accurate diagnosis and rational, meaningful therapy of transient cerebral ischemia begins with a high index of suspicion on the part of the physician and an understanding of certain basic mechanisms involved in the production of cerebrovascular insufficiency.

It seems logical then to begin a discussion of basic considerations in transient ischemic attacks with a workable definition which at once delineates the problem and provides insight into the underlying nature of the process involved.

ALBERT F. HECK, MD
Assistant Professor, Department of Neurology,
University of Maryland School of Medicine
Co-director, Stroke Clinic, University of Maryland Hospital

A transient ischemic attack is defined as a temporary dysfunction of one or more parts of the nervous system, without permanent damage to neural tissue, resulting from a temporary discrepancy between the metabolic requirements and the metabolic supply to the tissue concerned, this occurring, at least in part, on the basis of disease of the cardiovascular system. The neurological symptoms and findings with which the patient presents are specifically referable to those areas in which such dysfunction occurs.

Having defined cerebral ischemia in these terms, let us now consider further those factors which are involved in maintaining the balance of metabolic supply and demand in normally functioning brain tissue.

The metabolic supply of any area of the brain is determined 1) by the amount of blood perfusing that area and 2) by the metabolic content of the blood itself.

The average human brain, while comprising less than 2% of the body weight, receives roughly 15% of the cardiac output or nearly 800 cc of blood each minute. Blood flow in the brain, as in any other vascular bed, is determined by the pressure gradient from the arterial to the venous side divided by the resistance across the vascular bed.

$$CBF = \frac{P_a - P_v}{CVR}$$

Arterial blood pressure is the product of the cardiac output times the total peripheral vascular resist-

This work was supported in part by Public Health Service Research Grant No. NB 06779, NINDB. National Institute of Neurological Diseases and Blindness; and was presented as part of the program on "Practical Aspects of Transient Cerebral Ischemia," Baltimore City Medical Society, January 5, 1968.

ance, and cardiac output is in turn the product of ventricular stroke volume times the heart rate. Since it is axiomatic that the amount of blood flowing to the brain is of necessity a percentage of the total cardiac output, it is not difficult to understand why, given a patient with prexisting narrowing of a cerebral vessel, reduction in the cardiac output secondary to myocardial infarction, cardiac arrythmia, myocarditis, severe bradycardia or congestive heart failure, might, and frequently does, present with symptoms and signs of cerebral ischemia referable to that vessel. Likewise, reduction of the total peripheral vascular resistance, such as occurs in shock or with the injudicious use of hypotensive agents, also serves to reduce the perfusing arterial pressure and may result in insufficiency of cerebral blood flow, particularly in areas predisposed by local cerebrovascular disease.

Cerebrovascular resistance is a complexly determined and as yet poorly understood factor in the regulation of cerebral blood flow. Generally speaking, however, cerebrovascular resistance is a function of 1) the rheological properties of the blood and 2) the surface area of the vascular bed-arteries, arterioles, capillaries, venules and veins. Under normal circumstances, it is the cerebral arterioles which contribute most actively to vascular resistance. The constriction or dilatation of these small vessels is therefore thought to be of great importance in the local regulation of blood flow in the brain, since it is by this mechanism that the radius of vessel is altered. Of equal importance is the maximum size of the vascular lumen and the condition of the endothelium lining it. In the presence of pathology of the vessel itself—be this subendothelial plaque, syphilitic panarteritis or collagen vascular disease—narrowing of the lumen results in increased vascular resistance with reduction of blood flow through that vessel. Roughening or disruption of the smooth endothelial lining predisposes to thrombosis. The rheological properties of the blood in cerebrovascular disease have not been thoroughly evaluated, and the role of such factors as blood coagulability have not as yet been studied in transient cerebral ischemia. In certain conditions, such as polycythemia, sickle cell disease and marcoglobulinemia, the effects on blood viscosity and flow properties are obvious factors contributing to reduction in blood flow.

Obstruction of blood flow to brain tissue can occur anywhere from the great vessels in the thorax to the smallest ramifications of the vascular tree in the brain parenchyma itself. In the extracranial portion of this vascular pathway, ie the carotid and vertebral arteries, stenosis and occlusion occur most commonly at the bifurcation of the common carotid into its internal and external branches and at the origin of the innominate, common carotid and subclavian—vertebral complexes from the aorta in the superior mediastinum. Existing studies on the incidence of stenotic lesions in the great vessels of the upper chest and neck are both interesting and informative. In the Mayo Clinic series of 100 unselected autopsies wherein these vessels were studied,[2] 40% of persons over the age of 50 years had 50% or more occlusion of one or more of the great vessels. Stenosis occurred most commonly at or near the point of origin of the great vessels from the aorta. Gurdjian et. al [3] in angiographic studies of a population of 772 patients with an admitting diagnosis of cerebrovascular disease, found that 167 or 23% had internal carotid arterial stenosis by arteriography and that in these stenosis occurred bilaterally in 65. In another 78 or 10%, internal carotid occlusion was complete and in 9 patients total internal carotid occlusion was bilateral. In another series, Faris et. al [4] performed transbrachial arteriograms on 43 healthy males between ages 40 and 65 years. Twenty-three or 53.6% had arterial lesions, 17 of these in the right carotid, and 10 or 23.2% had lesions in more than one artery. Faris and coworkers found only a slight difference, not statistically significant, between the incidence of arterial lesions in this asymptomatic group and a second group of 68 patients of comparable age with cerebrovascular insufficiency and clinical neurological findings.

These studies point to two conclusions about which we can be reasonably firm. Firstly, stenosis of the great vessels occurs frequently in the general population. Secondly, stenosis occurs in persons who never have clinical manifestations of cerebrovascular disease sufficiently severe to bring them to the attention of the medical profession, as well as in patients with cerebrovascular disease of varying degrees of clinical severity and morbidity.

Such studies suggest that with significant stenosis or even complete occlusion of cerebral vessels, yet another factor, that of collateral circulation, is of critical importance. Collateral circulation to brain tissue occurs 1) in the circle of Willis, 2) between branches of vessels over the surface of the brain and 3) with branches of the external carotid circulation that penetrate intracranially. No anastomoses between vessels occur inside the

brain parenchyma until the level of the precapillary and capillary.[5] Collateral pathways by which one vessel may perfuse the territory usually supplied by another insufficient or occluded vessel are very much subject to congenital anomalous variation as well as to the ravages of disease process.

In the presence of adequate collateral circulation, the patient may experience transient dysfunction or, indeed, no dysfunction at all with reduction of blood flow through a given artery. With poor collateral, the same reduction may well result in permanent dysfunction and death of neural tissue. One can, if one wishes, look upon the entire cardiovascular system simply as the means by which blood is delivered to the capillary. And in this context, the blood may be regarded simply as the vehicle by which metabolites are delivered and waste products carried away from the cells subserved by these capillaries. In addition, then, to the multiple factors concerned in the perfusion of brain tissue by the cerebral blood flow per se, the second consideration of major importance in dealing with cerebral ischemia is the metabolic content of the blood.

The metabolism of neural tissue runs almost exclusively on two substances—glucose and oxygen. The average adult brain in the basal state avariciously consumes 77 mg of glucose and 49 ml of oxygen or 20% of the total oxygen consumption of the body each minute. Furthermore, neural tissue is exquisitely sensitive to deficiencies in its metabolites and, in response to oxygen lack or reduction in available glucose, may do one of two things. It may reduce or stop entirely its normal function or it may become hyperexcitable, the best known clinical example of which is the convulsive phenomenom.

Fortunately, there is a built-in safety margin in the brain with respect to blood flow.[5] Cerebral blood flow may be reduced by up to 50% without occurrence of symptoms, this due to the apparent ability of brain tissue to extract more oxygen than it usually does, as reflected in the jugular venous oxygen concentration, under these circumstances. Beyond this critical level of flow, however, further reduction in flow, barely altering the oxygen uptake, results in dramatic, catastrophic changes in neural function.

Transient reduction in serum glucose or in the oxygen content of arterial blood, such as may occur in lobar pneumonia, may play a role in the etiology of neurological dysfunction in patients with focal involvement of cerebral vessels. Likewise, a reduction in the innate oxygen-carrying capacity of the blood secondary to anemia may be a significant factor.

Because of the singular metabolic requirements of the brain persistence of reduced blood flow, oxygen and/or glucose levels from any cause in the absence of adequate collateral circulation, results in infarction and death of neural tissue in the area concerned. In transient ischemic attacks, by definition, the discrepancy between metabolic supply and demand does not persist long enough to produce permanent damage and the patient recovers from his transient dysfunction. It is to this group of patients, therefore, that adequate measures of diagnosis and treatment are most profitably directed.

A Specialty in Search of Identity*

Over the last few years, the number of patients with chronic diseases (other than the mental diseases) requiring hospital care has increased alarmingly. The number of physicians dealing exclusively with such patients has increased particularly in municipal, state and federal hospitals. Although the physician dealing with such patients must be prepared to care for patients with acute diseases, it is apparent that certain special knowledge is required to give good medical care to patients with chronic diseases. It is our purpose here to look into the origin of some of these older specialties now found to be essential to the hospital care and rehabilitation of patients with chronic diseases.

DOUGLAS CARROLL, MD
Chief, Physical Medicine and Rehabilitation
Baltimore City Hospitals

Psychosomatic Medicine

This special area of knowledge focuses on the interaction of psychological and physiological aspects of all normal and abnormal bodily functions. Although recognition of the interactions of psyche and soma goes back into antiquity, it was not until 1939, with the founding of the periodical *Psychosomatic Medicine* and the publication of Weiss and English's textbook (of the same name in the same year) that this speciality gained formal recognition among physicians.

Unfortunately the recognition that psychological factors are of primary importance in the care of patients with chronic diseases has not resulted in actual application of this knowledge.[1] One recent observer made the following indictment: "In spite of the fact that continuous references are made in hospitals to the necessity of 'meeting patient's psychological needs,' action seems to be predominantly confined on medical and surgical services to repetition of this admonition."[2]

Psychosocial Medicine

Psychosocial Medicine deals with the social factors which may influence people emotionally and intellectually. Possibly these reactions were first noted among soldiers. During the Revolutionary War, a disease called "nostalgia" in which the patient became depressed, passive and weak was described. It was particularly noticed among new recruits.

During the American Civil War, DaCosta's syndrome (which was also a type of neurasthenia) was noted widely among the troops. During World War I "soldier's heart" was described by a number of observers. In World War II, a popular diagnosis was "situation reaction" designating the many emotional responses arising in the setting of war and army life.

Adolph Meyer was one of the first to emphasize the social and culture environment of mental disease in the civilian population. He was interested not only in the social factors which shape the

* *This is the first of a series of notes on "Rehabilitation of Chronic Impairments in Adults."*

social goals and habit patterns of the individual patient, but also in the communities and social settings which influence the production of psychiatric disorders in certain populations. He recognized social "sore spots" such as alcoholic and syphilis-producing communities. He emphasized the effect of communities with "insufficient hygiene of work and recreations" which are even now being identified among the urban slum dwellers.[3]

The hospital also has been associated with depersonalization of the patient, fractionation of service and loss of ideal patient-physician relationships. Interest in this field has been centered largely in mental hospitals. The impact of the hospital environment, the hospital hierarchy, the nurses and other patients on the sick person has been shown to be of substantial importance in the outcome of the patient's management.[2,4] Some studies have placed emphasis on social and cultural forces at work,[5] others on psychological considerations.[6] The use of the hospital as a therapeutic environment has been best developed in mental hospitals,[7] but can be extended to General Hospitals [2] as well as to Departments of Rehabilitation.[8]

The strategy of changing the environment of hospitals, in the interest of improved medical care, has been discussed in a number of excellent publications.[2,9,10]

Patient Care Research

This unlikely name is applied to the study of the personnel, institutions, organization, administration, financing, payment, economics and objectives of the entire system of health services.[11] Formally organized in Atlantic City in May of 1961 by physicians interested in rehabilitation and hospital out-patient clinics, its purposes have rapidly become clarified; it has been accepted as a sub-section of the American Federation for Clinical Research, and has had several national meetings. Spurred on by federal government involvement in payment of health programs and by full-time physicians with heavy teaching and patient care responsibilities, this new movement shows promise of upgrading the academic acceptability of caring for patients, illuminating and guiding the administration of health services, as well as increasing our knowledge of ecology and medical sociology.

Physical Medicine and Rehabilitation

Physical Medicine originated as a specialty in Physical Therapy Departments and at Spas. The preoccupation was with physical modalities such as heat, water and diathermy. The inclusion of muscle testing and exercise was necessitated because of the large number of patients with poliomyelitis treated in Departments of Physical Therapy. Next came the emphasis on activities of daily living, vocational rehabilitation and home evaluation.

The concept of reconstruction enunciated by Billings [12] in 1919 does not differ greatly from the present day concept of rehabilitation except that it is now widely applied to civilians and children:

> "The policy of the medical department for the physical reconstruction of disabled soldiers, and later extended to disabled sailors and marines, was formulated on August 9, 1917, applied in some of the general military hospitals early in 1918, and approved by the War Department July 29, 1918. (Physical reconstruction is defined as) continued management and treatment carried to the fullest degree of maximum physical and function restoration, consistent with the nature of the disability, by the employment of all known measures of modern medical management, including physical therapy, manual and mental work and recreational play."

As the concept of rehabilitation has enlarged from a third phase of medicine centered in a rehabilitation hospital to a bedside attitude, potentially needed by all types of patients, it has been captured by other specialties such as orthopedics, psychiatry, neurology, plastic surgery, speech and hearing, by physicians expert in these specialties. The successful invasion of the field of rehabilitation by a number of other specialists has increased the importance of the physiatrist in teaching and in developing new techniques of wide application, as well as working with special rehabilitation problems in the rehabilitation hospital. The new concept of rehabilitation is well expressed by Bonner.[13]

> "Rehabilitation of the chronically ill and disabled is not just a continuous series of restorative technics and procedures but actually a philosophy of medical responsibility."

Geriatrics

Sir John Floyer published his text *Medicina Gerocomica* in 1724, but a specialty of Geriatrics was not seriously urged until the 1940's. *Geriatrics* and the *Journal of Gerontology* were started in

1946 and the *Journal of the American Geriatrics Society* in 1953.

Many geriatricians are concerned with the care of institutionalized elderly patients and are intimately concerned with the complications of arteriosclerosis, neoplasms, prostatic disease, "chronic brain syndrome," as well as the family and social problems of the elderly. Other physicians, often dealing with ambulatory elderly patients, feel that geriatrics is becoming the heart of internal medicine.

In Great Britain, particularly, the specialty of Geriatrics has been highly developed to deal with the large numbers of elderly patients coming to the hospitals.[14]

Chronic Diseases

The first issue of the *Journal of Chronic Diseases* in January, 1955, noted that one-half the patients with chronic diseases are under 45.[15] Two points were made: First, that much that could be done for patients with chronic disease was not at present being done and that more research was needed in the natural course of disease. Secondly, the Journal editors expressed their interest in *prevention* as being the logical approach to chronic diseases. They expressed their interest in the beginnings rather than the end stages of chronic disease, thereby differentiating their interest from that of Geriatrics.

Medical Sociology

It is apparent that all the above mentioned trends are more or less sociologically oriented in a far more sophisticated manner than was evident in medical care even a decade ago. The number of sociologists interested in health problems is increasing. The *Journal of Health and Human Behavior,* started in 1960, deals with social factors in health and disease. A growing body of literature deals with the physician or the hospital as a sociological phenomenon.[16, 17] In addition, there are innumerable publications on government financing of medicine and socialized medicine in various countries.[18] These purely sociological treatises, however, are beyond the intent of this article. There is an excellent summary of recent trends of sociology and social work in relation to health in Paul Lazarsfeld's *Uses of Sociology.*[19]

Comprehensive Care

This movement in medical care is much more vague than some of the specialties mentioned above. Sometimes the word "comprehensive" is used to designate psychiatric or psychosomatic clinics on the theory that the use of the words "psychiatric" or "psychosomatic" might scare the patient away.

Generally, however, the term is used to infer that all specialties, techniques and facilities are available and applied as needed to each patient. In addition to the usual medical disciplines; physical, occupational, speech and hearing technicians, social service, psychological and vocational testing, and visiting nurses are generally involved. Facilities for acute care, surgery, rehabilitation, chronic care, and home care programs are understood to be available.[20]

This type of care is appropriate for patients with multiple medical, psychosomatic, social and vocational impairments of a chronic nature.

Some authors[21] have emphasized the importance of integration of existing community facilities in the rendering of good medical care.

One group of workers has denied categorically that the team approach is the essential feature in comprehensive medicine. Where the team is needed, it should be used. Comprehensive medicine is patient rather than disease oriented. "Comprehensive Medicine, then, is the conviction, born out of experience, that the medical care of patients can be improved now by the utilization of psychodynamic knowledge and sociological knowledge, along with generally available biological skills."[20]

Specialties often arise in universities with emphasis on theory—understanding—analysis—narrowness—deepness. This is important for an academic-research approach to rehabilitation, but our emphasis in these notes will be toward treatment—practicality—simplification—synthesis—breadth.[22] Our major beliefs are as follows:

☐ **The rehabilitation movement is an attempt to emphasize an important aspect of medicine which in the past has often been neglected. We will emphasize *performance* of the patient as a central preoccupation and goal in medical care. Rehabilitation is concerned with physical, mental, social and vocational *performance.* Although diagnosis is the necessary beginning point of medical care, the logical aim is maximal performance in all spheres of human activity.**

☐ **The increasing number of elderly patients, patients with complex social problems, patients with automobile and industrial injuries, calls for comprehensive evaluation using para-medical personnel and social agencies to bring about maximal performance.**

☐ Rehabilitation is not a separate third stage of medical care but is an essential ingredient of every doctor-patient encounter.

☐ Although there are patients who need the special facilities of a rehabilitation center and the skilled care of a physiatrist, the great bulk of rehabilitation must be carried on by the patient's personal physician or a specialist who is not primarily a physiatrist.

☐ There is growing interest, in response to the growing need, in classification of patients into functional categories based on what the patient is able to do for himself. These classifications are now being widely used in patients with heart disease, chronic obstructive pulmonary disease and arthritis. Criteria for classifying patients' performance are important and are being emphasized.

☐ Finally, we would plead with all our power that rehabilitation is not an isolated endeavor: It should not be isolated geographically; it should not be isolated intellectually into anybody else's specialty; it should not be isolated temporally into a third stage of medicine. In brief, rehabilitation is best given at the place where physician and patient meet, by the physician, now. The physician is not required to supply all the patients' medical needs alone: He must recognize areas which may need further investigation and treatment by people skilled in these problems. Throughout his care of the patient, the physician must be neither merely a technician nor a coordinator; he must maintain major concern for the patient as a person.

Your Medical Faculty at Work

JOHN SARGEANT

Executive Secretary

The Council of the Medical and Chirurgical Faculty of the State of Maryland at its March 28, 1968, meeting took the following actions:

1. Rescinded 1967 dues for one physician and reinstated him to membership at the request of his component society.
2. Rescinded 1968 dues for three members on account of illness and in accordance with Article III, Section 7, of the Faculty Bylaws; all at the request of the individual component societies.
3. Recommended Emeritus Membership to the House of Delegates for three members, all at the request of the Component Society involved.
4. Ratified Physicians' Defense for several members who had requested it.
5. Heard of the dismissal of three cases, all without any payment by the physician concerned.
6. Regretted its inability to provide defense for one physician who requested it. This was because of late payment of dues for the year in which the alleged offense occurred.
7. Adopted a recommendation of the Finance Committee that the funds available in the Coggins Building Fund be invested in securities managed by the T. Rowe Price Company.
8. Also heard from the same Committee that the current balance in the Educational Fund was $67,200; and the value of the Faculty's current investment portfolio was $954,823 as of December 31, 1967.
9. Adopted the following recommendation of the Professional Medical Services Committee:

   "That payment for Title 19 patients for professional services rendered patients in in-patient and in outpatient departments of hospitals be made on the basis of Usual, Customary and Reasonable fees until such time as the funds appropriated for these purposes are deleted.

   "It is also expected that services will not be withheld by physicians when such a point is reached. However, it should be understood that physicians will continue to submit bills even though payment may not be received for those services rendered to patients who have been certified by the State agency as being eligible for medical care services for whom the State under its Medical Assistance Program has assumed full financial responsibility."

   It was made clear that this adoption of a position does not involve the home and office visit program.

10. Adopted the following recommendation of the Occupational Health Committee:

    "The Medical and Chirurgical Faculty of Maryland supports the principle that industry requiring pre-employment chest X-rays should be encouraged to contract with a private Radiologist whenever possible. The Health Department and the Maryland Tuberculosis Association should discourage the use of their facilities by industry for pre-employment X-rays where it is felt that such an arrangement with a private Radiologist is feasible."

11. Adopted a unanimous decision that the Governor should be asked to veto House Bill 574, which requires physicians to prescribe generically in all "grant" programs operated by the State Health Department.
12. Approved support of the AMA position on HR 14816, the Occupational Safety and Health Act of 1968; and approved sending letters to Maryland's Congressional Delegation advising them of this.

13. Considered at great length a position in connection with the Title 19 (Medicaid) program and adopted the following:

"The Council of the Medical and Chirurgical Faculty of the State of Maryland, at its January, 1968, meeting stated it would clarify at its meeting in March, 1968, its position in regard to the Medicaid program, after the conclusion of the 1968 General Assembly session.
"Inasmuch as the Governor and the Legislature have failed to meet their obligations to those citizens for whom the State has assumed financial responsibility, by not appropriating sufficient funds to provide for their medical care, the Council cannot endorse either the present or proposed Medicaid program."

14. Requested the appropriate Faculty representatives to meet with their counterpart representatives in other groups providing services under the Medicaid program; and to prepare comments on the report of the Ad Hoc Health Planning Committee to the Governor for transmission to the Governor and the Committee.
15. Declined to lend the Faculty's name to a proposal to sponsor a press conference dealing with armor vests and battle helmets used by U. S. Armed Forces personnel in Viet Nam.
16. Agreed to take a stand against House Bill 274, a Hospital Licensure Law and request the Governor to veto it.
17. Approved the principles contained in a statement dealing with a Health Manpower Study to be discussed at a Subcommittee meeting in connection with a proposed Third Medical School in Maryland.

Semiannual Meeting

of the

Medical and Chirurgical Faculty of Maryland

September 6th and 7th

TUBERCULOSIS SECTION

A Service of the Maryland Tuberculosis Association

Ever since the demonstration of a bacillus as the cause of tuberculosis there has existed a strong and universal fear of the disease as being highly contagious. Along with this an elaborate system of precautions to protect the healthy individual from infection has developed.

Infectiousness of Tuberculosis

Within the past 20 years the advent of effective chemotherapy, more precise knowledge of the mechanism of transmission, and practical ways of disinfecting the air have minimized the risk of infection. But the attitudes toward contagion and the practices used in handling tuberculosis patients have not kept pace.

It has seemed appropriate, therefore, to re-evaluate present practices in the light of current knowledge and experience.

The tubercle bacillus is a non-motile organism which is readily killed by heat, drying, sunshine and ultraviolet light. It is transmitted from one person to another by air in the residues of minute droplets of moisture produced during coughing, sneezing, laughing, etc. The larger particles fall to the ground close to the expeller. The small ones, however, rapidly evaporate, leaving "droplet nuclei" which remain suspended in the air indefinitely and are carried by air currents as is cigarette smoke. Inhalation and implantation on lung tissue of these bacillus-laden droplet nuclei are necessary for transmission to be completed.

As a rule, only the more minute particles are able to penetrate into the lungs. When larger particles are inhaled, they are stopped in the nasal and upper respiratory passages and eliminated. Even though laden with tubercle bacilli, these particles do not infect because the upper respiratory tract is resistant to infection. Bacilli must reach the susceptible lung tissue, settle out, survive and multiply before infection develops.

Available evidence suggests that tubercle bacilli lodged on fomites—linen, furniture, books, and floors—do not constitute a significant infection hazard. Most of them die quickly through the action of drying, heat, or sunlight. Dried secretions are very difficult to fragment and suspend in the air, and furthermore, those airborne particles which do arise from surfaces are ordinarily innocuous. They are too large to penetrate into the lung. Hand washing is efficient in removing organisms possibly picked up from fomites or direct contact with infectious sputum or other discharges.

Breaking the chain of transmission of bacilli from person to person has two aspects: 1. prevention of contamination of the air, and 2. elimination of contamination once it has occurred. Simple, inexpensive procedures can accomplish both of these objectives.

Prevention of Contamination

This requires preventing the known case of tuberculosis from excreting bacilli into the atmosphere. The most effective tools for achieving this are:

Chemotherapy. The antituberculosis drugs ordinarily reduce the cough and sputum of tuberculosis patients within a matter of days. Within a few weeks the excretion of tubercle bacilli is usually halted. Chemotherapy is thus very effective in reducing the hazard of transmission of tuberculosis from the patient to others. The occasional patient with drug-resistant organisms constitutes a special problem since he may continue to excrete tubercle bacilli.

Covering of Nose and Mouth by the patient when coughing, raising sputum, sneezing, laughing, etc. This is an effective procedure for preventing atomized secretions from becoming airborne. Thus the transmission chain is broken at its source. Of course, all raised sputum should be expectorated into tissues, placed in special containers and burned, or flushed into the sewerage system.

Decontamination

The aim of decontamination is to remove from the air any tubercle bacilli excreted by the patients into the air. Decontamination should be applied particularly to places where people with unknown or unsuspected tuberculosis are apt to be present. This includes emergency and admitting rooms of general hospitals and clinics. It also includes rooms used by patients until their chemotherapy has become effective.

Ventilation. The concentration of organisms in the air of a room and hence the likelihood of inhaling them are reduced if the room is well ventilated. Good ventilation is recommended but is ordinarily much slower than ultraviolet light in reducing the concentration of airborne organisms.

Ultraviolet light. The use of ultraviolet lights is an additional valuable procedure for disinfection. Studies have shown that the air of tuberculosis patients' rooms can be rapidly made noninfectious by irradiation with ultraviolet light. Techniques for checking the sterilizing efficacy of an ultraviolet installation are now available. Ultraviolet lights should be used in rooms which are likely to be frequented or occupied by patients with undiagnosed or unsuspected tuberculosis, and by diagnosed patients in the early phase of chemotherapy; and in air ducts when air is being recirculated.

Such installations are effective not only against tubercle bacilli, but also against other organisms responsible for intra-hospital infections.

Gowns and Masks

The use of gowns by personnel as isolating mechanisms in airborne infections such as tuberculosis is ineffective and not called for. Neither are masks indicated for personnel except in instances of intimate face to face contact. If anyone is to be masked, it should be the patient. Masking him is indicated only if his condition is such that he is unable to control or unwilling to cover his cough.

Non-pulmonary Tuberculosis

Since the discharges from body area afflicted with non-pulmonary tuberculosis do not become airborne, the danger of infection from such sources is remote. Of course, if active pulmonary tuberculosis is also present, the principles outlined are applicable.

The Undiagnosed and Unsuspected Case of Tuberculosis

It should be made clear that the greatest risk of infection arises from the individual with undiagnosed or unsuspected tuberculosis. A very important safeguard for hospitals in this situation is a consistent program of tuberculin testing and chest X-raying of all employees who may be subject to exposure, and of all hospital admissions.

Prepared by the NTA Ad Hoc Committee on Treatment of TB Patients in General Hospitals.

Richard L. Riley, MD

Approved May 21, 1967, by the NTA Committee on Guidance of the Tuberculosis Program and the American Thoracic Society Executive Committee. Accepted by NTA Board of Directors on May 27, 1967.

ALCOHOLISM SECTION

"Prevention and Treatment of Alcoholism: Impracticable—Low Priority Program"*?

"The private physician, through organized medical societies, can play a key role in the development of a sound program for alcoholics. A leadership role is available for the medical profession. The question now before us is 'Are we ready and willing to accept the challenge?' "[1]

As of now, we are not. Physicians are too plainly absent from the groups that have labored with chronic alcoholics. Even "the community, or at least its public health officials, has paid no attention" to the problem.[2] Why this apparent neglect?

JOHN B. De HOFF, MD, MPH
Assistant Commissioner of Health
Director Local Health Services
Baltimore City Health Department

Public health heads reluctantly into a sea of troubles as it takes on what is called control of alcoholism. Most good control measures prevent or slow disease development. In chronic alcoholism, though, it is not control but it is treatment. Treatment of homeless, penniless men and women with little hope and little motivation; treatment of others who may have homes and some money, but with whom other therapists have failed. Little wonder that public health agencies shy from undertaking a venture with high patient volumes, heavy total program costs, low recovery rates and conflicting community expectations.

In the past, governments have given their health agencies sizeable budgets to deal with acute and communicable diseases that immediately threatened a community, or to manage chronic diseases that needed long-term care in isolation or protective custody. Chronic alcoholism by definition might easily fit into the latter class.

Patients with chronic diseases went to institutions in which they often got inexpensive and inexperienced care, where they got out of the public scene, and where they occasionally got well. High admission and low discharge rates led to higher occupancy rates and to greater total costs. Budgets were cut or pared by reviewers who knew the price of everything but the value of nothing. Although good chronic care centers today have strong rehabilitation and community involvement elements, it was not always so. In the short run, it may have seemed better to let these institutions remain as storehouses, holding merchandise for occasional re-issue after repair work had made it workable again.

Hazards like these still face public health's new alcoholic rehabilitation units—hazards which arise from an as yet poorly understood chronic

* Mytinger, Robert E., DrPH: "Mandates for Change in Local Health Departments," Public Health Reports 81:437-448, 1966.

illness. Past experiences with similar centers warn of troubles which may result from underbudgeting, from staffs with too little training or inadequate numbers, and from the community's failure to remain involved and concerned with the people who suffer from this condition. In the long run, without good rehabilitation practices and effective preventive efforts, these types of curative or caretaking centers are more costly than even their budgets indicate.

Several sets of conditions helped public agencies virtually eliminate certain costly illnesses. Each of the conditions listed below has more than once met strong and bitter opposition by patients, community groups or even by physicians. Judge for yourself if these techniques can work to control alcoholism now.

- A clear disease definition helps in diagnosis, proves it to authorities, and identifies it to the patient and to friends and strangers as a grave and imminent threat to the community. Everyone concerned with these diseases has been trained to impose or accept stringent sanctions such as separation, isolation, and vigorous treatment, for the general good.

- Carefully conducted research shows close cause and effect relations which can easily be interrupted. Contaminated and infected water supplies carry typhoid or cholera. Mosquitoes from unpleasant puddles carry malaria or yellow fever. Personal desires may override any control measures, as in venereal diseases.

- Public agencies can apply a simple inexpensive procedure, or require that it be applied to all persons regardless of socio-economic status. No individual is singled out for this attention, and indeed he may unknowingly receive the remedy. Chlorination or fluoridation of water supplies, or mandatory vaccination against smallpox, are examples.

- When conditions such as ophthalmia neonatorum, congenital syphilis, poliomyelitis and phenylketonuria affect true innocents, the public compassionately responds with laws or dollars needed for control.

- Acute disease states have no advantages for the sick person or for any others. The patient may suffer some permanent damage or even die, his family is disturbed and may also become ill, and his employer must carry on without him or with an inexperienced substitute.

Alcoholism, unfortunately, has few characteristics of diseases which public health measures control so well. It is not a clearly defined illness. Patients and doctors avoid the diagnosis and acute general hospitals avoid the patient. A clear cause-effect relationship has not been generally accepted. No simple remedy or prophylaxis is at hand. Patients derive some advantage from the illness. Both merchants and government profit from sales of alcoholic beverages. Alcoholism is not recognized by other citizens as contagious. And, lastly, the alcoholic is seen as weak willed and as responsible for his own plight.

Recent court decisions directly affected Maryland (U.S. Court of Appeals, fourth circuit) when they held that public drunkenness is no longer a crime but a concern of the health professions, private and public. Here is a new field wherein experience gained from research and work in preventable disorders of organized communities qualifies medical professionals for a position of leadership. Good administration by public health officials will follow a familiar path: Define the local problem, measure its intensity and distribution, identify factors which affect it significantly, and evaluate forces at hand to cope with it. With the problem described and the opposing forces estimated, the health agencies then select an attainable goal.

Although care and treatment of chronic alcoholics seems a reasonable objective today, many problem areas need clarification if we are to proceed from therapy to true control. Among them are the role of alcohol in alcoholism, possible carrier states in such an illness, ambivalent therapists and administrators (and almost everyone else involved with alcoholism, for that matter), and the personal physician's approach to his chronically alcoholic patient.

As long as definitions of alcoholism stress impaired social functioning, damaged health or lost control over consumption, alcohol itself is overlooked as a causative factor. Although causative factors in alcoholism include others than alcohol, it can safely be said about an individual that if he never drinks alcohol he will not become an alcoholic. He may be depressed or anxious or ill in other ways, but he will not be an alcoholic. In a drinking society like ours, where use of alcoholic beverages often benefits the individual or his social group behavior, even accepted social drinking has immediate and long-range risks. These include

drinking drivers, organic disease, psychiatric disorders and the development of alcoholism in one of every 15 persons who drink.[3]

Control of carriers is often an essential public health task. Epidemiologic study of any disease includes a search for possible carrier states and their accurate description. Studies are needed to show if the alcoholism sickness has any carriers who harbor the illness without symptoms but who can pass it on to others who have been free of the disease.

Just as this illness arises from "a complicated interplay of physiological, psychological and sociological factors"[4] so does its control depend on a complex interplay of individuals and agencies, with overlapping or conflicting policies and practices. The same government that directs its public health unit to control and treat chronic alcoholism may also license alcoholic beverage stores or operate its own. Tax monies collected from producers and vendors of alcoholic beverages support other government activities. Government is probably no more ambivalent, however, to its alcoholic citizens than is the medical profession or the general public.

Every physician whose practice could possibly include just one alcoholic should be concerned about the care of his patient whose chronic alcoholism is primary or complicates other diseases. Every physician who treats adolescents or adults should own "Manual on Alcoholism,"[4] an accurate, concise and well-written American Medical Association publication. All physicians should, in principle if not in fact, accept the chronic alcoholic as one who may need all forms of therapy in any medical facility of the community.

Finally—this really should be first—physicians have a responsibility to educate and caution the public against the danger of alcohol misuse. Effective disease control requires more than good treatment of current cases. New cases must be prevented by individual prophylaxis and by good public health practices—and alcoholism is our fourth largest public health problem.

As physicians and other health professionals prepare to receive skid-row and other alcoholics now confined to jails, and as public health authorities entreat hospitals to accept alcoholics as ill humans, one might ask from where will come the money to treat them. Health insurance plans now pay for short-term care in general hospitals and in some cases in psychiatric hospitals. Private funds, foundations or retirement plans will cover only a small portion of total expenses. Community public health must look to some form of government funding support, for so many of the identifiable chronic alcoholics are at least medically indigent. One need only to look at records of local public drunkenness jailings to sense the problem size, then to this add the unknown alcoholics who will be glad to use new and good resources. Faced with current shortages of money, personnel and facilities, any alcoholism program will begin with limited means and should expect little rapid improvement.

For the support of our purposes, the licensed beverage industries have an almost untouched reservoir of money, energy and goodwill which need not be viewed as entirely self-serving. "Alcoholism control," properly conducted, need not threaten their enterprise. The term should not be synonymous with nor lead to abolition or prohibition. Any reasonable discussion of control should include positive steps toward safety and improved use, as well as moves to limit the use of alcohol in possibly dangerous circumstances.

The licensed beverage industry has shown interest in the effects of its products on people. Like any other manufacturer, it must always consider possible toxic side effects of what it makes. Sooner or later, a producer is compelled by statute to assure customers that its products are safe. The licensed beverage industry should increase its support of moderate drinking habits, generously endow beds for the treatment of alcoholics in community hospitals, contribute to rehabilitation programs which now suffer from meager funding, and support research programs. Such "consumer service division" activities could have long-range beneficial effects on any drinking society.

Courts encompassing Maryland have handed over a sizeable responsibility for chronic alcoholics to the medical professions. Since physicians have repeatedly defined alcoholism as an illness, the community now expects the medical body to act promptly in an area it has claimed so successfully as its own.

STATE OF MARYLAND
DEPARTMENT OF MENTAL HYGIENE

Isadore Tuerk, MD, Commissioner Kurt Gorwitz, ScD, Statistics Director

The Long-Term Patient

Half of all beds in Maryland's mental hospitals are occupied by patients who have been under continuous care in the same facility for five years or more. As shown in the following table, 64% of these 3,895 individuals were reported to be psychotic. Thirty-eight percent of the 1,420 non-psychotic were diagnosed as retarded, 14.4% have convulsive disorders, and 14.2% were reported to have diseases of the senium. Average (median) age at the time of admission was 32.5 years and is now 52.1 years.

AGE AT ADMISSION

Current Age and Diagnosis	Total	Less Than 25	25-44	45-64	65 and Over
TOTAL	3,895	905	1,981	762	247
Psychotic	2,475	552	1,430	428	65
Less Than 45	459	248	211	—	—
45-64	1,243	255	818	170	—
65 and Over	773	49	401	258	65
Nonpsychotic	1,420	353	551	334	182
Less Than 45	297	225	72	—	—
45-64	605	112	349	144	—
65 and Over	518	16	130	190	182

The reported median length of hospitalization of these patients is 19.6 years. Based on available expenditure figures for this period, this is equivalent to an average cost per person in excess of $25,000. That is, 100 million dollars has already been spent on the care and maintenance of this group. Currently, 6% of long-term patients are released each year with this discharge rate decreasing with increasing length of hospitalization. If this pattern remains unchanged, most of these individuals can be expected to remain hospitalized 15 to 20 more years until their ultimate death. On the basis of current cost trends, this represents an additional expenditure per patient exceeding $35,000.

The number of these long-term patients has declined by approximately 200 annually in recent years and is now at the lowest level. In 1960, for example, there were 5,016 such patients. Further continuing reduction in the size of this group can be anticipated since the number of patients becoming chronic in the hospital is now small. Efforts to accelerate this trend are dependent on the development and expansion of closely coordinated and centrally directed programs to:

- Counter symptoms and conditions leading to long-term hospital stay. (Many patients admitted for acute disturbances eventually become chronic and custodial unless continuing efforts are made to channel these individuals into a functioning, community setting.)
- Release and habilitate inpatients who have been hospitalized for extended periods. (Many of these could be discharged if adequate supportive community programs such as nursing homes, day and night centers and sheltered workshops were available in conjunction with continuing psychiatric services.)

HEART PAGE

Chris Papadopoulos, MD, Editor

A Service of the Heart Association of Maryland

In the presence of established coronary heart disease, successful correction of obesity may decrease the risk of sudden death and congestive heart failure and reduce blood pressure and serum lipid levels. Symptoms of angina pectoris may also diminish with weight reduction. Avoidance of cigarette smoking in subjects with established coronary disease is important to reduce both the risk of sudden death and recurrent myocardial infarction. An individually prescribed program of physical activity in recovered heart attack victims and in individuals with angina pectoris may improve their exercise tolerance and, especially, their psychological attitude.

Recommendations to Physicians Relative to Reducing the Risks of Coronary Heart Disease

In the long-term management of the coronary-prone patient it is advisable to recommend:

■ *Discontinuance of cigarette smoking.* (Cigar and pipe smoking have not been proven to be associated with any substantial increase in risk of coronary disease.)

■ *The avoidance of obesity or its correction if present.* Control of obesity should include not only reduced caloric intake but also participation in regular physical exercise.

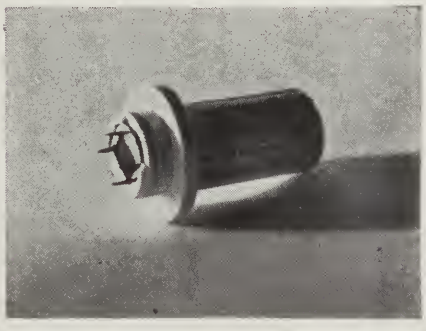
■ *Development of a program of regular physical exercise.* A program of physical activity increases exercise tolerance and improves the psychological outlook of coronary-prone individuals. It may enhance the effect of a modified diet in controlling obesity, hyperlipemia, and the metabolism of carbohydrates. Physically active individuals tend to have a better prognosis when a heart attack does occur. It should be remembered that unusual, strenuous, physical exertion may precipitate a heart attack and should be avoided. Exertion that induces pain or dyspnea should be avoided. In general, unusual exercise shortly after a large meal, when experiencing emotional stress, or in extremely cold or hot weather should be discouraged.

■ *Modification of the diet.* Controversy continues concerning the particular items in the diet that are most basic to the artherosclerotic process. All agree, however, that overeating and weight gain are undesirable. An acceptable way to modify the usual diet, while maintaining sound nutrition, is to restrict the intake of saturated fat, cholesterol, and the simple sugars. Increasing the proportion of polyunsaturated to saturated fat is recommended. Such dietary changes, along with a suitable program of physical activity, may help in correcting obesity, reducing serum lipids, and improving carbohydrate tolerance. The individuals whose elevated lipid levels are primarily influenced by the intake of carbohydrates and/or simple sugars can only be identified by special studies including the clinical trial of a reduced carbohydrate intake.

From a statement released by the Central Committee for Medical and Community Program of the American Heart Association, December 8, 1967.

■ *Correction of elevated serum lipid levels.* According to present knowledge, lowering of serum lipid levels including beta and prebeta lipoprotein, triglyceride, and cholesterol is best accomplished by alteration in diet, correction of obesity, and a program of regular exercise. The use of various drugs and hormones to achieve normal lipid levels is under widespread investigation at this time. Subjects with familial lipid disorders, with a "milky" fasting serum (due to high serum triglycerides), serum cholesterol levels in excess of 400 mg%, or having xanthoma, should be investigated thoroughly, including determination of the several serum lipid components, the function of the thyroid gland, and the carbohydrate tolerance, as well as other procedures to identify disorders that require special management.

The interaction of blood pressure and lipid levels appears to be particularly important in the development of coronary atherosclerosis. Persons with both hypertension and hypercholesterolemia are at substantially increased risk and especially merit efforts to control both conditions. Here again, prophylactic measures applied in the preclinical phase should be more rewarding than those applied after the development of myocardial involvement.



■ *Avoidance of situations which might precipitate acute coronary episodes.* Ischemia of the myocardium may be precipitated by intense emotional states, ingestion of an unusually large meal, unaccustomed strenuous exertion, and unusual exercise in very cold or very hot weather.

■ *Correction of disease states which may predispose to or may precipitate coronary heart disease.* It is recognized that anemia, hyperthyroidism, aortic valvular disease, pheochromocytoma, paroxysmal tachycardia, hypotensive episodes, hypoglycemia, certain drugs (epinephrine, hydralazine), and reactions to drugs may precipitate acute ischemic episodes.

Nutritional, hygienic and medical therapeutic measures are useful in the management of hypertension, diabetes, and gout. Pharmacological treatment is generally employed in these conditions when nutritional and hygienic measures are ineffective. Evidence indicates that even minor impairments associated with these diseases can have grave significance in individuals who are otherwise predisposed to coronary disease.

To fight TB- find it first!

Make tuberculin testing routine with every physical examination.

TUBERCULIN, TINE TEST (Rosenthal)

Side effects are possible but rare: vesiculation, ulceration, or necrosis at test site. Contraindications: none, but use with caution in active tuberculosis. Available in 5's and 25's.

BALTIMORE CITY HEALTH DEPARTMENT

Robert E. Farber, MD, MPH, Commissioner

A three-pronged attack is now underway in Baltimore City to reduce the high rate of illegitimacy among school-age girls—a rate which results in about 1,000 out-of-wedlock births a year in girls 16 years of age and under.

Preventing Teen Pregnancies

In 1967 the Baltimore City Public Schools instituted a new Family Life Education curriculum designed for use from kindergarten to grade twelve. This program of Family Life Education, now being implemented, represents the culmination of planning and experimentation in sex education—family living programs that have gone on for over a decade.

As early as 1956, Lillian B. Davis, ScD, then Supervisor of Health in the public schools, provided leadership and training in the area of sex education. Elective courses were instituted in several schools at the secondary level, and Parent Education Institutes were conducted for PTA's to help parents with problems of adolescence. According to the Curriculum Guide, the ultimate objective of Family Life Education is to help the individual achieve maximum physical, intellectual, emotional, social and spiritual growth in order to live harmoniously with members of his own and the opposite sex and to fulfill his role both as a person and as a dynamic force in the family life of his time. As noted in the Guide's introduction "Sex education, as part of Family Life Education, includes more than the facts of reproduction. Of greater importance is the development of attitudes toward the roles of sex and their psychological, social and economic implications."

A second and more community centered program, "Operation Save A Girl" is under the joint sponsorship of the Maryland League of Women's Clubs, the Baltimore City Health Department and the Monumental City Medical Society. A preliminary conference held January 27 focused on providing insights to the problem of teen-age pregnancies and served as a meeting ground for over 50 representatives of interested community agencies to begin the design of a plan to reduce such pregnancies. Conference speakers included Mayor D'Alesandro, Matthew Tayback, ScD, Deputy Commissioner of Health; Simon Messing, PhD, Cultural Anthropolgist, and Mrs. Vivian Washington, Principal of School No. 1 for pregnant girls. A panel discussion "Design for Prevention" completed the program. Private physicians, educators, and social welfare representatives aided in providing direction for this approach to preventing teen-age pregnancies.

Plans are now underway to develop an action program to reduce adolescent first pregnancies in a selected area of the city where childhood pregnancy has been increasing during past four or five years. The project will involve community leaders and other residents as well as utilize available community resources. A survey of sex and family planning knowledge of the area is being conducted by VISTA workers under the supervision of the City Health Department. This program seeks to develop new social institutions and reactivate existing social institutions to provide meaningful experi-

ences for girls 10 to 16 years of age so that they have outlets for their energies other than sexual outlets.

Radio Series

The third approach is being undertaken with the assistance of local radio stations. WEBB and WSID are presenting a continuing series of 15-minute programs each Sunday entitled "The Girl In Your Future." Aimed at the girl in school, the series presents personal interviews with inner city girls and young adults who have achieved a measure of success in life enabling the teen-ager to identify with members of her peer group. The program emphasizes the value of education, makes clear the dangers of early boy-girl sexual involvement and stresses the setting of attainable goals which are the stepping stones to economic and family security. The two weekly programs are supplemented by short, personalized spot messages prepared chiefly by inner city residents. "The Girl In Your Future" is broadcast over WEBB, 1360 on the dial, at 10:00 A.M. and on WSID, 1010, at 3:15 P.M. Interviews are conducted by Mrs. Margaret B. Pollard, Health Educator Consultant for Child Health Services. Supervision and production are by the Bureau of Health Information.

Profile of Teenage Pregnant Girl

Mrs. Vivian E. C. Washington, principal of the Edgar Allan Poe School No. 1 for pregnant girls, who is participating in both programs, has made some observations as a profile of the pregnant girl at her school. She has been interested in this problem for the past five years and has been principal of School No. 1 since 1966.

- The girl who becomes pregnant comes from all segments of our society.
- The pregnant adolescent girl represents a wide range in intelligence quotient—eg 63-130 at the Poe School (during 1966-'67).
- The girl is a very frightened girl. She has a poor self-concept, poor self-image and is usually ashamed and unhappy.
- The pregnant adolescent girl is a girl who may have had little opportunity for being successful in school. When given the opportunity and recognizing the fact that somebody does care, the girl becomes motivated to learn.
- The young lady begins to develop a positive self-concept once she feels she is valued, respected, and has an opportunity to be successful in her school work. We must trust her and allow her to assume responsibility.
- There is usually poor communication between the girl and her parents. This may be due to the fact that both parents are working and trying to improve the family circumstances. Most parents want to be good parents.
- The pregnant adolescent girl is usually emotionally insecure needing love and attention. Thus, many sometimes want a baby because they want someone to love.
- The adolescent girl faces a dilemma in morals. Teenagers are expected not to become involved in sexual activities; however, adult society through the mass media encourages such activities.
- The adolescent girl needs the kind of help that will help her become a positive contributing member of society.
- Leaders must respect these girls and must help them to respect themselves. The dignity and worth of every human being should be respected. This is particularly important for the pregnant adolescent girl.

Prompt, professional service 24 hours a day, every day! A complete line of hospital beds, wheelchairs, traction equipment, oxygen, crutches, walkers, commodes, lamps, whirlpools—everything to help patients get well faster.

STATE OF MARYLAND DEPARTMENT OF HEALTH

William J. Peeples, MD, MPH, Commissioner

Concern for uniformity of diagnosis, treatment, and follow-up of phenylketonuria led to the formation in June 1966 of a 24-member *ad hoc* Advisory Committee on Hereditary and Metabolic Diseases, composed of leading pediatricians and biochemists from several hospitals and teaching centers in Maryland and the District of Columbia.

Recommendations Concerning PKU Diagnosis, Treatment and Follow-Up

A Subcommittee on Diagnosis, Treatment, and Follow-Up was established under the chairmanship of R. Rodney Howell, MD, The Johns Hopkins Hospital. Serving as members are: Samuel Bessman, MD, University of Maryland Hospital; Phillip Calcagno, MD, Georgetown University; Kurt Glaser, MD, Rosewood State Hospital; Wilson Grubb, MD, American Academy of Pediatrics; Neil Holtzman, MD, The Johns Hopkins Hospital; Wellington Hung, MD, George Washington University; and Benjamin D. White, MD, Maryland State Department of Health.

The subcommittee has formulated the following statement on phenylketonuria:

"This committee recommends that all infants who have a confirmed Guthrie test indicating a serum level of over 20 mgm % phenylalanine in the newborn period be hospitalized as promptly as is reasonable. The committee emphasizes that accurate confirmation of the diagnosis of phenylketonuria, which may require several days (but should be delayed no more than two weeks) is far preferable to a hasty and possibly incorrect decision to start a low phenylalanine diet. It is essential that hospitalization of such infants be done at facilities where determinations of serum phenylalanine as well as phenylalanine metabolites (such as phenylpyruvic acid, orthodroxyphenylacetic acid, etc.) are quickly available so that diagnosis and possible therapy can be quickly carried out. For practical purposes, this means that such patients should be hospitalized at The Johns Hopkins Hospital or its affiliated hospitals, the University of Maryland or its affiliated hospitals, the Sinai Hospital of Baltimore, or at Georgetown University or George Washington University and their affiliated hospitals in Washington, D. C.

"This committee further emphasizes that it is essential that phenylketonuria be diagnosed *not* on the basis of the Guthrie testing but on the basis of at least two quantitative serum phenylalanine determinations and that under no condition should the low phenylalanine diet be instituted *prior* to the availability of such quantitative serum data."

The committee further recommended that private physicians choosing to follow patients with hyperphenylalanemia in their own offices maintain "very close cooperation" with a laboratory experienced in the necessary determinations, in order that the data and their interpretation may be quickly obtained.

State law requires that all newborn infants (except when parents' religious beliefs contradict) receive the Guthrie screening test before reaching four weeks of age. Institutions where births occur are responsible for seeing that the test is performed; when birth occurs outside of an institution, the person filling out the birth certificate is assigned the responsibility. Laboratories are required to report positive results to the Maryland State Department of Health, which maintains a current registry of each confirmed new case of phenylketonuria. Materials and instructions for making the test may be obtained from the Department on written request.

When it's time for Thorazine® brand of chlorpromazine

...can you depend on less?

For profound calming effect in moderate to severe mental and emotional disturbances of everyday practice.

Before prescribing, see complete information, including adverse effects reported with phenothiazines and symptoms and treatment of overdosage, in SK&F literature or *PDR*. The following is a brief precautionary statement.

Contraindications: Comatose states or the presence of large amounts of C.N.S. depressants.

Precautions: Potentiation of C.N.S. depressants may occur (reduce dosage of such agents when used concomitantly). Use with caution in patients with chronic respiratory disorders. Antiemetic effect may mask overdosage of toxic drugs or obscure other conditions. Administer in pregnancy only when necessary. Because of possible drowsiness use cautiously and warn patients who operate vehicles or machinery.

Adverse Reactions: Drowsiness; dry mouth; nasal congestion; constipation; amenorrhea; miosis; mild fever; weight gain; hypotensive effects, sometimes severe with I.M. administration; epinephrine effects may be reversed; dermatological reactions; parkinsonism-like symptoms on high dosages (in rare instances, may persist); lactation and moderate breast engorgement (in females on high dosages); and less frequently, cholestatic jaundice (use cautiously in patients with liver disease). Adverse reactions occurring rarely, include: mydriasis; agranulocytosis; skin pigmentation; epithelial keratopathy; lenticular and corneal deposits (after prolonged substantial doses).

Available: Tablets, 10 mg., 25 mg., 50 mg., 100 mg. and 200 mg.; Spansule® capsules, 30 mg., 75 mg., 150 mg., 200 mg. and 300 mg.; Injection, 25 mg./cc.; Syrup, 10 mg./5 cc.; Suppositories, 25 mg. and 100 mg.

Are We Well Fed? Who Knows?

CORTEZ F. ENLOE, JR., MD
Editor, Nutrition Today

When one studies the descriptive titles of the grants now being made for research in nutrition and reflects on the nutritional problems faced by large segments of American society, it seems that something's out of kilter. There is a dissonance between what we could be doing with this time, talent and money and what is being done. We don't appear to be applying our material and intellectual resources as well as we might to solve the solvable nutrition problems that face too many children and adults and elderly and poor in our country. It's time to reexamine some of the goals of nutrition research in America.

There is so much talk these days about overpopulation and starvation elsewhere in the world that it is easy to lose sight of the fact all is not well right here at home. When it comes to setting priorities for our talents, we as "haves" are all too often made to feel guilty about the lot of the "have nots" by declaring that since we have such an abundance of food, there is little or no malnutrition in the United States. Every time a ship sails from an American port, laden with grain to fill the mouths of the hungry in some impoverished land, there is a little less inclination to accept the idea that there may very well be malnutrition within our own borders that we could do something about.

If we are honest with ourselves, we will admit there is at least the possibility that too many Americans are not well fed at all. Dr. William H. Stewart, the Surgeon General of the U. S. Public Health Service, in testifying before a Senate committee pointed out that while we had been able to conduct nutrition surveys all over the world, "We do not know the extent of malnutrition anywhere in the United States." Apparently, until recently, we have never been sufficiently motivated to carry out such studies in this country. Thankfully, the Secretary of Health, Education, and Welfare is now organizing a nutritional survey in certain poverty areas of the United States that may throw some light on this dimly lit subject. This is a step in the right direction and it deserves the widest support.

Frederick J. Stare of Harvard, who has done as much as anyone in America to awaken the public to the need for good nutrition, has written repeatedly and lectured from one end of the country to the other on the importance of the implantation of preference for good food in the earliest possible moment of childhood, but just how much preference has thus been implanted? Who knows?

Talk to any grade-school teacher or a perceptive school nurse. Ask them about the number of pretty little six-, seven- and eight-year-olds who trudge to school each morning without breakfast. You will certainly be alarmed at the answer you get. Here is a budding nutrition problem that borders on the scandalous. What is the meaning of this lack of what nearly everyone regards as the most essential meal of the day for these little children who are still growing and who are struggling to learn? What does this do to their ability to learn? What does it do to their present and future health? What can be done about it? Who knows?

One of the best organized studies on the nutritional status of our teenagers has now expired at midpoint, starved from the lack of the two vital foods: motivation and money. Yet what is the nutritional status of our young people? We know that they are undergoing the most stressful period of their lives. We know their food demands are tremendous, and we know they develop all sorts of faulty eating habits. How well nourished are these young children in America? They look healthy. So do the Watusi. But, are our youngsters indeed well nourished? Who knows?

Middle-age obesity is said to be the major illness in our land today. That the clinicians who see obese patients need the help of the nutritionist is evident from the fact that the practicing physicians' record in trying to get a firm grasp on this nettle is less than enviable. Because clinicians don't seem to be able to cope with obesity and it has not been given the attention in research that a national

Reprinted from Nutrition Today/*March 1968*

disease deserves, the quacks and the charlatans have moved in. What can be done about obesity? Who knows?

A little over a year ago, the American people made a commitment to pay for the medical care of our elderly citizens. This is a very large and costly undertaking. Anything that can be done to improve the health of the older people is not only a moral obligation but economically wise. It is, therefore, surprising to find that the list of grants for research this year reveals little curiosity about the nutritional problems of the elderly. Is there anything we know about nutrition that would return some of them to productivity and brighten their remaining years? Who knows?

It is generally accepted that poverty and undernourishment are bedfellows. The economists know where to find the poverty, but can we spot the undernourishment? Considering this parallel, malnutrition is undoubtedly prevalent in Appalachia, in our slums and in certain rural areas. It's not hard to imagine that there are enough interesting problems in these places to whet the intellectual appetites of a small army of nutritionists. But is anybody shipping "Incaparina" to Harlem? What is the effect of this undernourishment on these people, on our economy, on our society? Is it this that freezes them into the hard core of unemployables that so vexes our social planners? To what extent is nutritional status to blame for the predicament of the poor, seemingly uneducable Negro whose plight in this land of plenty is offensive to Christian decency? Who knows?

The time has come when we as physicians, dietitians and nutritionists—scientists all—must ask ourselves whether the people of America are really well fed. We are the only ones who can know. It's time we looked homeward. It's time we found out.

Archer Manuscript Discovered

One of the finds recently located in the collection of the library was a history of the Harford County Medical Society in the handwriting of James Archer. This constitutes a significant discovery in our efforts to collect all possible historical material concerning the component societies of the state and establishing a definitive and original history of Maryland medicine at its sources. It also adds a valuable record to the collection of Archer manuscripts.

Another interesting and very amusing piece discovered in the basement of the building were the minutes, in longhand, of the Bacillus Club, which apparently had some gay and relaxing hours of fellowship. Needless to say, these were not minutes of professional or scientific meetings.

At the last meeting of the Library Committee Mr. Lee Ash met with the members, showed them a few of the important items we have been unearthing, some cataloged and some unprocessed, and recommended future steps to be implemented. Afterward the committee took a 'guided tour' of the library quarters in order to see the magnitude of the job that lies ahead.

the complaining earache... key to serous otitis media

Robert H. Lofgren, M.D.
Associate Surgeon, Massachusetts Eye and Ear Infirmary, Boston, Massachusetts

Serous otitis media is probably the most common ear problem in children, especially in the wintertime. Diagnosis is usually easy in adults, but may be quite difficult in children, especially the very young child where one has to depend almost entirely on the physical findings.

The symptoms of serous otitis are a fullness in the ear, a mild hearing loss and mild earache. The earache can best be described as a "complaining earache" instead of a "screaming earache" as found in purulent otitis media. A young child may be irritable and pull at the ear. In milder cases, and as the ear recovers, gurgling and popping noises can be heard in the ear.

On examination one may see a yellow tympanic membrane and if a fluid level is present the diagnosis becomes easy. However, the eardrum may be dull gray, or slightly pink, or even perfectly normal. Pneumomassage using a Siegle otoscope or a closed-head electric otoscope must be done on both ears, otherwise the diagnosis will be frequently missed. Attempted movement of the drum with the pneumatic otoscope produces either a sluggish motion of the drum or no motion at all instead of the easily movable normal drum. The Rinne test is negative and there is a 15-20 decibel conductive hearing loss. The bone conduction may be better than normal and an air-bone gap may exist even with the air conduction within normal limits. Occasionally one finds a false nerve deafness on the audiogram when thick glue-like fluid causes immobility of both the oval and round window. Both conditions return to normal when the fluid is removed, but they make the interpretation of screening audiograms very difficult.

There is no single cause for serous otitis. One factor always present is blockage of the eustachian tube, but this alone is not enough to produce fluid. There must also be an inflammatory reaction. Blockage of the eustachian tube may be caused by many conditions. In children the most common cause is enlarged adenoids. In the summer the next most common cause is allergy. Upper respiratory infections or influenza are common causes in the winter. Nasal allergy, acute and chronic sinusitis, nasal septal deformity and cleft palate can all cause eustachian tube obstruction. Some children may have a congenitally small eustachian tube, but fortunately they usually "grow out of the problem."

The first sign of a nasopharyngeal tumor is often a serous otitis. One must always rule this out in any adult who later in life develops repeated or persisting serous otitis. Causes sometimes overlooked are nasogastric tubes after surgery, simple obesity and cardiorenal disease, which may produce congestion in the mucosal lining of the eustachian tube. In recent years we have been seeing a new cause—acute otitis media, where the patient is adequately treated with antibiotics but where drainage has not been

established either through the eardrum or down the eustachian tube. A sterile exudate is left in the middle ear.

The inflammatory response may be caused by a marked negative pressure as in air otitis from flying, or it may be from a mild bacterial or viral infection in the middle ear. Serous fluid is a good culture medium and will frequently go on to purulent otitis media, especially if the original blockage was caused by an infectious process such as acute rhinitis or adenoiditis. When the infection heals there may be scarring in the middle ear mucosa. Mucous glands develop in this tissue and pour out a thick mucoid material. This ear usually looks normal until a pneumatic otoscope is used. The objectives in treating serous otitis are to remove the obstructing agent and to provide drainage from the middle ear. Often this can be accomplished by decongestants and nose drops. If large obstructing adenoids are present they should be removed. Sinusitis should be treated with oral decongestants or nose drops, plus antibiotics where indicated. Nasopharyngeal tumors should be treated. Allergies should be treated with antihistamines and, where indicated, by desensitization.

If the fluid does not clear with medical treatment within a week or two, a myringotomy should be done. If there is a question of active infection or if the fluid looks purulent, as is seen at the conclusion of acute otitis, cultures are taken. On adults this can be done in the office without anesthesia. It is no more painful than an intravenous needle for a blood test. A good safe topical anesthetic has a tremendous psychological value to the patient. Children under the age of 1 require no anesthesia. Between the ages of 1 and 3 anesthesia is not absolutely essential although a general anesthetic may be used to avoid the child's possible mistrust at follow-up examinations. I usually do the myringotomy at the same time as the adenoidectomy if the adenoids are enlarged. Once drainage has been established with decongestants or by myringotomy, positive pressure inflation of the middle ear is invaluable in forcing out the serous fluid and keeping it from reforming. The patient can do this himself by performing the Valsalva maneuver. This should be done several times a day, by taking a deep breath, holding the nose and blowing hard against the closed lips for a second or two.

In resistant cases where the fluid reforms as soon as the myringotomy heals, small polyethylene tubes are inserted through the myringotomy site. Insertion of the tubes, even in adults, usually requires an anesthetic. Good anesthesia can be obtained by infiltrating the canal wall with a local anesthetic, using a #27 needle. Once inserted the patient has no sensation of the tubes' presence. Be careful to caution the patient or parents not to allow any water to get into the ear canal while a myringotomy is open or a tube is in place. Water can be kept out by a pledget of lamb's wool in the ear canal or a cotton pledget thickly coated on the outside with petroleum jelly. I check these patients a week after a myringotomy to be sure it is healed and at two month intervals until the tubes have fallen out, usually within three to six months after insertion.

The mucoid type of fluid is so thick and tenacious that it is appropriately called a glue ear. It is aspirated only with difficulty through the eardrum, and occasionally must be removed through a tympanotomy. This thick, glue-like fluid is prone to recur, as the myringotomy usually heals long before the mucous membrane has returned to normal. Repeated myringotomies, as many as ten or twenty, were formerly required for this condition. Now polyethylene tubes are inserted initially when this thick, glue-like material is found. At times a subacute mastoiditis may accompany the serous otitis, which will necessitate a simple mastoidectomy before the condition can be eradicated. Usually the thin serous fluid readily responds to decongestants or to a myringotomy and removal of the eustachian tube obstruction. Occasionally, however, even serous fluid will repeatedly reform. For this, resection of the tympanic plexus of nerves which lies on the promontory of the middle ear has been carried out, as the tympanic branch of the glossopharyngeal nerve is the secretomotor nerve to the ear.

Failure to diagnose serous otitis is the most common cause of the recurrent, almost continuous otitis me-

Otoscopic Views

Normal

Acute Serous

Acute Purulent

Chronic Serous

dia seen in young children. In these cases a myringotomy will frequently provide a long-term cure without adenoidectomy or any other surgery. Failure to do this may allow the condition to go on to acute or subacute mastoiditis. Adhesive otitis media with scar tissue binding down the ossicles or tympanosclerosis may also result with permanent impairment of hearing. The prognosis for hearing with adhesive otitis or tympanosclerosis is usually poor. If the adhesions are removed, they reform, and the same is frequently true of tympanosclerosis even after a tympanoplasty. For many of these people a hearing aid is the only solution. The constant negative pressure in long standing serous otitis media may draw in either Schrapnell's membrane or the posterior superior portion of the eardrum forming a pocket to cause a chronic otitis media with cholesteatoma, which may not become apparent until twenty or thirty years later.

The non-medical complications of improper diagnosis or treatment may be even more serious. The irritable child, the frequent bouts of acute purulent otitis media with pain and fever, the expense of antibiotics and doctors, and the time lost from school or work affect the entire family.

In summary, serous otitis has many causes. There is a blocking of the eustachian tube and an inflammatory reaction in the middle ear mucosa, the latter usually caused by a mild infection. The treatment is to provide immediate drainage by decongestants and where necessary, by a myringotomy. The obstructing agent must be removed by surgery if it is adenoid or by oral decongestants, and antihistamines or nasal spray if it is an upper respiratory infection or allergy. Occasionally resistant cases require plastic tubes placed through the eardrum or other more radical surgery. Failure to treat properly leads to hearing loss which may be permanent, repeated acute otitis media or possibly even chronic otitis media with cholesteatoma.

You can relieve his congestion and sniffles and her concern with

"The Orange Medicine"

You know it as Triaminic Syrup, but mothers of kids with colds and allergies know it as the orange-colored, good-tasting medicine that makes life a lot more livable at either end of the teaspoon. Triaminic Syrup contains not one, but two antihistamines, plus an effective oral nasal decongestant. This balanced formulation has promptly and effectively relieved nasal congestion for so many.

TRIAMINIC® SYRUP

Each teaspoonful (5 ml.) contains: phenylpropanolamine hydrochloride 12.5 mg.; pheniramine maleate 6.25 mg.; pyrilamine maleate 6.25 mg. Side effects: Drowsiness, blurred vision, cardiac palpitations, flushing, dizziness, nervousness or gastrointestinal upsets. Precautions: The possibility of drowsiness should be considered by patients engaged in mechanical operations requiring alertness. Use with caution in patients with hypertension, heart disease, diabetes or thyrotoxicosis. Dosage: Children 1-6, ½ tsp.; Children 6-12, 1 tsp.; Adults, 2 tsp. Administer every 4 hours. Supplied: Bottles of 4 fl. oz., pints.

AAP Cautions Against Unnecessary Public Warnings for Vaccines

The American Academy of Pediatrics has cautioned against "undue emphasis" in requiring public warnings regarding isolated complications or hazards which might result from use of vaccines in mass immunization programs.

Such warnings, the Academy pointed out, "would adversely affect the health of the public by unwarrantably diminishing participation in these programs."

The AAP Executive Board, meeting in Atlanta during the organization's spring session at the Regency Hyatt House, expressed its concern over a recent court decision imposing liability on a drug manufacturer for not warning the public participating in a mass immunization program about remote risks involved in receiving oral poliovirus vaccine.

The Board strongly endorsed recommendations set forth by the Academy's Committee on Control of Infectious Diseases concerning the recent two-to-one decision of the United States Court of Appeals for the Ninth Circuit in the case of Davis vs. Wyeth Laboratories, Inc., Jan. 22, 1968.

Emphasizing the possible implications of this decision upon important public health programs, the Academy, in its statement, pointed to several types of immunization programs that would be affected by the court decision, including those currently administered by schools, public health departments, community health programs such as Head Start, and others.

"The decision may have deleterious effects both on the conduct of, and public participation in, efforts directed against many other infectious diseases such as measles, diphtheria, whooping cough, tetanus, and others," the AAP's statement cautioned. "In the opinion of the AAP Committee on Control of Infectious Diseases, the benefits of these programs are tremendous."

Indications: Tofrānil is recommended for the treatment of depressive states of diverse psychopathology.
Contraindications: The concomitant use of Tofrānil and monoamine oxidase inhibiting (M.A.O.I.) compounds is contraindicated. Hyperpyretic crises or severe convulsive seizures may occur. Potentiation of adverse effects can be serious or even fatal. An interval of at least 7 days after M.A.O.I. therapy has been discontinued should be allowed before Tofrānil may be substituted. Initial Tofrānil dosage should be low, increases should be gradual, and the patient's progress should be carefully observed.
Warning: Clinical reports have suggested that there may be a risk of teratogenesis associated with the use of this compound during the first trimester of pregnancy. Unless, in the opinion of the prescribing physician, the potential benefits outweigh the possible risks, Tofrānil should not be used during the first trimester of pregnancy.
Cardiovascular complications, including myocardial infarction and arrhythmias, have occasionally occurred in susceptible individuals. Patients with cardiovascular disease should be given the drug only under careful observation and in low dosage.
Precautions: Since suicide is always a possibility in severely depressed patients and one which may persist until significant remission occurs, such patients should be carefully supervised during early treatment with Tofrānil. Some severely depressed patients may also require hospitalization and/or concomitant electroconvulsive therapy.
Because of its anticholinergic effect, caution should be observed in prescribing Tofrānil for patients with increased intraocular pressure.
In rare instances, transient cardiac arrhythmias have occurred in hyperthyroid patients and in patients receiving thyroid medication when Tofrānil was added to the regimen.
Imipramine may block the pharmacologic activity of guanethidine and other related adrenergic neuron-blocking agents.
The drug is not recommended at the present time in patients under 12 years of age.
Adverse Reactions: Dryness of the mouth, tachycardia, constipation, disturbances of accommodation, sweating, dizziness, weight gain, urinary frequency or retention, nausea and vomiting, peripheral neuritis, mild parkinson-like syndrome, tremors, rare cases of falling in elderly patients, confusional states (with such symptoms as hallucinations and disorientation), activation of psychosis in schizophrenics and agitation (includ-

When a milestone in life is marred by depression...

Often in the mind of the lonely, widowed, depression-prone individual, she's not gaining a daughter...she's losing a son. The occasion may be marred by depression with such symptoms as feelings of sadness, incapacity, helplessness and hopelessness.

Tofrānil often relieves symptoms of depression.

As maintenance therapy during the active phase of depression, it may help prevent relapse.

The use of Tofrānil in patients receiving M.A.O.I.'s is contraindicated.

In patients with cardiovascular disease, hyperthyroidism or increased intraocular pressure; or in those receiving anticholinergics (including antiparkinsonism agents), thyroid medication, or antihypertensive adrenergic neuron-blocking agents; and in those in their first trimester of pregnancy, the special precautions listed in the prescribing information should be carefully observed.

Toxic reactions severe enough to require discontinuation of Tofrānil are uncommon. However, for complete details, please refer to the full prescribing information.

Tofrānil® imipramine hydrochloride Geigy

ng hypomanic and manic episodes) which may require dosage reduction nd/or addition of a tranquilizer or emporary discontinuation of the drug, pileptiform seizures, orthostatic ypotension and substantial blood ressure fall in hypertensive patients, urpura, transient jaundice, bone marow depression including agranulocysis, sensitization and skin rash ncluding photosensitization, eosinohilia, and mild withdrawal symptoms n sudden discontinuation after prolonged treatment with high doses. ccasional hormonal effects (impotence, decreased libido, and estroenic effects) may be observed. tropine-like effects may be more ronounced (e.g. paralytic ileus) in isceptible patients and in those sing anticholinergic agents (including antiparkinsonism drugs). *utpatient Adult Dosage:* Initially, mg. daily, increased, if necessary, to 150 or 200 mg. Maintenance dosage may be lower, 50 to 150 mg. daily, if possible.

Geriatric and Adolescent Dosage: Initially, 30 or 40 mg. daily, which may be increased according to response and tolerance. It is usually unnecessary to exceed 100 mg. daily.

A lag in therapeutic response, lasting from a few days to a few weeks, should be expected. When dosage recommendations are already being followed, increasing the dosage does not normally shorten this latency period and may increase the incidence of adverse reactions.

Availability: Tofrānil: Round tablets of 25 and 50 mg.; triangular tablets of 10 mg. for geriatric and adolescent use; and ampuls, each containing 25 mg. in 2 cc. for I.M. administration.

When it's more than a bad cold

your patient can feel better while she's getting better

Achrocidin®

Tetracycline HCl—Antihistamine—Analgesic Compound

Each tablet contains: ACHROMYCIN® Tetracycline HCl 125 mg.; Phenacetin 120 mg.; Caffeine 30 mg.; Salicylamide 150 mg.; Chlorothen citrate 25 mg.

In bacterial/allergic u.r.i., ACHROCIDIN brings the treatment together in a single prescription —prompt relief of headache and congestion together with effective control of the tetracycline-sensitive organisms frequently responsible for complications leading to prolonged disability in the susceptible patient.

For children and elderly patients you may prefer caffeine-free ACHROCIDIN Syrup. Each 5 cc contains: ACHROMYCIN (Tetracycline) equivalent to Tetracycline HCl 125 mg.; Phenacetin 120 mg.; Salicylamide 150 mg.; Ascorbic Acid (C) 25 mg.; Pyrilamine Maleate 15 mg.

Average adult dosage: 2 tablets four times daily, given at least one hour before, or two hours after meals.
Contraindications: History of hypersensitivity to any component.
Warning: If renal impairment exists, even usual doses may lead to liver toxicity. Under such conditions, lower than usual doses are indicated and, if therapy is prolonged, serum level determinations may be advisable. Hypersensitive individuals may develop a photodynamic reaction to natural or artificial sunlight during use. Individuals with a history of photosensitivity reactions should avoid direct exposure while under treatment, which should be discontinued at first evidence of skin discomfort.
Precautions: Some individuals may experience drowsiness, anorexia, and slight gastric distress. If excessive drowsiness occurs, it may be necessary to increase the interval between doses. Persons on full dosage should not operate any vehicle. Use may result in overgrowth of nonsusceptible organisms. If infections appear during therapy, appropriate measures should be taken. Infections caused by beta-hemolytic streptococci should be treated for at least 10 full days to help prevent rheumatic fever or acute glomerulonephritis. Use of tetracycline during tooth development may cause discoloration of teeth.
Adverse Reactions: Gastrointestinal—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. Skin—maculopapular and erythematous rashes (a case of exfoliative dermatitis has been reported); photosensitivity; onycholysis and discoloration of nails (rare). Kidney—rise in BUN, apparently dose related. Hypersensitivity reactions—urticaria, angioneurotic edema, anaphylaxis. In young infants, bulging fontanels following full therapeutic dosage has been reported. This has disappeared rapidly when drug was discontinued. Teeth—dental staining (yellow-brown) in children of mothers given tetracycline during the latter half of pregnancy and in children given the drug during the neonatal period, infancy, and early childhood. Enamel hypoplasia has been seen in a few children. Blood—anemia, thrombocytopenic purpura, neutropenia, eosinophilia. Liver—cholestasis (rare), usually at high dosage. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy.

WOMAN'S AUXILIARY

Mrs. Harry L. Berman, Editor

AMA Auxiliary to Hold 45th Annual Convention

Conducted tours through a unique rehabilitation mobile unit and an afternoon of continuous health education films will be new features at the 45th Annual Convention of the Woman's Auxiliary to the American Medical Association. Headquarters for the June 16-20 meeting will be the St. Francis Hotel, San Francisco, Calif.

Highlighting the four-day session will be the new mobile demonstration unit called "Homemaking Unlimited." This five-ton coach, sponsored by the School of Home Economics of the University of Nebraska, shows handicapped housewives how they can be self-reliant homemakers despite physical limitations. During the convention the unit will be displayed on Powell St., across from the St. Francis Hotel.

On Sunday, June 16, the Auxiliary will hold a reception for the president, Mrs. Karl F. Ritter, Lima, Ohio, and president-elect, Mrs. C. C. Long, Ozark, Ark., from 5 to 7 P.M.

The convention will formally open at 9 A.M., Monday, June 17. Mr. Philip Lesly, president of The Philip Lesly Co., a Chicago-based public relations firm, and counsel on PR and communications to the AMA, will deliver the keynote address.

The Monday luncheon will honor the leaders of women's volunteer organizations throughout the United States. Featured speaker will be Henrik L. Blum, MD, Clinical Professor of Community Health Planning, University of California School of Public Health. Dr. Blum will discuss "Program Planning and Implementation."

Milford O. Rouse, MD, AMA President, will be the guest speaker at the Tuesday, June 18, luncheon honoring national Auxiliary past presidents and AMA Officers, Trustees and wives. At this time Mrs. Ritter will present the Auxiliary's contribution to the American Medical Association Education and Research Foundation. Last year's gift totaled $384,649.

The Tuesday afternoon meeting will feature a program by the Communications Committee relating to state publications. Following this program, films, including several on sex education, drug abuse, physical fitness and nutrition, will be shown for the remainder of the afternoon. This new feature will provide Auxiliary members with a catalog of available health education materials to be used in conjunction with existing Auxiliary programs.

The post-convention conference, usually scheduled for Thursday morning, will be held on Wednesday afternoon to give Auxiliary members free time on Thursday to visit areas of San Francisco. The Board of Directors will meet Thursday morning, instead of Wednesday afternoon.

The Auxiliary will also sponsor a program of daily activities for the pre-teens and teenagers of Auxiliary members and guests. Lunch in Chinatown and a cable car ride are among the events being considered.

Local arrangements for the convention are under the direction of Mrs. Lloyd Gillin and Mrs. Don C. Musser, both of San Francisco. Mrs. Ralph B. Eusden of Long Beach, Past President of the Auxiliary, is honorary chairman.

A more detailed listing of events is as follows:

Friday, June 14

Finance and Communications Committees meetings, 9:00 A.M. Joint meeting with Program Development Committee, 1:00 P.M.

Saturday, June 15

Meeting of the Board of Directors, 9:00 A.M.-5:00 P.M. National chairmen and National representatives to meetings (auxiliary and others) are invited to attend the afternoon meeting to give brief reports.

Board of Directors Luncheon, 1:00 P.M. Guests will be National Board, National Chairmen, Past Presidents and Honorary members.

Sunday, June 16

Meeting of the President-elect, Mrs. C. C. Long, with the 1968-69 Chairmen, 9:00 A.M. Bylaws Committee meeting, 8:00 A.M. Resolutions Committee meeting, 10:00 A.M. Registration will open at 11:00 A.M. Hospitality Room will open at 11:00 A.M. Coffee will be served until 1:00 P.M. Reception, honoring the National President and President-elect, will be held from five to seven o'clock at the St. Francis Hotel. "Dutch treat" bar with hors d'oeuvres courtesy of National Auxiliary. Members, husbands and guests cordially invited. Members are requested not to include family under twenty-one years of age.

Opening Meeting of the AMA House of Delegates. (Consult AMA program for time and place.)

AMA Medicine and Religion Program, 8:15 P.M., California Masonic Memorial Temple. Program enclosed.

Monday, June 17

Formal opening of the convention, 9:00 A.M. Business meeting 9:15 A.M. to 12:15 P.M. and 2:30 P.M. to 4:30 P.M.

Guest Day Luncheon for leaders of National Women's Volunteer Organizations, Auxiliary members and guests, 12:30 P.M., Mural-California Room. Guest speaker: Dr. Henrik L. Blum, Clinical Professor of Community Health Planning, University of California.

The afternoon program will schedule part of the state reports under the direction of the National Vice Presidents; remainder on Tuesday morning.

NOTE: Nominations for the 1969 nominating committee will be made during the business meeting Monday morning. The election will take place Tuesday afternoon in a polling place so designated. The hours for casting ballots will be from 2:30 P.M. to 6:00 P.M.

With this procedure it will be absolutely necessary and essential that state auxiliaries make certain all delegates are supplied with the proper credentials.

Ballots will be distributed ONLY to delegates with official credentials. Complete details will be sent to the state presidents at a later date. This is to alert them to the procedure and the importance of handling credential cards as required when they are received.

Tuesday, June 18

Presentation of state reports (continued from Monday).

Annual luncheon, honoring National Past Presidents. Guest speaker: Milford O. Rouse, MD, President, American Medical Association.

COMMUNICATIONS PROGRAM—2:00 P.M. to 2:30 P.M.

The Communications Committee will present a program with emphasis on "How to get the most out of your State Newsletter" and suggestions to state presidents, presidents-elect and state editors on the value of the newsletter in public relations activities.

From 2:30 P.M. to 4:30 P.M., there will be a presentation of health education films available through AMA Film Library and other sources for use by county and state auxiliaries.

Amendments, resolutions, reports and installation of the new officers will follow. Board of Directors luncheon and meeting 12:15 P.M., with 1968-69 Chairmen.

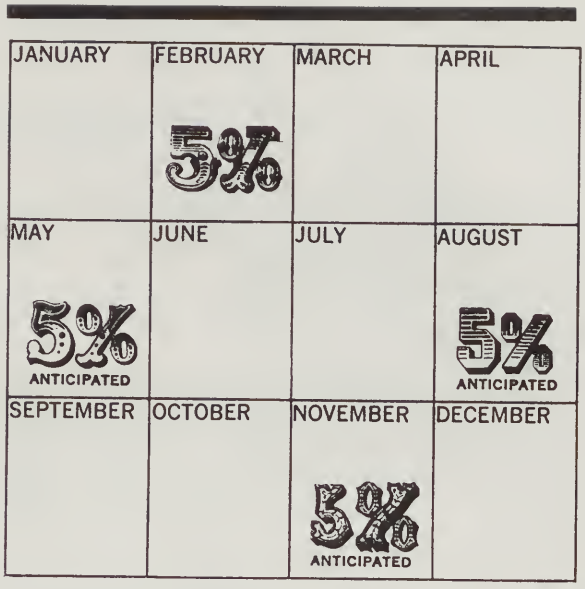
Postconvention Conference for Presidents and Presidents-elect (open to all Auxiliary members), 2:30 P.M.

Presentation and discussion of 1968-69 programs and projects.

AMA Round-Up—Ernest B. Howard, MD, Asst. Exec. Vice President, American Medical Association.

Thursday, June 20

Meeting of the Board of Directors, 9:00 A.M. Leadership Conference for Workshop Leaders, 1:00 P.M.



The state presidential delegate is the president in office at the time of the National convention, or the president-elect, or in the absence of both, an official representative appointed by the state auxiliary. No alternate is allowed.

Report, limited to three minutes, shall be read by the state president, or the immediate past president if she has prepared the report; unless permission of the convention is given another delegate from that constituency.

Chairman of delegates is appointed by the President in office at time of national convention and and can be any member of the delegate body.

TEEN-AGE PROGRAM: A program for Preteens and Teen-agers of Auxiliary members is being planned by the Teen-age Committee in San Francisco.

FEBRUARY, May, August and November—they're the months that Security Savings & Loan (a stock corporation) pays dividends . . . compounded daily . . . at the current rate of 5% per annum. digestive disorders

B and C vitamins aid therapy: Nausea, vomiting, and severe diarrhea may seriously interfere with the digestion and absorption of nutrients. STRESSCAPS capsules, containing therapeutic quantities of vitamins B and C, may help meet the needs of these patients. In digestive disorders, as in many stress conditions, STRESSCAPS vitamins aid therapy.

334–8-6471

Each capsule contains:

Vitamin B_1 (as Thiamine Mononitrate)	10 mg
Vitamin B_2 (Riboflavin)	10 mg
Vitamin B_6 (Pyridoxine HCl)	2 mg
Vitamin B_{12} Crystalline	4 mcgm
Vitamin C (Ascorbic Acid)	300 mg
Niacinamide	100 mg
Calcium Pantothenate	20 mg

Recommended intake: Adults, 1 capsule daily, for the treatment of vitamin deficiencies. Supplied in decorative "reminder" jars of 30 and 100.

STRESSCAPS®
Stress Formula B+C Vitamins Lederle

When the talk turns to oral contraceptives, it makes medical sense to remember low-dose Norinyl®-1.

(norethindrone 1mg. c̄ mestranol 0.05mg.)

Turn page for contraindications, precautions and side effects.

Reduction of oral contraceptive dosage to the lowest effective levels is a well-accepted principle of conservative medical practice. In keeping with this view, Norinyl is now also available as Norinyl-1, containing exactly one half the previous dosage of norethindrone and mestranol. Clinical experience has established that effective fertility control can be achieved with the same degree of reliability and safety with new Norinyl-1 when taken as directed.

What about switching patients from higher dosage forms?

In transferring patients to low-dose Norinyl-1 from higher-dosage oral contraceptives, some breakthrough bleeding may occur in the early cycles. In the majority of cases the bleeding episode is mild and self-limited. The long-term advantages of the lower dosage form should be weighed against the inconvenience of possible breakthrough bleeding in the individual patient.

Contraindications: 1. Patients with thrombophlebitis or with a history of thrombophlebitis or pulmonary embolism. 2. Liver dysfunction or disease. 3. Patients with known or suspected carcinoma of the breast or genital organs. 4. Undiagnosed vaginal bleeding.

Warnings: 1. Discontinue medication pending examination if there is sudden partial or complete loss of vision or if there is a sudden onset of proptosis, diplopia or migraine. If examination reveals papilledema or retinal vascular lesions, medication should be withdrawn. 2. Since the safety of NORINYL-1 (norethindrone 1 mg. with mestranol 0.05 mg.) in pregnancy has not been demonstrated, it is recommended that for any patient who has missed two consecutive periods, pregnancy should be ruled out before continuing the contraceptive regimen. If the patient has not adhered to the prescribed schedule, the possibility of pregnancy should be considered at the time of the first missed period. 3. Detectable amounts of the active ingredients in oral contraceptives have been identified in the milk of mothers receiving these drugs. The significance of this dose to the infant has not been determined.

Precautions: 1. The pretreatment physical examination should include special reference to breast and pelvic organs, as well as a Papanicolaou smear. 2. Endocrine and possibly liver function tests may be affected by treatment with NORINYL-1. Therefore, if such tests are abnormal in a patient taking NORINYL-1 it is recommended that they be repeated after the drug has been withdrawn for two months. 3. Under the influence of estrogen-progestogen preparations, preexisting uterine fibromyomata may increase in size. 4. Because these agents may cause some degree of fluid retention, conditions that may be influenced by this factor, such as epilepsy, migraine, asthma, cardiac or renal dysfunction, require careful observation. 5. NORINYL-1 should be used with caution in patients with a history of cerebrovascular accident. 6. In relation to breakthrough bleeding, and as in all cases of irregular bleeding *per vaginam*, nonfunctional causes should be borne in mind. In cases of undiagnosed vaginal bleeding, adequate diagnostic measures are indicated. 7. Patients with a history of psychic depression should be carefully observed and the drug discontinued if the depression recurs to a serious degree. 8. Any possible influence of prolonged NORINYL-1 therapy on pituitary, ovarian, adrenal, hepatic or uterine function awaits further study. 9. A decrease in glucose tolerance has been observed in a small percentage of patients on oral contraceptives. The mechanism of this decrease is obscure. For this reason, diabetic patients should be carefully observed while receiving NORINYL-1 therapy. 10. Because of the occasional occurrence of thrombophlebitis and pulmonary embolism in patients taking oral contraceptives, the physician should be alert to the earliest manifestations of the disease. 11. Because of the effects of estrogens on epiphyseal closure, NORINYL-1 should be used judiciously in young patients in whom bone growth is not complete. 12. The age of the patient constitutes no absolute limiting factor, although treatment with NORINYL-1 may mask the onset of the climacteric. 13. The pathologist should be advised of NORINYL-1 therapy when relevant specimens are submitted.

Side effects observed in patients receiving oral contraceptives: The following adverse reactions have been observed in patients receiving oral contraceptives: nausea, vomiting, gastrointestinal symptoms (such as abdominal cramps and bloating), breakthrough bleeding, spotting, change in menstrual flow, amenorrhea, edema, chloasma or melasma, breast changes (tenderness, enlargement and secretion), change in weight (increase or decrease), changes in cervical erosion and cervical secretion, suppression of lactation when given immediately postpartum, cholestatic jaundice, migraine, rash (allergic), rise in blood pressure in susceptible individuals, mental depression.

Although the following side effects have been reported in users of oral contraceptives, no cause and effect relationship has been established: anovulation post-treatment, premenstrual-like syndrome, changes in libido, changes in appetite, cystitis-like syndrome, headache, nervousness, dizziness, fatigue, backache, hirsutism, loss of scalp hair, erythema multiforme, erythema nodosum, hemorrhagic eruption, itching.

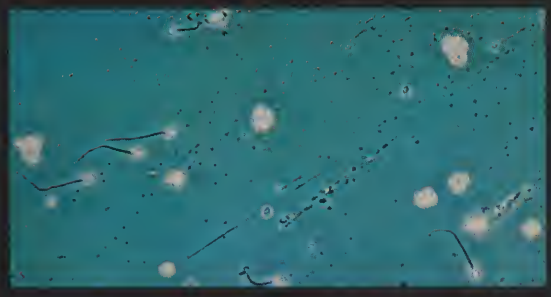
The following occurrences have been observed in users of oral contraceptives (a cause and effect relationship has been neither established nor disproved): thrombophlebitis, pulmonary embolism, neuro-ocular lesions.

The following laboratory results may be altered by the use of oral contraceptives: increased sulfobromophthalein and other hepatic function tests, coagulation tests (increase in prothrombin, Factors VII, VIII, IX and X), thyroid function (increase in PBI and butanol extractable protein-bound iodine and decrease in T^3 values), metyrapone test, pregnanediol determination.

norethindrone — an original steroid from

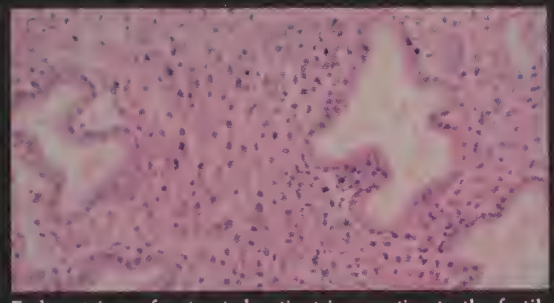
SYNTEX

LABORATORIES INC., PALO ALTO, CALIF.



Here's why Norinyl-1 makes medical sense.

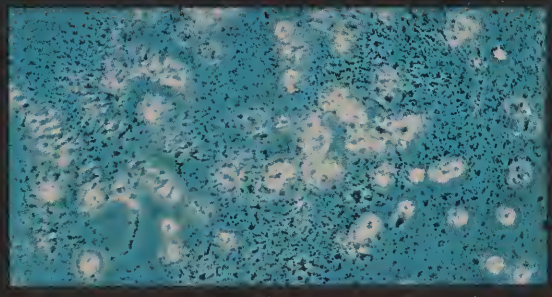
The effectiveness of Norinyl-1 as a low-dose oral contraceptive may be explained by its possible multiple action. In addition to its primary action of suppression of ovulation, Norinyl-1 may offer additional protective mechanisms... (1) creation of a cervical mucus that may be hostile to sperm penetration, and (2) development of an endometrium that may be out of phase with nidation. These effects are illustrated below.



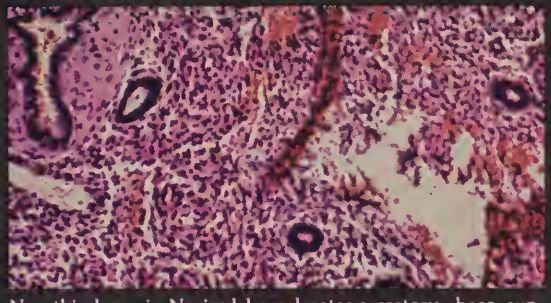
Untreated Patient

Cervical mucus at midcycle is usually thin and watery, with Spinnbarkeit (stretchability) of 15 to 20 cm.

Spermatozoa appear healthy, active, freemoving.



Endometrium of untreated patient is receptive to the fertilized ovum during secretory phase.



Norinyl-1 Patient

Cervical mucus at midcycle is scanty, viscous—with Spinnbarkeit of 1 cm. or less.

Immobile spermatozoa as they appear in cervical mucus taken from patient treated with Norinyl-1.

Norethindrone in Norinyl-1 accelerates secretory phase, suppresses glandular and vascular development.

Norinyl®-1 tablets
(norethindrone 1mg ē mestranol 0 05mg.)

- new low dose of time-proved ingredients
- established norethindrone/mestranol ratio
- lower patient cost

Indications: Hypertension and many types of edema involving retention of salt and water.
Contraindications: Hypersensitivity and most cases of severe renal or hepatic disease.
Warning: With the administration of enteric-coated potassium supplements, which should be used only when adequate dietary supplementation is not practical, the possibility of small bowel lesions (obstruction, hemorrhage, and perforation) should be kept in mind. Surgery for these lesions has frequently been required and deaths have occurred. Discontinue enteric-coated potassium supplements immediately if abdominal pain, distention, nausea, vomiting, or gastrointestinal bleeding occur.
Use with caution in pregnant patients, since the drug may cross the placental barrier and adverse reactions which may occur in the adult (thrombocytopenia, hyperbilirubinemia, altered carbohydrate metabolism, etc.) are potential problems in the newborn.
Precautions: Antihypertensive therapy with Hygroton should always be initiated cautiously in postsympathectomy patients and in patients receiving ganglionic blocking agents or other potent antihypertensive drugs, or curare. Reduce dosage of concomitant antihypertensive agents by at least one-half. Barbiturates, narcotics or alcohol may potentiate hypotension. Because of the possibility of progression of renal damage, periodic determination of the BUN is indicated. Discontinue if the BUN rises or liver dysfunction is aggravated. Hepatic coma may be precipitated. Electrolyte imbalance, sodium and/or potassium depletion may occur. If potassium depletion should occur during therapy, Hygroton should be discontinued and potassium supplements given, provided the

Did Dorothy Larson show you her ankles in private?

Now she shows them in public.

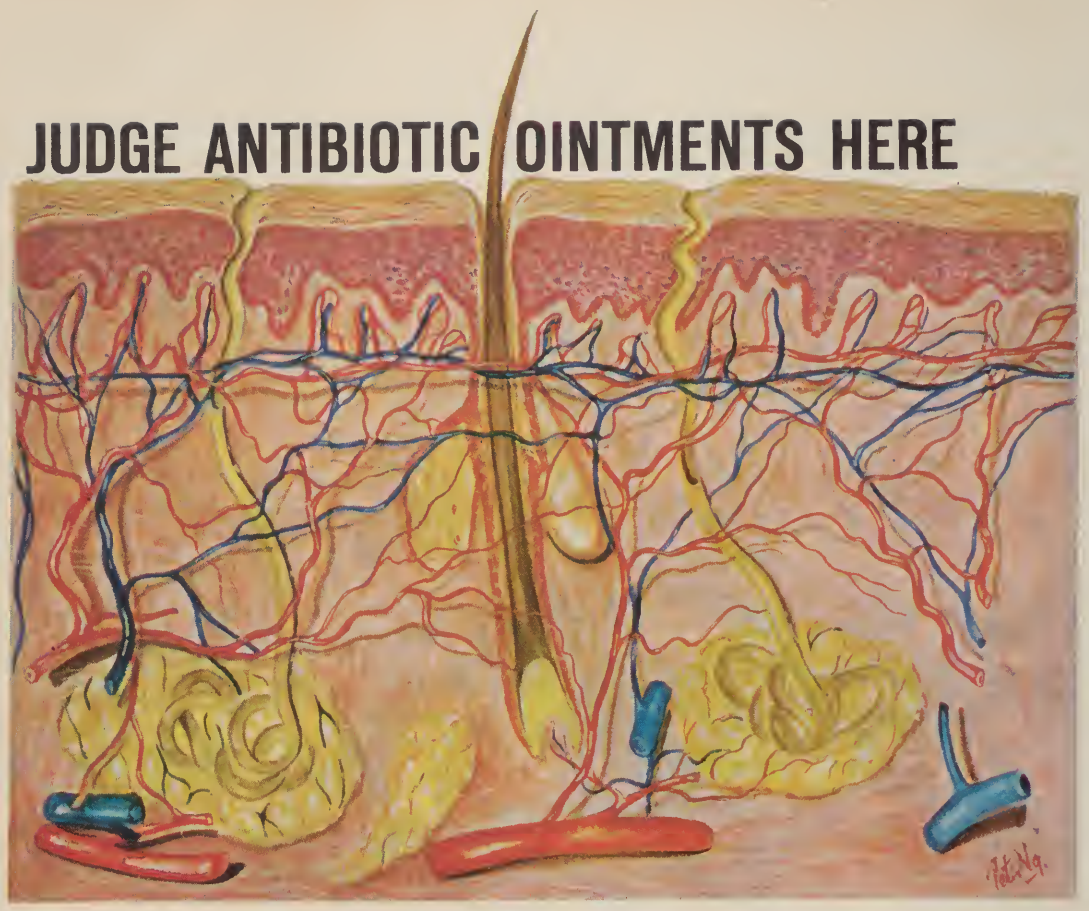
Hygroton® Geigy
chlorthalidone

Your office examination confirmed Mrs. Larson's ankle edema.

You prescribed Hygroton to get rid of the edema.

And you found that Hygroton is not only usually effective; it frequently costs less than other equivalent therapy.

A nice way to treat the Mrs. Larsons in your practice.



Hygroton therapy may mean troublesome side effects for some patients. And you can't prescribe it for patients with hypersensitivity to the drug or severe renal or hepatic diseases. Before writing it for your patients, please check the prescribing information. It's summarized below.

JUDGE ANTIBIOTIC OINTMENTS HERE

Results on skin are final proof of any topical antibiotic's effectiveness

No in vitro test can duplicate a clinical situation on living skin. 'Neosporin' (polymyxin B—bacitracin—neomycin) Ointment has consistently proven its effectiveness in thousands of cases of bacterial skin infection. The spectra of the three antibiotics overlap in such a way as to provide bactericidal action against most pathogenic bacteria likely to be found topically. Diffusion of the antibiotics from the special petrolatum base is rapid since they are insoluble in the petrolatum, but readily soluble in tissue fluids. The Ointment is bland and nonirritating.

Caution: As with other antibiotic preparations, prolonged use may result in overgrowth of nonsusceptible organisms and/or fungi. Appropriate measures should be taken if this occurs. Articles in the current medical literature indicate an increase in the prevalence of persons allergic to neomycin. The possibility of such a reaction should be borne in mind.

Contraindications: This product is contraindicated in those individuals who have shown hypersensitivity to any of its components.

Supplied: Tubes of 1 oz., ½ oz. with applicator tip, and ⅛ oz. with ophthalmic tip.

Complete literature available on request from Professional Services Dept. PML.

New Pamphlet on "the Pill"

Many of the questions patients ask about "the pill" and other birth control techniques are answered in a AMA pamphlet, "Contraceptive Drugs & Devices."

Containing the latest available facts on contraceptive drugs and devices, the publication replaces the former AMA pamphlet, "Is the Pill the Answer?"

The six-page pamphlet discusses the various types of oral contraceptives and intrauterine contraceptive devices, their effectiveness and the incidental effects which may occur with their use. It urges readers to obtain their physician's advice in selecting a contraceptive method that suits their individual needs and desires.

Review copies may be obtained from the AMA's Health Education Department. Quantity orders may be obtained from the Order Department at prices ranging from 14¢ each for 50-99 copies to 8¢ each for 1,000 or more.

Minor Burns	Cold Sores
Athlete's Foot	Heat Rash
Dry Skin	Diaper Rash
Wind Burn	Chapping
Insect Stings	Hemorrhoids

For Safe, Sure, Speedy Relief —
— Get RESINOL GREASELESS!

Medical Scientists have conquered 6 dread diseases in the past decade, but they are largely in the dark, they admit, in finding relief for one age-old ailment—itching

New remedies containing antibiotics have been tested, but have often caused side effects which are worse than itching skin. After many years of research and testing, **Resinol Greaseless Cream** was developed. . . . A doctor's formula containing safe yet powerful ingredients, **Resinol Greaseless** contains an amazing, proven "anti-itch" medication called Resorcin, which quickly and effectively relieves most any kind of itching. Try **Resinol Greaseless** . . . You'll be delighted to find that it really works! At all drug stores. Buy a tube today.

Doctor Ackerman Predicts 'Usual and Customary' Increase

Carl R. Ackerman, MD, chairman of the board, National Association of Blue Shield Plans, foresees an acceleration of the trend toward usual and customary fee programs by Blue Shield Plans "over the next two to three years."

Interviewed in the January 8, 1968 issue of *Medical Economics,* Dr. Ackerman observed:

"The move to usual and customary is approaching a crescendo, and by 1970 all the Plans will probably offer such coverage. Just look at its development recently: Out of a total of 73 U. S. Plans, the number offering some form of usual and customary coverage has exploded from a handful in 1965 to 48 today."

When asked to explain Blue Shield's move toward this type of fee program in contrast to the commercial carriers which have incorporated usual-and-customary-type payments in their major medical programs for 20 years, Dr. Ackerman replied:

"Twenty years ago I would have considered paid-in-full benefits for all subscribers an abdication of the responsibility of Blue Shield and the medical profession to assure low-income subscribers of adequate protection against high health costs."

With the enactment of Medicare and Medicaid, however, government "has assumed the responsibility once borne by the medical profession through Blue Shield," he said.

"Today the public and the medical profession both want a 'fair fee' to coincide with a 'paid-in full fee.' That's why the usual and customary approach is so satisfying to the two parties in which Blue Shield is most interested—the patient and the doctor," Dr. Ackerman explained.

In response to a question concerning possible fee curbs inherent in the fee profiles developed by Blue Shield Plans, Dr. Ackerman pointed out that he knew of no usual and customary formula "that doesn't have a built-in mechanism to adjust fees to keep in step with inflation or to reflect the individual physician's increasing prominence and ability."

Neither does it mean, however, "that 'the sky's the limit' will be acceptable," he added.

We recommend **CAMP**

SACRO-ILIAC SUPPORTS

Scientific block and tackle lacings cause the durable Camp material to firmly encircle the bony pelvis, in conservative treatment of sacro-iliac conditions. This basic Camp model also provides upper adjustment to balance the support or to ease spasm and pain, depending on the needs of the wearer. Effective for relief of effects of disease and moderate low back injury.

Personal Communication with Teen-agers May Help Solve the Problem of Drug Abuse

"More teen-agers would resist the temptation to join a 'pot party' if they were given the facts about the potential dangers of drug abuse," states David Blake, PhD, assistant professor of pharmacology at the University of Maryland School of Pharmacy.

Dr. Blake has involved himself in a project to visit area high schools and talk to students directly in order to explain these dangers. Thirteen students from the pharmacy school volunteered to accompany him. After Dr. Blake presents a lecture and films to the students, the volunteers meet with small groups of students for informal discussion.

"We feel that students are given piecemeal information by the press, movies, and friends. What they really want and need is objective information," Dr. Blake emphasized. "And since high school students naturally respond best to authorities near their own age, I'm very pleased that so many pharmacy students are interested in talking with them.

"Because of his education and professional responsibility in community health, the pharmacist is in a unique position to inform the public about drugs," Dr. Blake says. "And teen-agers are the group most susceptible to drug addiction—they are the ones we should concentrate on reaching."

An indication that Dr. Blake is reaching the teen-ager is this comment from a Dulaney student, following the presentation there:

"This is the first time we have been presented with this depth of information. Sure, you can read about it [drugs] in books, but we are not talked to frankly about it. . . . More presentations like this one are needed in more high schools all over."

How come the world's richest companies buy the lowest priced dictating machine?

Eastern Airlines, Union Carbide or Gulf could easily afford any of the six nationally advertised dictating machines priced from $249.50 to $800. Yet they, as well as Ford, American Airlines, Allied Chemical, United States Lines, Goodyear Tire & Rubber, Home Life and many other giants of business, are buying the new Voca at $199.95. Could it be that the Voca is just as good, regardless of price? Or perhaps even better? Find out. We'll be glad to give you the full story. Phone, or mail the coupon today.

Alfred S. Bright, C.L.U.
Agency Manager,
HOME LIFE INSURANCE CO., N.Y.

"In our offices, we need dictating equipment we can depend on . . . that's why we selected VOCA."

Voca Patent Nos. 3,243,133; 199,189, other patents pending.

Only $199.95 complete with dictating or transcribing accessories.

Why? I want to know why experts choose the Voca dictating/transcribing machine over more expensive makes. Please send me full details and full color brochure.

The MISSING LINK in Weight Control

Diet Control — **Appetite Control**

and now finally
... the neglected factor

Ex-Caloric Wafers*

Not marketed in combination with any anorexiant drug, since that would limit the dosage flexibility of both.

A SUBSTITUTE FOR FOOD

A DEVICE TO SATISFY THE HUNGER FOR BULK IN PATIENTS ON A REDUCING DIET.

Designed for bulk hunger . . . not laxation!
EX-CALORIC WAFERS CONTAIN NO LAXATIVE HEMICELLULOSE

DESCRIPTION:
Artificially sweetened and flavored. Each wafer contains 453 mg. of these non-nutritive, synthetic hydrophilic colloid bulking agents: carboxymethylcellulose 181 mg. and methylcellulose (400 centipoise type) 272 mg. Safe for use by diabetic patients placed on a restricted reducing diet. Usual daily intake less than 3 calories per day.

ACTION:
Ex-Caloric Wafers produce such bulk in a part of the alimentary tract as to ordinarily impart a highly satisfactory sense of fullness for those obese patients who complain of an empty feeling ("hollow hunger") when placed on a reducing diet and deprived of their between-meal snacks.

ADMINISTRATION:
3 or 4 wafers t.i.d., a.c. or p.c. or mid-morning, mid-afternoon and mid-evening. At least 1 large glass of water must be taken with each dose.

CONTRAINDICATIONS:
Ex-Caloric Wafers are completely innocuous and may be administered with impunity in any necessary quantities to all obese patients, including children and the aged. The only contraindications are acute ulcerative colitis and organic intestinal obstruction.

Samples To Physicians On Request

T. M.

Printed 6-66

the "Librium® effect"
(chlordiazepoxide HCl)

For years, physicians have valued Librium (chlordiazepoxide HCl) capsules for their reliable calming effect.

(in capsules)

Now, the same dependable antianxiety effect can be obtained with convenient tablets—Libritabs (chlordiazepoxide).

(in Libritabs™)
(chlordiazepoxide)

Before prescribing, please consult complete product information, a summary of which follows:

Contraindications: Patients with known hypersensitivity to the drug.

Warnings: Caution patients about possible combined effects with alcohol and other CNS depressants. As with all CNS-acting drugs, caution patients against hazardous occupations requiring complete mental alertness (*e.g.*, operating machinery, driving). Though physical and psychological dependence have rarely been reported on recommended doses, use caution in administering to addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions), following discontinuation of the drug and similar to those seen with barbiturates, have been reported. Use of any drug in pregnancy, lactation, or in women of childbearing age requires that its potential benefits be weighed against its possible hazards.

Precautions: In the elderly and debilitated, and in children over six, limit to smallest effective dosage (initially 10 mg or less per day) to preclude ataxia or oversedation, increasing gradually as needed and tolerated. Not recommended in children under six. Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects, particularly in use of potentiating drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions (*e.g.*, excitement, stimulation and acute rage) have been reported in psychiatric patients and hyperactive aggressive children. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship has not been established clinically.

Adverse Reactions: Drowsiness, ataxia and confusion may occur, especially in the elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally observed at the lower dosage ranges. In a few instances syncope has been reported. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent and generally controlled with dosage reduction; changes in EEG patterns (low-voltage fast activity) may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice and hepatic dysfunction have been reported occasionally, making periodic blood counts and liver-function tests advisable during protracted therapy.

Usual Daily Dosage: Individualize for maximum beneficial effects. *Oral*—Adults: Mild and moderate anxiety and tension, 5 or 10 mg t.i.d. or q.i.d.; severe states, 20 or 25 mg t.i.d. or q.i.d. Geriatric patients: 5 mg b.i.d. to q.i.d. (See Precautions.)

Supplied: Librium® (chlordiazepoxide HCl) Capsules, 5 mg, 10 mg and 25 mg—bottles of 50. Libritabs™ (chlordiazepoxide) Tablets, 5 mg, 10 mg and 25 mg—bottles of 100. With respect to clinical activity, capsules and tablets are indistinguishable.

Dilantin®
(diphenylhydantoin)

PARKE-DAVIS

In untold thousands of epileptic patients... Dilantin has been, and continues to be, the bedrock of therapy.

DILANTIN is useful in the treatment of grand mal epilepsy and certain other convulsive states. Its use will prevent or greatly reduce the incidence and severity of convulsive seizures in a substantial percentage of epileptic patients, without the hypnotic and narcotizing effects of many anticonvulsant drugs.

PRECAUTIONS: Periodic examination of the blood is advisable. Nystagmus in combination with diplopia and ataxia indicates dosage should be reduced. The possibility of toxic effects during pregnancy has not been explored. ADVERSE REACTIONS: Allergic phenomena such as polyarthropathy, fever, skin eruptions, and acute generalized morbilliform eruptions with or without fever. Rarely, dermatitis goes on to exfoliation with hepatitis, and further dosage is contraindicated. Gingival hypertrophy, hirsutism, and excessive motor activity are occasionally encountered. During initial treatment, side effects may include gastric distress, nausea, weight loss, nervousness, sleeplessness, feeling of unsteadiness. Macrocytosis, megaloblastic anemia, leukopenia, granulocytopenia, thrombocytopenia, pancytopenia, agranulocytosis, and aplastic anemia have been reported. Nystagmus, lymphadenopathy, lupus erythematosus, erythema multiforme (Stevens-Johnson syndrome), and a syndrome resembling infectious mononucleosis with jaundice have occurred. DILANTIN is supplied in several forms including Kapseals® containing 0.1 Gm. and 0.03 Gm. diphenylhydantoin sodium.

Parke, Davis & Company, Detroit, Michigan 48232

The color combinations of the banded capsules are Parke-Davis trademarks. The orange-banded white capsule identifies Parke-Davis 0.1 Gm. diphenylhydantoin sodium; the pink-banded white capsule 0.03 Gm. diphenylhydantoin sodium.

PARKE-DAVIS 015R67

■ to help restore and stabilize the intestinal flora

■ for fever blisters and canker sores of herpetic origin

LACTINEX contains both *Lactobacillus acidophilus* and *L. bulgaricus* in a standardized viable culture, with the naturally occurring metabolic products produced by these organisms.

First introduced to help restore the flora of the intestinal tract in infants and adults,[1, 2, 3, 4] LACTINEX has also been shown to be useful in the treatment of fever blisters and canker sores of herpetic origin.[5, 6, 7, 8]

No untoward side effects have been reported to date.

Literature on indications and dosage available on request.

ON THE COVER: Davidge Hall of the University of Maryland School of Medicine is the oldest structure in this country from which the degree of Doctor of Medicine has been granted annually since its erection in 1812. Named after the first Dean of the medical school, Dr. John Beale Davidge, Davidge Hall is modeled after the Pantheon in Rome. Located at 522 West Lombard Street, the building houses the offices of the Dean, his staff, the Committee on Admissions, the Postgraduate Committee, and the Medical Alumni Office, in addition to Chemical and Anatomical Halls.

b.i.d.

If your objective in the use of a broad-spectrum antibiotic is prolonged action, with high blood levels, consider DECLOMYCIN 300 mg b.i.d.

The maintenance dosage of DECLOMYCIN 300 mg can be kept at this convenient schedule because of its unusually high effective blood and tissue levels.

In clinical practice, blood levels produced by a therapeutic dose of DECLOMYCIN are high, prolonged, and effective, because of high serum binding and slow renal clearance.

DECLOMYCIN®
DEMETHYLCHLORTETRACYCLINE

Lederle

Prescribing information on next page.

DECLOMYCIN®
DEMETHYLCHLORTETRACYCLINE
b.i.d.

DECLOMYCIN Demethylchlortetracycline should be equally or more effective therapeutically than other tetracyclines when the offending organisms are tetracycline-sensitive.

Contraindication: History of hypersensitivity to demethylchlortetracycline.

Warning—In renal impairment, usual doses may lead to excessive accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated, and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort. Necessary subsequent courses of treatment with tetracyclines should be carefully observed.

Precautions—Overgrowth of nonsusceptible organisms may occur. Constant observation is essential. If new infections appear, appropriate measures should be taken. In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment.

Side Effects—Gastrointestinal system—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. Skin—maculopapular and erythematous rashes; a rare case of exfoliative dermatitis has been reported. Photosensitivity; onycholysis and discoloration of the nails (rare). Kidney—rise in BUN, apparently dose related. Transient increase in urinary output, sometimes accompanied by thirst (rare). Hypersensitivity reactions—urticaria, angioneurotic edema, anaphylaxis. Teeth—dental staining (yellow-brown) in children of mothers given this drug during the latter half of pregnancy, and in children given the drug during the neonatal period, infancy and early childhood. Enamel hypoplasia has been seen in a few children. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy.

Average Adult Daily Dosage: 150 mg q.i.d. or 300 mg b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products. Treatment of streptococcal infections should continue for 10 days, even though symptoms have subsided.

In the treatment of syphilis a dosage schedule of a total of 12 to 18 Gm given in equally divided doses over a period of 10 to 15 days should be followed. Close follow-up observation of the patient is recommended, including appropriate laboratory tests, since demethylchlortetracycline has not had adequate evaluation in all stages of syphilis. Spinal fluid examination should be included as part of this follow-up.

Acute gonococcal anterior urethritis in males has been treated effectively with a single dose of 600-900 mg of DECLOMYCIN Demethylchlortetracycline. Individuals unable to tolerate large single doses due to gastrointestinal side effects may be treated with 150 mg every 6 hours for a minimum of 4 doses or 300 mg every 12 hours for a minimum of 2 doses. Females should be treated with a dosage of 150 mg every 6 hours or 300 mg every 12 hours until a cure is effected.

Primary Atypical Pneumonia (Eaton Agent): The average adult daily dosage is 900 mg in 3 divided doses for six days.

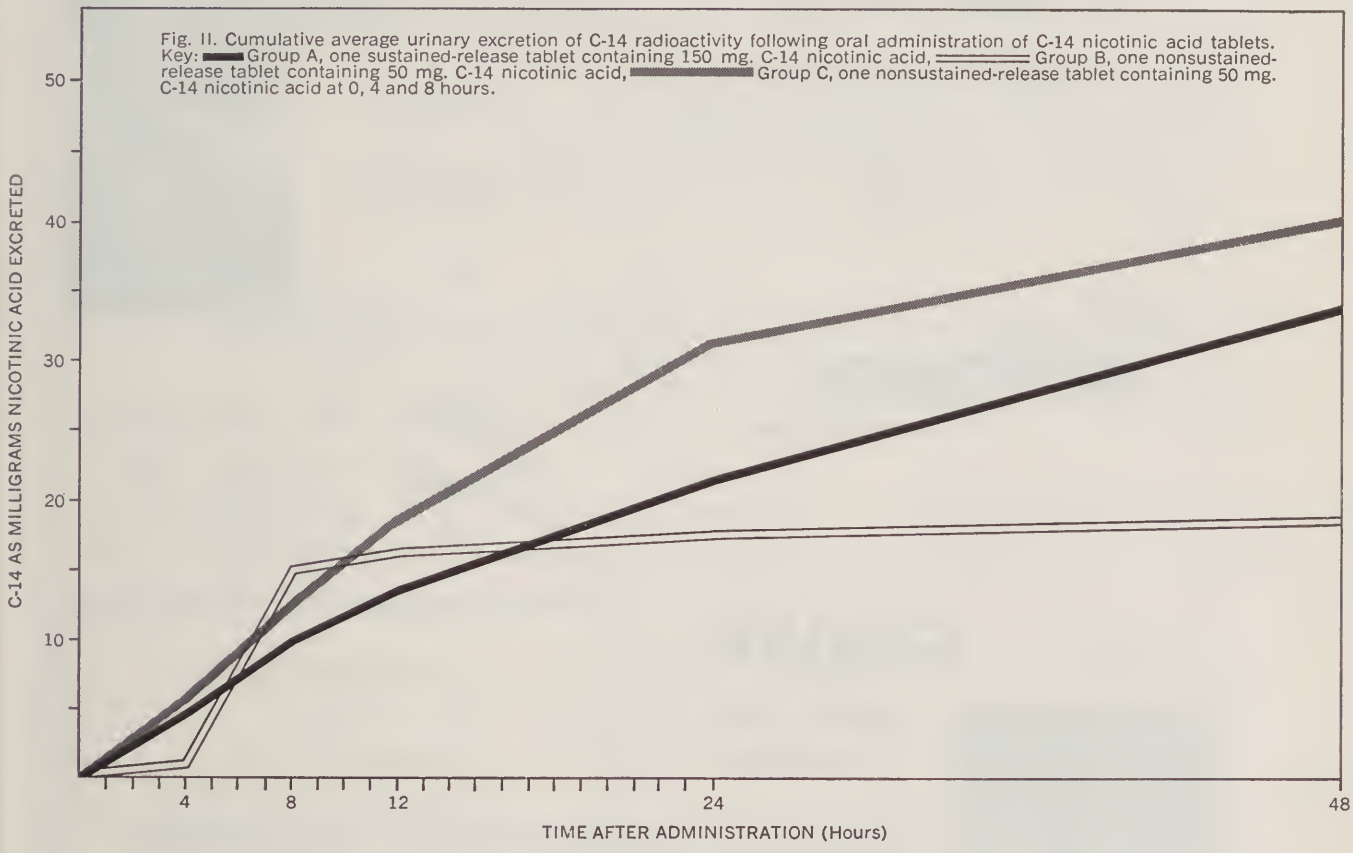
Sustained circulatory, respiratory and cerebral stimulation for the

(fewer absent doses by absent-minded patients)



Human volunteer subjects were administered Geroniazol TT tablets with the nicotinic acid component made radioactive with C-14. Plasma and urine samples were analyzed. (See Figures I and II) The radioactive tracer study substantiated the previous clinical evidence that the release of nicotinic acid from the Geroniazol TT tablet produced a gradual rise in plasma levels to a plateau for a total of 12 hours and more.

Such proven sustained activity makes the management of geriatric patients much easier by minimizing the possibility of neglected doses through absent-mindedness or senile confusion. Therapy *can* be continuous on a daily dose of only one Geroniazol TT tablet every 12 hours.

The gradual release of nicotinic acid in Geroniazol TT will provide the well-known peripheral vasodilatation needed in patients with deficient circulation and with a minimum amount (if any) of "flushing." Also, cerebrovascular circulation is complemented by pentylenetetrazol, long-established as a cerebral and respiratory stimulant.

Geroniazol TT improves the typical, unfortunate, signs of senile confusion. Patients become more alert,

aged and debilitated

less confused and moody. Personal care, memory, emotional stability, social attention improve. Fatigue, apathy and irritability are reduced.

A prescription for 100 tablets of Geroniazol TT will permit your patients to enjoy the benefits of time-prolonged nicotinic acid/pentylenetetrazol therapy, at an economical price. Dosage is only one tablet every 12 hours.

Contraindications: There are no known contraindications.

Precautions: Exercise caution when treating patients with a low convulsive threshold.

Side Effects: Side effects are rarely encountered, however due to the vasodilatation effect of nicotinic acid, transitory mild nausea, flushing, tingling and pruritus are possible.

Dosage: One tablet every 12 hours.

Supplied: Prescribe bottles of 100 tablets, to take advantage of recent price reduction.

REFERENCE COMMITTEE HEARING

The date chosen for the meeting of the Reference Committee to consider resolutions up for discussion at the Faculty's Semiannual Meeting is:

THURSDAY, AUGUST 15, 1968 at 8:00 p.m.

As of this date, the only resolution up for consideration is Resolution 6A/68, referred to the Committee by the House of Delegates on Friday, April 19, 1968.

VOTED OUTSTANDING CHAPTER

The Maryland Chapter, American Academy of Pediatrics, has received a $2,500 award as the outstanding chapter of the year. The check will be presented to Wilson Grubb, M.D. at the annual meeting of the American Academy in Chicago.

LEGISLATIVE ACTIVITY

In the early part of May, the Governor signed into law House Bill 21, establishing the Commission on Medical Discipline.

At the same time, he vetoed House Bill 574, that would have established that physicians shall prescribe by generic name the drugs used in Federal grant programs.

NEWS NOTES

Frederick M. Zerzavy, M.D., of Baltimore, is currently serving in the AMA Volunteer Physicians for Viet Nam program.

Samuel P. Asper, M.D., Baltimore, has been named President-elect of the American College of Physicians.

Isadore Kaplan, M.D., Baltimore, has been elected president of the American Association of Railway Surgeons.

E. H. Silverstein, M.D., Baltimore, has been certified as a Diplomate of the American Board of Dermatology.

E. F. Shaw Wilgis, M.D., is now practicing General and Hand Surgery at 5820 York Road, Baltimore.

SPECIALTY MEETINGS

Specialty society meetings at the Semiannual session include: Surgeons, Psychiatrists, Diabetes, Rheumatic Diseases and Ophthalmologists.

ITEMIZED BILLS UNDER MEDICARE

At the AMA Houston meeting, physicians were urged in a resolution adopted there, that they itemize bills for professional services rendered to their Medicare patients.

The local carrier, Maryland Medical Service, Inc. is faced with increasing problems in processing such bills because of lack of information which, in many cases, the patient cannot provide.

The cooperation of all physicians is urged.

MEDICAL CARE UTILIZATION SURVEY

A Medical Care Utilization Survey is currently in progress in the Metropolitan Baltimore area of the State. The survey is intended to find out from patients how they received medical care and for what reasons.

In addition to this survey, some physicians will be asked questions dealing with their practices.

Members are provided this information in the event they are approached in this connection.

EDUCATIONAL MAIL-IN

The offer of pamphlets for physicians' patients is still drawing daily receipt of mail-in cards at the Faculty offices. Geared to save the busy physician's time, the method provides an easy mechanism for patients to receive authoritative material on subjects of concern to them.

Physicians who wish postal cards for distribution to their patients may request them through the Faculty office. Full details will be sent.

Book Reviews

HEREDITY, DISEASE, AND MAN: Genetics in Medicine by Alan E. H. Emery, MD, University of California Press, Berkeley, Calif. 1968.

This new series of books is intended for serious readers who wish to learn more about current medicine but who cannot and should not be expected to read textbooks or scientific journals intended for physicians and medical students. This and succeeding volumes will be useful to students in the biological sciences and to those whose work brings them into contact with medical issues. Each book will be a concise, comprehensive and illustrated essay on a major disease or body system and its fundamentally related parts, or a specialized area of research or an aspect of society that affects the public health.

SURGERY OF THE AGED AND DEBILITATED PATIENT by John H. Powers, MD, W. B. Saunders and Company, Philadelphia, Pa. 1968.

This volume has been prepared with emphasis on the particular problems and complications associated with surgery of the aged. The text has been prepared by many authorities.

The knowledge and information contained in this book should do much to alleviate the many physical and mental burdens of the aged; and render prophylactic, elective and urgent surgery safer and more acceptable during the declining years of man.

CANCER EPIDEMIOLOGY: Methods of Study by Abraham M. Lilienfeld, MD, and Einar Pedersen and John E. Dowd. The Johns Hopkins Press, Baltimore, Md. 1967.

The purpose of this book is to fill a gap in the field of medicine that involves Epidemiology and the use of material already in the hands of physicians and others who may lack the knowledge to utilize their own material or make it available in a form that will permit its use by others.

This book is devoted to presenting the proper methods being used in cancer to those who, because of their interest in cancer problems, may wish to apply them.

HANDBOOK OF FRACTURES by Edgar Lee Ralston, MD, The C. V. Mosby Company, St. Louis, Mo. 1967.

What the profession needs in the way of an additional text on Fractures is a rather moot point. But the author makes it clear that this is a subject that medical students can never receive enough knowledge in; and one area in which a void exists.

The book is intended as an aid in the early steps of student training in this subject. It fulfills this function well.

INFECTIOUS DISEASES OF CHILDREN by Saul Krugman, MD, and Robert Ward, MD, The C. V. Mosby Company, St. Louis, Mo. 1968.

This fourth edition is not designed to be an all-inclusive text on infectious diseases, but comes remarkably near to it. Latest data on the use of virus vaccines, including mumps virus vaccine, as well as rubella virus vaccine; viral hepatitis, sepsis in the newborn and all of the most up-to-date data is part and parcel of this outstanding work.

Don't let monilia cut broad-spectrum therapy short...

start with Tetrex-F®
tetracycline phosphate complex-nystatin

Use of broad-spectrum antibiotics can cause fungal overgrowth in the alimentary tract... and give rise to symptoms so troublesome that therapy must be prematurely stopped. Tetrex-F (tetracycline phosphate complex-nystatin) helps you circumvent this problem.

The nystatin can prevent overgrowth of monilia; the phosphate complex delivers tetracycline to the blood rapidly. Side effects are infrequent.

High-Risk Patients

Tetrex-F (tetracycline phosphate complex-nystatin) is especially useful in patients most susceptible to fungal overgrowth during tetracycline therapy: (1) the elderly or debilitated, (2) young children, (3) the diabetic, (4) those on long-term tetracycline therapy, (5) those on steroid therapy, (6) those who have had moniliasis before, and (7) pregnant patients with a history of monilial vaginitis.

When you start with economical Tetrex-F (tetracycline phosphate complex-nystatin), you can complete the full course of broad-spectrum therapy with less chance of losing control elsewhere. A good start for a healthy finish.

PRESCRIBING INFORMATION. For complete information consult Official Package Circular. *Indications:* Infections of respiratory, gastrointestinal and genitourinary tracts and skin and soft tissues due to tetracycline-sensitive organisms, in patients with increased susceptibility to monilial infections. *Contraindications:* The drug is contraindicated in patients hypersensitive to its components. *Warnings:* Photodynamic reactions have been produced by tetracyclines. Natural and artificial sunlight should be avoided during therapy. Stop treatment if skin discomfort occurs. With renal impairment, systemic accumulation and hepatotoxicity may occur. In this situation, lower doses should be used. Tooth staining and enamel hypoplasia may be induced during tooth development (last trimester of pregnancy, neonatal period and childhood). *Precautions:* Bacterial superinfections may occur. Infants may develop increased intracranial pressure with bulging fontanels. In gonorrheal therapy, serologic tests for syphilis should be conducted initially and monthly for 3 months. *Adverse Reactions:* Glossitis, stomatitis, nausea, diarrhea, flatulence, proctitis, vaginitis, dermatitis, and allergic reactions may occur. *Usual Adult Dosage:* 1 capsule q.i.d. Continue for 10 days in Beta-hemolytic streptococcal infections. Administer one hour before or two hours after meals. *Supplied:* Capsules, bottles of 16 and 100. Each capsule contains tetracycline phosphate complex equivalent to 250 mg. tetracycline HCl activity and 250,000 units of nystatin. For Oral Suspension, 125 mg. tetracycline and 125,000 u. nystatin/5 ml., 60 ml. bottles.

JUDGE ANTIBIOTIC OINTMENTS HERE

Results on skin are final proof of any topical antibiotic's effectiveness

No in vitro test can duplicate a clinical situation on living skin. 'Neosporin' (polymyxin B—bacitracin—neomycin) Ointment has consistently proven its effectiveness in thousands of cases of bacterial skin infection. The spectra of the three antibiotics overlap in such a way as to provide bactericidal action against most pathogenic bacteria likely to be found topically. Diffusion of the antibiotics from the special petrolatum base is rapid since they are insoluble in the petrolatum, but readily soluble in tissue fluids. The Ointment is bland and nonirritating.

Caution: As with other antibiotic preparations, prolonged use may result in overgrowth of nonsusceptible organisms and/or fungi. Appropriate measures should be taken if this occurs. Articles in the current medical literature indicate an increase in the prevalence of persons allergic to neomycin. The possibility of such a reaction should be borne in mind.

Contraindications: This product is contraindicated in those individuals who have shown hypersensitivity to any of its components.

Supplied: Tubes of 1 oz., ½ oz. with applicator tip, and ⅛ oz. with ophthalmic tip.

Complete literature available on request from Professional Services Dept. PML.

'NEOSPORIN'®

POLYMYXIN B-BACITRACIN-NEOMYCIN OINTMENT

BURROUGHS WELLCOME & CO. (U.S.A.) INC., Tuckahoe, N.Y.

New Therapeutic breakthrough in non-narcotic control of the pain of

Tegretol® carbamazepine trigeminal neuralgia

Warning
Fatal cases of aplastic anemia have been reported following treatment with Tegretol. Agranulocytosis, thrombocytopenia and transitory leukopenia have also been observed.
Complete blood and platelet counts should be done prior to and at regular intervals during treatment with the drug (see recommendations under "Important Note and Precautions") to help in the early detection of serious bone marrow injury. Abnormalities in initial blood tests should rule out use of the drug. Also, patients should be made aware of such early toxic signs of a potential hematologic problem as fever, sore throat, mouth ulcers, easy bruising and petechial or purpuric hemorrhage. Should such signs appear, the patient should be advised to discontinue the drug and to report to the physician immediately.

Indication Tegretol is indicated in the treatment of the pain associated with true trigeminal neuralgia. It is not a simple analgesic and should never be administered for relief of trivial facial aches or pains.
Contraindication Do not use in those with a known sensitivity to any tricyclic compound or in those being treated with M.A.O.I. agents. As long a period as possible should elapse before using Tegretol in patients who have been treated with M.A.O.I.'s, with a minimum of 7 days. In such cases, initial dosage should be low and the patient's reaction to gradual increments closely observed.
Important Note and Precautions Familiarity with the clinical symptoms which lead to an accurate diagnosis of true trigeminal neuralgia and with the complete prescribing information, careful patient selection, a thorough examination before treatment and close patient supervision throughout the treatment period are essential to the safe and effective use of this drug.
Where feasible, Tegretol should not be used in conjunction with any potent drug which may increase the possibility of toxic reactions.
In pregnancy, the drug should not be prescribed during the first trimester and thereafter only to patients in whom the clinical situation warrants the potential risk. It should not be administered to nursing mothers.
Patients with increased intraocular pressure should be closely observed during treatment with this drug because of its anticholinergic effect.
Because of the drug's relationship to other tricyclic compounds, the possibility of activation of latent psychosis and, in the elderly, of confusion or agitation, should be considered.
Dizziness and drowsiness may occur and patients should be cautioned about the hazards of operating machinery or automobiles and of engaging in other hazardous tasks.
Use cautiously in patients with a history of coronary artery disease, organic heart disease, congestive failure or liver disease.
Before initiating therapy, the following laboratory procedures should be performed:
1. Complete blood and platelet counts which, if abnormal, should rule out the use of the drug.
2. Baseline evaluations of liver function.
During treatment with Tegretol, the following laboratory procedures should be performed:
1. Complete blood and platelet counts should be done at intervals of one week during the first month of drug treatment, every two weeks during the second and third months, and at monthly intervals thereafter for as long as the patient is taking the drug. A trend toward a decreasing white blood cell count should suggest a dosage reduction and more frequent laboratory and clinical evaluations. Should this trend continue, the drug should be discontinued.
2. Liver function tests must be performed at regular intervals during treatment with this drug since liver damage may occur during therapy. The drug should be discontinued immediately in cases of aggravated liver dysfunction or active liver disease.
3. Periodic eye examinations, including slit-lamp, funduscopy and tonometry, are recommended for patients being treated with this drug since many phenothiazines and related drugs have been shown to cause eye changes.
4. Complete urinalysis and BUN should be done on patients treated with Tegretol because of observed renal dysfunction.
Adverse Reactions Dizziness, drowsiness, unsteadiness on the feet, nausea, vomiting, aplastic anemia, transitory leukopenia, agranulocytosis, eosinophilia, leukocytosis, thrombocytopenia, purpura, abnormalities in liver function tests, cholestatic and hepatocellular jaundice, urinary frequency, acute urinary retention, oliguria with elevated blood pressure, albuminuria, glycosuria, elevated BUN, microscopic deposits in the urine, impotence, disturbances of coordination, confusion, headache, fatigue, blurred vision, transient diplopia and oculomotor disturbances, speech disturbances, abnormal involuntary movements, peripheral neuritis and paresthesias, depression with agitation, talkativeness, nystagmus, tinnitus, paralysis and other symptoms of cerebral arterial insufficiency, pruritic and erythematous rashes, urticaria, Stevens-Johnson syndrome, photosensitivity reactions, alterations in skin pigmentation, exfoliative dermatitis, alopecia, diaphoresis, recurrence of thrombophlebitis, erythema multiforme and nodosum, aggravation of disseminated lupus erythematosus, gastric distress, abdominal pain, diarrhea, constipation, anorexia, dryness of the mouth and pharynx, glossitis, stomatitis, fever, chills, adenopathy, lymphadenopathy, aching joints and muscles, leg cramps, conjunctivitis, left ventricular failure, aggravation of hypertension, hypotension, syncope and collapse, edema, aggravation of coronary artery disease and congestive heart failure. (Whether these cardiovascular effects are drug-related is not known. However, some of these complications have resulted in fatalities.) The necessity for discontinuing the drug should be dictated by the gravity and severity of the adverse reactions.
Dosage and Administration The drug should always be taken with meals, if possible.
Initial: One-half tablet (100 mg.) b.i.d. on the first day. Thereafter, the dose should be increased in one-half tablet (100 mg.) increments every 12 hours until freedom from pain is achieved. To relieve pain, between 200 mg. and 1200 mg. per 24 hours may be necessary.
Maintenance: Initial control of pain can be maintained in most patients with a dose of 400 mg. to 800 mg. daily. Maintenance doses may range between 200 mg. and 1200 mg. daily.
At least once every 3 months during treatment period attempts should be made to discontinue the drug or to reduce the dose to the minimum effective level.
Availability Round, white, single-scored tablets of 200 mg. in bottles of 100 and 1000. (B)46-820-A

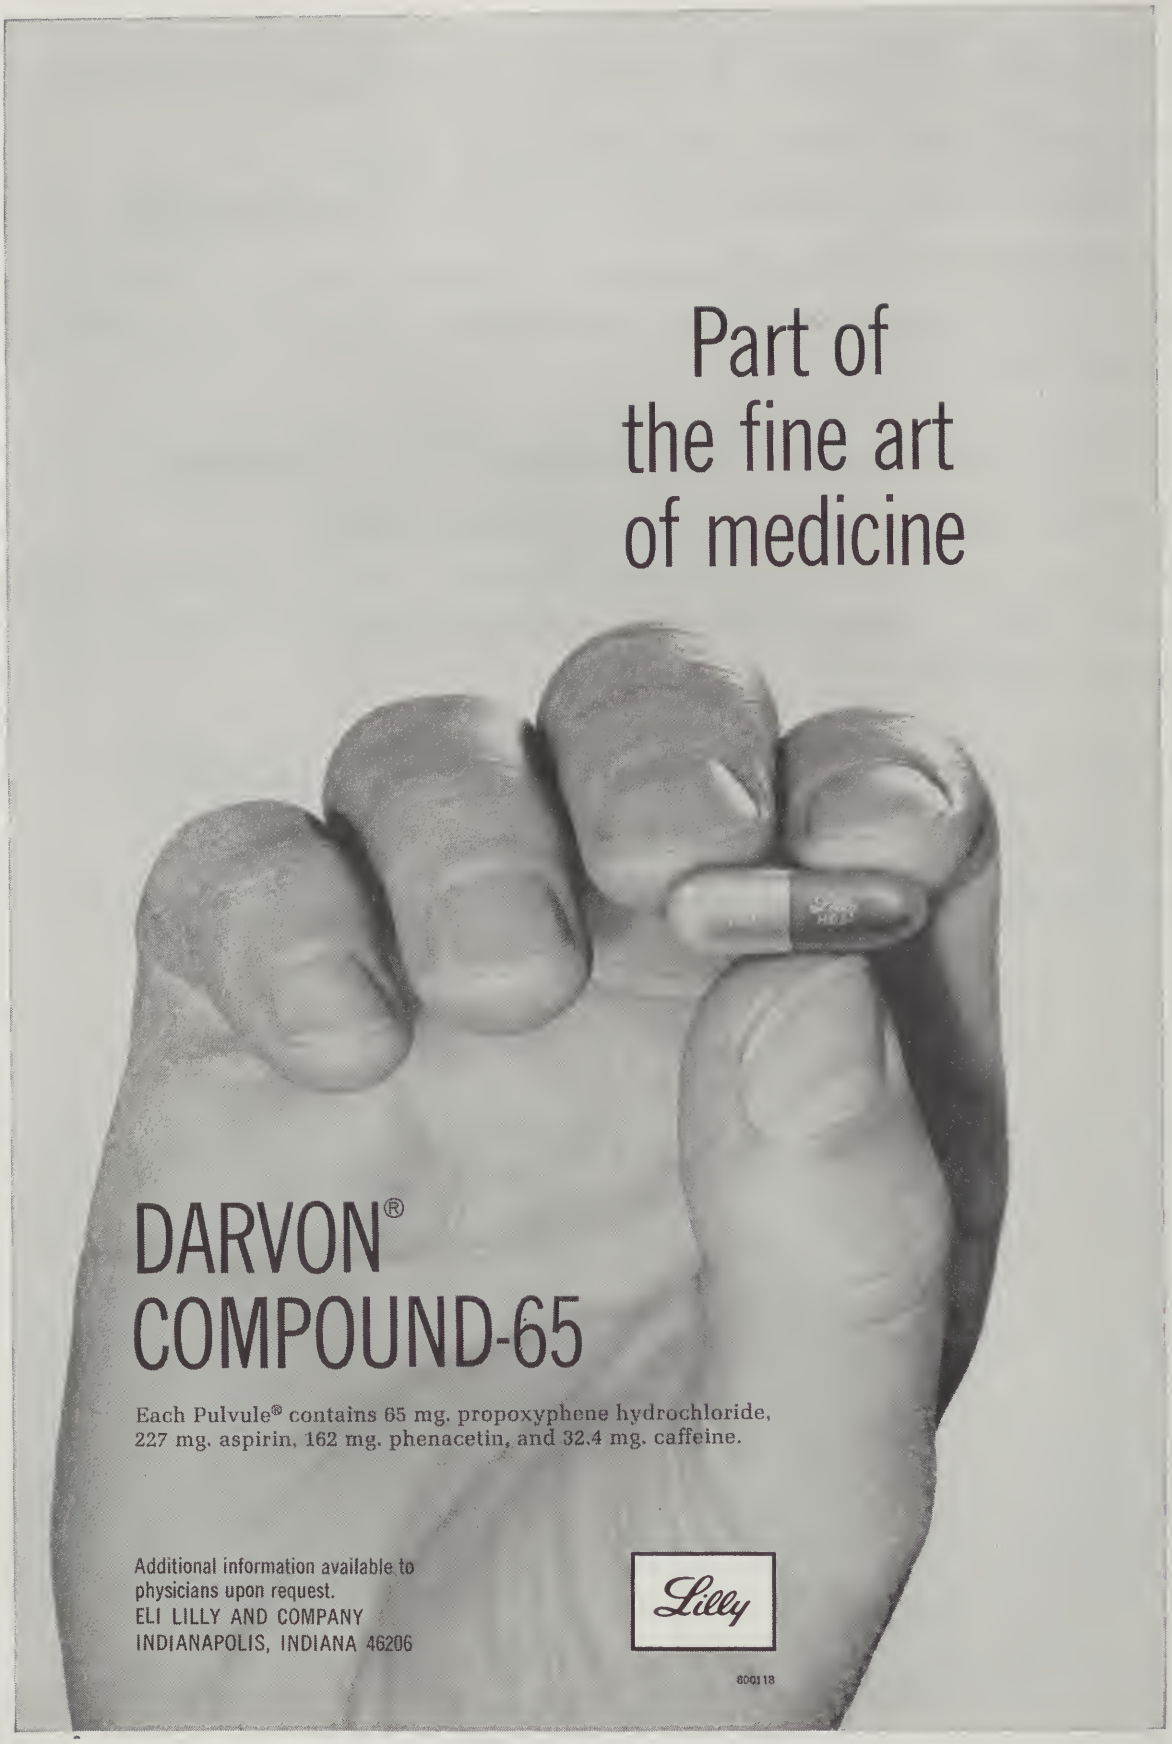
Geigy

uncommon relief of uncommon pain

Grounds...for Regroton®

chlorthalidone 50 mg.
reserpine 0.25 mg.

when you want to provide the combined benefits of two accepted agents in the treatment of mild to moderate hypertension. (Contraindications: history of mental depression, hypersensitivity, and most cases of severe renal or hepatic diseases.)



when you want to prescribe therapy that is generally well tolerated.
(However, adverse reactions may occur. For a complete listing, please refer to the full prescribing information which is summarized below.)

when your patient wants an easy-to-remember and reasonably priced regimen. (One tablet a day usually costs about a dime.)

Indications: Hypertension. **Contraindications:** History of mental depression, hypersensitivity, and most cases of severe renal or hepatic diseases. **Warning:** With the administration of enteric-coated potassium supplements, which should be used only when adequate dietary supplementation is not practical, the possibility of small-bowel lesions (obstruction, hemorrhage, and perforation) should be kept in mind. Surgery for these lesions has frequently been required and deaths have occurred. Discontinue coated potassium-containing formulations immediately if abdominal pain, distention, nausea, vomiting, or gastrointestinal bleeding occur. Discontinue 1 week before electroshock therapy, and if depression or peptic ulcer occurs. **Use in pregnancy:** Regroton should be used in pregnant patients or in women of childbearing potential only when, in the judgment of a physician, its use is deemed essential to the welfare of the patients; adverse reactions (thrombocytopenia, hyperbilirubinemia, altered carbohydrate metabolism, etc.) are potential problems in the newborn. **Precautions:** Antihypertensive therapy with Regroton should always be initiated cautiously in post-sympathectomy patients and in patients receiving ganglionic blocking agents, other potent antihypertensive drugs, or curare. Reduce dosage of concomitant antihypertensive agents by at least one-half. To avoid hypotension during surgery, discontinue Regroton therapy two weeks prior to elective surgical procedures. In emergency surgery, use, if needed, anticholinergic or adrenergic drugs or other supportive measures as indicated. Because of the possibility of progression of renal damage, periodic kidney function tests are indicated. Discontinue if the BUN rises or liver dysfunction is aggravated. Hepatic coma may be precipitated. Electrolyte imbalance, sodium and/or potassium depletion may occur. If potassium depletion should occur during therapy, Regroton should be discontinued and potassium supplements given, provided the patient does not have marked oliguria. Take particular care in cirrhosis or severe ischemic heart disease and in patients receiving corticosteroids, ACTH, or digitalis. Salt restriction is not recommended. Use cautiously in patients with ulcerative colitis or gallstones (biliary colic may be precipitated). Bronchial asthma may occur in susceptible patients. **Adverse Reactions:** The drug is generally well tolerated. The most frequent side effects are nausea, gastric irritation, vomiting, diarrhea, constipation, muscle cramps, headache, dizziness and acute gout. Other potential side effects include angina pectoris, anxiety, depression, bradycardia and ectopic cardiac rhythms (especially when used with digitalis), drowsiness, dull sensorium, hyperglycemia and glycosuria, hyperuricemia, lassitude, restlessness, transient myopia, impotence or dysuria, orthostatic hypotension which may be potentiated when chlorthalidone is combined with alcohol, barbiturates or narcotics, leukopenia, aplastic anemia, skin rashes, thrombocytopenia, agranulocytosis, nasal stuffiness, increased gastric secretions, nightmare, purpura, urticaria, ecchymosis, weakness, uveitis, optic atrophy and glaucoma, and pruritus. Eruptions and/or flushing of the skin, a reversible paralysis agitans-like syndrome, blurred vision, conjunctival injection, increased susceptibility to colds, dyspnea, weight gain, decreased libido, dryness of the mouth, deafness, anorexia, and pancreatitis when epigastric pain or unexplained G.I. symptoms develop after prolonged administration. Jaundice, xanthopsia, paresthesia, photosensitization and necrotizing angiitis are possible. **Average Dosage:** One tablet daily with breakfast. **Availability:** Pink, single-scored tablets in bottles of 100 and 1000. **For details, see complete Prescribing Information.** (B)46-600-B

THE MONTH IN WASHINGTON

The federal government has established a new agency and appointed two new advisory committees in the health care field.

The new agency is the National Center for Health Services Research and Development. The committees are:

1. The Medical Assistance Advisory Council that will advise the secretary of Health, Education and Welfare on matters relating to federal-state medical aid programs.

2. A panel to give the social security commissioner advice on experiments to find new methods of reimbursing hospitals and physicians for health care under medicare and other federal health programs.

Health, Education and Welfare spokesmen said the new center will work with universities, industry, hospitals, practitioners and research institutions to seek new ways of delivering health care. The new center was authorized by Congress last year at the Johnson Administration's request.

"The ultimate goal of the center is to aid practitioners and institutions involved in health services to improve the distribution and quality of services and to make the best possible use of manpower, funds, and facilities," said Philip R. Lee, MD, assistant HEW secretary for Health and Scientific Affairs.

The immediate goals of the center were listed as:

☐ More efficient utilization of health personnel, including the development of new types of health workers at the professional, technical and auxiliary levels.

☐ Increased productivity and better management of all elements of the medical care system to improve quality and moderate rapidly rising costs.

☐ Technological innovation, for immediate application, to achieve cost reduction and quality improvement.

☐ To survey and analyze health systems, including costs and financing and to test new concepts and systems of health care delivery.

☐ To recruit, train and develop personnel for health services research, including the establishment of regional, non-Federal centers for health services research and training.

☐ Collection and correlation of existing information on health services delivery for planning and organization design.

☐ Initiation of systems' studies of institutional design, construction, equipment and maintenance and support construction of cost-saving innovations.

Director of the center, which is under the newly created Health Services and Mental Health Administration, is Paul J. Sanazaro, MD, who had directed education and medical care research for the Association of American Medical Colleges since 1962.

HEW said the advisory council would be consulted on program development and practical operational problems involved in Medicaid (Title XIX of Social Security). Such programs are in operation in 38 states, Guam, Puerto Rico and the Virgin Islands. Rashi Fein, PhD, a chief economist at the Brookings Institution, was named chairman of the 21-member council which includes six physicians: John B. Farley, Pueblo, Colo.; Thomas B. Georges, Pennsylvania health and welfare official; Amos N. Johnson, Garland, N. C.; Maynard Shapiro, Chicago, president-elect of the American Academy of General Practice; George W. Slagle, Battle Creek, Mich., chairman of the American Medical Association's Council on Medical Service, and Donald Smith, public health professor at the University of Michigan.

The Social Security Administration said the reimbursement panel would review proposals for experiments submitted by institutions and individuals in the health care and health insurance fields. After such reviews, it will be asked to recommend the ones it believes to have the greatest potential.

Nathan J. Stark, a Kansas City, Mo., businessman is chairman of the 17-member group. Four members are physicians: Solomon J. Axelrod, University of Michigan; Thomas W. Georges, Jr.,

Pennsylvania welfare official; Donald R. Hayes, Springfield, Mass. and Pierre J. Salmon, San Mateo, Calif., county public health and welfare official.

* * * *

The American Medical Association urged that Congress appropriate maximum amounts for support of medical education.

The AMA position was outlined by C. H. William Ruhe, MD, director of the AMA's division of medical education, at a hearing of a House appropriations subcommittee.

"We recognize the present concern of the Congress and the nation for an overall reduction in federal expenditures," Dr. Ruhe said. "However, we believe that the urgent need for more physicians merits the funding, to the fullest extent possible, of legislation supporting medical education . . .

"An urgent need exists in this country for more physicians to meet the health care needs of the American public. This need can only be met effectively by a major increase in the capacity of American medical schools to educate more physicians."

Dr. Ruhe noted that Federal aid to medical schools under the proposed Health Manpower Act of 1968 would not become available before 1970. Therefore, he said efforts must be made to secure the essential immediate increase in financial support through increased appropriations under existing law. He listed the Health Professions Educational Assistance Act, the Health Research Facilities Construction Act, the Medical Act, and the general research support authority of the National Institutes of Health.

Gov. Nelson Rockefeller of New York and two other witnesses at a Senate subcommittee hearing supported national compulsory health insurance as a solution of the problem of rising health care costs.

The other witnesses were Olcott D. Smith, chairman of Aetna Life and Casualty Company, who expressed belief that private companies could work with the government effectively on such a program, and economist Victor Fuchs.

But Wilbur J. Cohen, Secretary of Health, Education and Welfare who favored the plan 20 years ago, said he now believes the government should move on other fronts. He said it would be difficult—a "monumentable task"—at this time

to achieve a workable and acceptable program of compulsory national health insurance. He did not foresee the United States following the pattern of European nations in adopting a monolithic central health system for the entire nation. He said this country is too large for a single plan but that the benefits under any various plans adopted should be relatively uniform for all Americans.

Cohen said first priority now should be given maternal and child health programs. He listed as other "must" programs the expansion of medical manpower and health facilities and the continued investment in health research.

Sen. Abraham Ribicoff (D.Conn), chairman of the subcommittee holding hearings on health care costs, also said that the emphasis now should be on more immediate solutions. He said that his experience with the fight over medicare had convinced him that it would be a long time before Congress would accept compulsory national health insurance.

He said that the first week of the hearings "made clear that a health care system in America must include everyone—public and private organizations, insurance companies, the Blues, the voluntary hospitals, nursing homes, medical societies, individual private practitioners, those who practice medicine in groups, and state, local and federal agencies."

Manufacturers of oral contraceptives are being asked by the Food and Drug Administration to revise uniform labeling for the products to reflect findings from research in Great Britain that there is an association between the use of oral contraceptives and thromboembolic diseases.

Herbert L. Ley, Jr., MD, director of the FDA's Bureau of Medicine, notified the manufacturers of the publication of the British reports in the April 27 issue of the *British Medical Journal*. He called the companies to a Washington meeting for discussion of "prompt revision of uniform labeling."

Proposed labeling changes, based on preliminary results and unofficial reports of the British findings, had been submitted to U.S. manufacturers by the FDA last month.

The proposed new FDA labeling would reflect the findings of the British studies and would be aimed at prescribing physicians, an FDA spokesman said.

IN BALTIMORE.....

House In The Pines Nursing Homes have the facilities and experience to care for those you care for

HOUSE IN THE PINES
NURSING HOMES

PROFESSIONAL CARE FOR THE AGED, CHRONICALLY ILL AND CONVALESCENT.

• Bright, pleasant surroundings and a home-like atmosphere • Fire-safe accommodations • Competent professional care, 24 hours a day • Complete Physical and Occupational Therapy facilities and programs under the direction of our licensed staff therapists

• Modern kitchens supervised by licensed staff dietitian provide tasty, balanced meals.
